The real advantage of the barrel engine appears when designs for engines of 400 h.p. or more are considered. If such engines can be made then they will fit into fuselages as neatly as do our highest powered water-cooled racing engines of to-day.

There are undoubtedly immense possibilities for engines of this type, and consequently anything new in this direction must obviously be of considerable interest.

A swash-plate on original lines has recently been introduced to certain people in the English Aircraft Trade by Mr. K. K. Turner, an Australian engineer who is in England partly on business and partly on holiday.

Mr. Turner was an officer in the R.F.C. during the War. He was shot down and spent the last year or so of the War in various prison-camps in Germany, including the famous Klausthal Camp. Late in 1918 he escaped, and after numerous exciting adventures, including stealing a fishing-boat and sailing it single-handed up the Baltic for three days without food or water, he landed in Denmark on the day of the Armistice.

As a matter of purely personal interest, he was in the same prison-camp with Sq. Ldr. Reid, the inventor of the famous Turn Indicator and of the Reid Aptitude Indicator for testing pilots. By a curious coincidence they met at THE AEROPLANE stand at Olympia during the Aero Show for the first time since they had tried to escape together from Germany.—C. G. G.

The following notes explain how the "X" engine converts presumably, because its obviously important possibilities are still an unknown quantity—has been contributed by Mr. Turner.

The following notes explain how the "X" engine converts the reciprocating motion of a piston into the rotary motion of a shaft, and at the same time effects a speed reduction between the cycle of operation of the piston and the final revolution of the shaft. The ratio may be 1 : 1 or if desirable any ratio up to infinity.

Fig. 1 shows a 6 h.p. demonstration engine operating on compressed air incorporating a 5 : 1 ratio,—that is to say, the pistons operate at 2,500 cycles per minute and the shaft O rotates at 500 revolutions per minute.

Fig. 2 shows the engine in its two main components. All that is necessary to accomplish this is to remove set screws T, and the engine is open for inspection. Nothing in the mechanism is disturbed by doing this.

Fig. 3 shows the oscillating member with the piston as-

FIG. 1.—A 6 h.p. Turner Compressed-air wobble-plate engine.

FIG. 2.—The two main components of the small 6 h.p. Turner compressed-air engine.

sembly removed from the cylinder block. This only necessitates the removal of nut S. Ease of assembly and dissembly is a great feature of this machine.

METHOD OF OPERATION.

The power impulses in the cylinders cause the pistons to reciprocate. They in turn impart an oscillating or undulatory movement to the oscillating member K. This undulatory movement is a rolling motion, and causes the ring of teeth A to roll on the ring of teeth B, which is bolted to the casing I.

These two rings A and B have the same number of teeth, so that at the finish of each complete roll, during which each piston has made one complete reciprocation, the oscillating member K has returned to its original position.

In the same manner the ring of teeth C rolls on the ring of teeth D. But in this case the ring C has 42 teeth and the ring D has 35 teeth, so it follows that the ring D is displaced 42 minus 35 (=7) teeth for each complete roll of the oscillating member K.

As there are 35 teeth in the ring D, it follows that it requires 35 divided by 7 (=5) complete rolls of the oscillating member K to rotate the ring D one revolution.

This ring D is attached to the shaft O. The thrust of the pistons is carried in the following manner:—The concave surface E corresponds to the pitch cone of the gear C and rolls on the convex surface F which corresponds to the pitch cone of the gear D. There is no sliding, as these surfaces are the rolling cones of the gears C and D, and the thrust is taken from the surface F by means of the shaft O to the casing I, by an ordinary ball-thrust bearing.

In larger engines these thrust-surfaces are incorporated with the rings A and B, and the thrust is then imparted direct to the casing I. The skew shaft L, on which is mounted on ball bearings the oscillating member K, makes one complete revolution for each complete oscillation of the member K.

No loads are borne by this shaft other than those developed by the power required to operate the valve mechanism.

There is no departure from standard practice on the cylinder end of the engine, except that the cylinders are arranged in a circle instead of in a straight line, or radially.

The valve operating mechanism is substantially the same as that used on standard radial engines, and the principle may be adapted for use with either petrol or crude oil. If crude oil be used, the same type of fuel injection mechanism as is used in any other engine may be adopted. Further, in high-powered engines banks of cylinders may be arranged on both sides of the oscillating member. ?

FIG. 3.—The oscillating member with the piston assembly removed from the cylinder-block.

ADVANTAGES.

The great advantages claimed for the "X" engine for aircraft propulsion may be summarised as follows:—

(1) All surfaces under load are in rolling contact, giving the minimum of friction and the maximum freedom from lubrication difficulties.

(2) The airscrew can be designed to suit the operating conditions of the aircraft, without having to study the engine revolutions, and the correct gear ratio can be incorporated in the engine to make the engine revolutions harmonise with the required airscrew revolutions.

(3) The "X" engine is suitable for either air, fluid or water cooling and in either case gives an engine with a very low frontal area and therefore far less head-resistance than the engines of to-day. In fact, it is in itself almost streamline in form.

(4) As may be seen from the foregoing description, the assembly and dissembly of the engine is simplicity itself. There are no parts on the engine that require any hand-fitting.

(5) The "X" engine enables perfect dynamic balance to be achieved.

(6) The weight-to-power ratio of the "X" engine is extremely good, for two reasons. The engine functions as a high-speed, and therefore a light-weight, machine, but is further enabled to produce a high tractive effort as it is able to rotate the airscrew at its most efficient speed.

(7) The engine readily lends itself to standardisation. In an engine of a certain power, for example, say, 100 B.h.p., the pistons, casings, valve mechanism, and etc., can remain identical and by varying the ratio of the teeth in the rings C and D, the final airscrew shaft-revolutions may be varied to suit the airscrew of the particular machine to which it is being applied, an advantage beyond attainment by present day engines. *This necessitates no alterations, except in the rings C and D.*

EFFICIENCY.

The efficiency of this mechanism is very high. This is due probably to two facts more than any other, namely, that all parts under load are in rolling contact with other parts, and as the connecting rods have practically no angularity there are no side-thrusts to be taken up on the cylinder-walls or cross-heads, which create a large amount of the frictional loss in an ordinary type of engine.

DURABILITY.

Owing to freedom from lubrication difficulties, this mechanism has proved to be more than ordinarily durable.

Another feature which is of great assistance from this aspect is the fact that the whole of the inertia forces are absorbed in the oscillating member itself, and are not imparted to the main transmission bearings.

The relative slowness of the rubbing velocity in the connections between the pistons and the oscillating member further eliminates any difficulties at these points.

In the engine illustrated the reader may notice that two different types of connecting-rod joints are illustrated, one a double gudgeon-pin joint and the other a ball-type joint. The designers have found from experimental work that, where the forces in the rod are always of a compressive nature, the ball type of joint is the simpler and the better of the two, but where the forces in the connecting-rod change sign, as in an ordinary double-acting steam or four-cycle internal-combustion motor, a departure has to be made from this type of joint and the one illustrated on the piston end of the connecting-rod has to be used.

SAVING IN FIRST COST.

The saving on the cost of construction is particularly noticeable in the case of the larger engines. In the first case a simple disc replaces the long and awkwardly shaped crank-shaft.

In the larger engines this disc can be fabricated from ordinary steel plate by either riveted or welded construction, and in the small engines from a single steel pressing. A disc of this type is eminently suited for carrying the loads to which it is subjected, whereas the crank-shaft, with its old and awkward shape, presents difficulties during forging and machining, and when finished has to be maintained with all its bearings in accurate alignment.

Further, as the general design of the engine is studied, the reader will realise how extraordinarily the metal disposes itself to carry the stresses which are imparted to it. This is much more so than in the ordinary type of engine.

Most commercial applications require a reasonably slow speed on the final shaft. Which means that unless a reduction gear is incorporated between the means supplying the power and the shaft, the power-unit has to be of the massive slow-speed type. This is not so in the case of the "X" engine as it combines the high-speed light-weight engine with the desired slow-speed output without its high initial cost.

Further, no great essential accuracy in its manufacture is required to produce excellent results. In fact a 50 h.p. steam winch has been constructed on this principle, with all its gears cast, and it gave excellent results without the gears being machined or hand-finished in any way.

Running engines at a high speed might be thought advisable, but, on examination, the main difficulties in the older types will be found to have been created by the inertia forces generating excessive side-thrusts, with consequent loss due to the angularity of the connecting rods. This does not happen with the "X" engine.

This principle of force-conversion has been thoroughly tried out. Large heavy-duty pumps are in successful operation. The largest set is at Bairnsdale, in the State of Victoria, Australia, where electrically driven pumps capable of delivering 50,000 gallons per hour against a total head of 350 feet are in operation by the Victorian Government, and during practical tests under actual working conditions these pumps gave an overall efficiency of 90% from the pump coupling to actual water horse power output.

FLOATS FOR THE MOTH AT HOME AND ABROAD.

The ubiquitous D.H. Moth is in use all over the World as a seaplane. Not only is the Moth used for training but for Forestry Patrol and the Fire-fighting, Seal-spotting and other work in connection with fishing. In Sarawak use is made of the machine for Government Liaison and the Sir Douglas Mawson Expedition is taking one to the South Pole.

As a result of this popularity, the making of floats for this machine is quite a production job. In England Short Bros., of Rochester, have made a good many score pairs of floats for the De Havilland Aircraft Company Ltd.

In America, the first Moth seaplane, built by the Moth Aircraft Corporation, Lowell, Mass., has been equipped with floats of all-metal construction, built and designed by the

STANDARDISED METAL FLOATS.—Two of the eight standard sizes of metal floats made by the Edo Aircraft Corporation of College Point, Long Island, New York.

SHORT METAL FLOATS.—A view of the Float Shop of Short Bros. at Rochester showing Moth floats in various stages of construction.

Edo Aircraft Corporation, College Point, Long Island, N.Y. The Moth had a 85/100 h.p. Gipsy engine.

Take-off time with only the pilot on board was 12 seconds. With pilot and passenger the time was increased to 14 seconds. A run was finally made with the engine throttled back to 55% of its power and the Moth with both pilot and passenger aboard succeeded in taking off in one minute fifty-five seconds.

In Finland the Government Aircraft Works have produced a set of wooden floats for the D.H. Moth and as a result of successful trials, 100 pairs are to be built.

These Finnish-built floats are of 3-ply which has been especially treated to reduce soakage. The upper surface of the floats have a curve of constant radius from nose to stern. The forebody appears to have the normal concavely-curved undersurface. To obviate the difficulty of bending the 3-ply in more than one plane, the chine-lines of the after-body run straight from the step to the aftermost point of the deck. For the same reason, although the keel of the after-body slopes up towards the sternpost at the normal angle, the sternpost rakes aft. These floats though nine pounds heavier than their metal counterparts, can be produced in Finland for half the cost.

The floats built by the Edo Aircraft Corporation are the second smallest size in their standard range of eight types. This range is from 1,100 lbs. to 5,100 lbs., and in each category the floats have a Reserve Buoyancy of over 100%.

The flat tops of these floats offer special advantages for getting in and out of the machine to which they are fitted. One has a specially stiffened surface on which to walk with no tendency to slide off.

The Edo floats are built of anodically treated duralumin sheet rivetted over a structure of extruded duralumin angles. These floats have flat tops, fairing through a constant radius to the flat sides, which have a marked tumble home.

There appears to be no panel-beating except for the nose cap.

The bottoms appear to be concave Vees forward of the step with a flat Vee aft. The concave Vee bottom is shown in drawings as changing into two further curves making a section at the step of four concave curves. The floats are built with water-tight bulkheads, and mooring cleats. In Canada the Aircraft Dept. of General Auto Body Ltd. are producing floats for D.H. Moths, though no information is available as to the methods of construction employed.

Short Bros., who have specialised in the production of all-metal floats for seaplanes, have been producing for some time now standard floats for D.H. Moths. These floats may also be fitted to machines with a similar performance and weight.

These Short floats have only reached their present high efficiency after extensive model tests made on the firm's experimental tank. These trials have resulted in a float shape which offers minimum resistance on the water and in the air.

The forebody of the Short float has the normal concave surface on its underside, aft of the step the bottom is of Vee section with a slowly decreasing included angle. The top surface is a rounded section and is of streamline form.

The internal structure consists of bulkheads and longitudinals made up from duralumin sheet. The keelson is made from members folded to shape and rivetted to the bulkheads. To add lightness and stiffness flanged holes are punched in these intercostals. To increase the stiffness of the bottom further intercostals are added between the keelson and chine angles. The upper portion of the floats have angle stiffeners between the bulkheads.

The whole float is then covered with duralumin sheet. The only panel-beating is at the extreme nose-portion and the stern-piece. The float fittings which are die-cast are attached to troughs which form part of the top-skin. No packing material is used, water-tight rivetting of adequate pitch being quite satisfactory.

To the nose of each float is attached a mooring eye of stainless steel. Each watertight section of the float, and there are four, have special arrangements for draining. In the bottom of each float is a removable screw of stainless steel. On the top of the float over each compartment is a neat fitting to which a force pump can be attached. These fittings have suction pipes down to the bottom of the compartment. Besides these devices there are the usual inspection covers.

A SINGLE-WHEEL AMPHIBIAN.

In 1924, Mr. Grover Loening, of the Loening Aeronautical Engineering Corporation, of New York, applied for a patent for a single-wheel amphibian landing-gear.

In 1926, the Army Air Corps equipped an old training landplane with a single-wheel landing gear based on the Loening patents, and tests with this machine proved that the device was fundamentally sound. This machine took-off and landed with ease, and showed no inclination to turn over on the ground.

As the result of these tests, the U.S. Army Air Corps Engineering Division placed an order with the company in 1927 for one experimental Loening Amphibian incorporating the single landing wheel device.

This machine was test flown by Lieut. Julian B. Hadden, of the Test Division, Wright Field, Dayton, Ohio, on June 27, 1929, and it was immediately accepted by the Air Corps.

In the meantime, Mr. Loening applied his patent to his own privately-owned D.H. Moth. This machine has been tested by Mr. B. Allison Gillies, the chief test pilot of the Loening Company, and has proved to be very successful.

The Moth amphibian gear consists of a single-step central float, 17½ ft. long by 30 in. wide, and two wing-tip floats, all of a simple welded duralumin construction. Forward of the step is mounted the central wheel which rides up and down in a water-tight box similar to the centre-board box in a yacht. The mechanism to raise and lower the wheel consists of two toggle-levers so hinged that when the wheel is out the toggles are locked and support the full load of the machine when landing. This device is balanced with springs so that the operation of raising and lowering the wheel by a lever in the cockpit is rapid and light. When the wheel is raised two hinged flaps close

Digitized by Google

AFLOAT.—The Loening XO-10 with the 500 h.p. Wright Typhoon inverted twelve-cylinder air-cooled engine.

behind the wheel and seal the hole in the bottom of the float. The wheel is sprung on compression rubber discs.

The two wing-tip floats are fitted with two long skids which swivel on the noses of the floats.

The Moth with the Loening amphibian gear weighs 1,020 lb. empty. The Moth so fitted shows a top speed which is only 4 m.p.h. less than the standard land Moth.

The Loening amphibian with the single-wheel landing device is known as the XO-10 and is an experimental observation aircraft which, in addition to the one-wheel landing gear, is fitted with the new Wright Typhoon inverted twelve-cylinder air-cooled Vee engine which develops 500 h.p. at 2,000 r.p.m.

Under test this machine handled very well in the air, and the pilot was able to taxi in any direction on both land and water. Its characteristics are no different from those of the standard two-wheeled Loening amphibians. On land it stays on nearly an even keel owing to the long wing-tip skids, each of which has a small wheel at its tip Taking off on land, the machine runs on the main wheel and on one or the other wing-tip skid until about 25-30 m.p.h. is reached. After this the machine runs and takes-off from its single central wheel. The single wheel eliminates a quantity of external bracing and resistance and prevents the danger of damaging the machine should a pilot forget to retract his wheel before alighting.

The new inverted air-cooled power-plant is almost completely cowled in, and, apart from its comparatively small frontal area, provides excellent visibility for the pilot.

SPECIFICATION.

TYPE.—Two-seat observation amphibian.

WING.—Two-bay slightly staggered biplane. Upper wings in two sections joined together over an inverted Vee cabane. Lower wings, of bigger span than the upper wings, mounted high up the side of the body. Two sets of "N" type interplane struts on either side of the body. Wing structure consists of two spruce spars and "Alclad" ribs, the whole being fabric-covered. Ailerons on lower wings only.

FUSELAGE AND HULL.—Typical Loening amphibian structure of all-duralumin construction. Main members are of specially designed extruded duralumin sections with "Alclad" duralumin sheet bolted to the structure.

TAIL UNIT.—Monoplane type of standard Loening type and construction. Adjustable tail-plane operated by torque tubes and bevel gears from the pilot's cockpit.

LANDING GEAR.—One central 40in. by 10in. wheel operating vertically in a water-tight box in bottom of hull in advance of the main-step. Wheel is retracted by worm-gear in pilot's cockpit. Two small positively operated doors close the hole in the bottom when the wheel is retracted. Lateral balance is provided by skids on the noses of the wing-tip floats. The tail-skid is of the standard Loening type, with rubber-disc springing.

POWER-PLANT.—One 500 h.p. inverted Wright Typhoon twelve-cylinder Vee air-cooled engine. Main fuel tank of 140 U.S. gallons (=117 Imp. gals.=530 litres) in body. Two-blade Standard Steel air-screw and Eclipse electric inertia-starter.

ACCOMMODATION.—Pilot's cockpit under the upper wings with an observer's cockpit well aft of the wings. Back cockpit equipped with standard Lewis-gun ring. Also has a folding seat for use when operating the auxiliary control or the wireless spotting equipment. A large photographic hatch is installed in the bottom of the hull for the use of the standard Air Corps tri-lense mapping camera. A water-tight plug seals this opening when alighting on the water.

DIMENSIONS.—Span 46 ft. 3 in. (14.1 m.), Length 35 ft. (10.67 m.), Height 12 ft. 11 in. (3.94 m.), Chord 6 ft. (1.83 m.), Wing area 494 sq. ft. (45.8 sq. m.).

WEIGHTS AND LOADINGS.—Weight empty 3,200 lb. (1,450 kgs.), Disposable load 1,900 lb. (863 kgs.), Weight loaded 5,100 lb. (2,313 kgs.), Wing loading 10.3 lb./sq. ft. (50.4 kgs./sq. m.), Power loading 10.6 lb./h.p. (4.8 kgs./h.p.).

PERFORMANCE.—Not available until released by U.S. Air Corps.

ASHORE.—The Loening XO-10 single-wheel amphibian on land showing the central wheel between the flaps which close the hole when the wheel is retracted and one of the wing-tip skids armed with a small wheel.

THE HEINKEL H.D.16.—A torpedo-bomber (675 h.p. Armstrong Siddeley Leopard engine) equipped as a seaplane.

THE HEINKEL H.D.16.

DESIGNERS.—Ernst Heinkel Flugzeugwerke G.m.b.H., Warnemünde.

CONSTRUCTORS (under licence).—Svenska Aero A.B., Stockholm.

TYPE.—Two-seat torpedo-bombing land or seaplane.

WING.—Equal-winged single-bay unstaggered biplane. Top centre section carried above fuselage by steel-tube struts welded to fuselage and arranged in form of "W" when viewed from front and "N" when seen from side. Bottom centre-section of steel tubes welded to fuselage and braced to top longerons of fuselage by "N" struts. Outer wing sections of wood covered with fabric and interconnected by one set of "N" type struts on either side. Wing structure consists of two spruce and plywood box spars, box-type ribs and steel-tube compression members, the whole being covered with fabric. Ailerons to all four wings.

FUSELAGE.—Welded steel-tube structure covered with aluminium cowling forward and fabric aft.

TAIL-UNIT.—Normal monoplane type. Welded steel-tube framework covered with fabric. Adjustable tail-plane. Controls for rudder and elevator by cable over ball-bearing pulleys and are duplicated. All controls internal.

UNDERCARRIAGE.—Divided type. Each unit consists of two Vees one under fuselage longerons and one at extremity of bottom centre section. Front leg of outer Vee has also suspension and top and bottom of this leg is connected to apex of inner Vee by bracing tube and axle respectively. Wheel undercarriage interchangeable with float gear.

FLOATS.—Two long single-step wooden floats. Each attached to bottom centre-section root by two sets of "N" type struts in form of inverted Vee. The inner bases of each strut attachment to the float is again braced to the bottom fuselage longeron by inclined struts.

POWER-PLANT.—One 675 h.p. Armstrong-Siddeley Leopard 14-cylinder radial air-cooled engine. Main fuel tanks in centre-section.

ACCOMMODATION.—In front of wings is the pilot's cockpit. Beside and slightly to rear of pilot's seat is a seat for the engineer or navigator. If used for freight-carrying purposes, a compartment 3 m. long is provided behind pilot's cockpit with door at rear behind wings. Provision for a back gunner's cockpit is made midway between wings and tail.

DIMENSIONS.—Span 18 m. (59 ft.), Length (Landplane) 12.5 m. (41 ft.), Length (Seaplane) 13 m. (42 ft. 7 in.), Height (Landplane) 4.6 m. (15 ft. 1 in.), Height (Seaplane) 5.2 m. (17 ft. 1 in.), Wing Area 96.9 sq. m. (1,042 sq. ft.).

WEIGHTS AND LOADINGS.—Landplane: Weight empty 2,170 kgs. (4,780 lb.), Weight loaded 4,170 kgs. (9,200 lb.), Wing loading 43.2 kgs./sq. m. (8.8 lb./sq. ft.), Power loading 6.2 kgs./h.p. (13.7 lb./h.p.).

WEIGHTS AND LOADINGS.—Seaplane: Weight empty 2,570 kgs. (5,670 lb.), Weight loaded 4,570 kgs. (10,080 lb.), Wing loading 47.2 kgs./sq. m. (9.7 lb./sq. ft.), Power loading 6.8 kgs./h.p. (15 lb./h.p.).

PERFORMANCE.—Landplane: Speed max. 190 km.p.h. (118 m.p.h.), Landing speed 86 km.p.h. (53.4 m.p.h.), Climb to 1,000 m. (3,280 ft.), 6 mins.

PERFORMANCE.—Seaplane: Speed max. 180 km.p.h. (112 m.p.h.), landing speed 90 km.p.h. (56 m.p.h.), climb to 1,000 m. (3,280 ft.), 7.5 mins.

THE HEINKEL H.D.43.

CONSTRUCTORS.—Ernst Heinkel, Flugzeugwerke, G.m.b.H., Warnemünde.

TYPE.—Single-seat fighter biplane.

WINGS.—Unequal span single-bay staggered biplane. Centre-section carried above fuselage on "N" type steel-tube struts, welded to fuselage structure. Centre-section of thinner section than outer sections to enhance pilot's view. Top outer sections have 3 deg. and bottom outer sections 4 deg. dihedral. One set of "N"

THE HEINKEL H.D.43.—A high-performance single-seat fighter with the 500/700 h.p. B.M.W. VI engine.

type interplane struts on either side of fuselage. Flying wires from top of legs of "N" struts to front spar fitting on bottom wing, single landing wires in plane of top back and bottom front spars. Wing structure built up of two box spars of spruce with plywood webs and spruce and plywood ribs, the whole being covered with fabric. In place of internal bracing the underside of wings are completely covered with plywood between the spars. Ailerons on all four wings.

FUSELAGE.—Rectangular welded steel tube structure covered with aluminium cowling forward and fabric aft.

TAIL UNIT.—Normal monoplane type. Welded steel-tube framework covered with fabric. All surfaces unbalanced. Adjustable tail-plane. Fin can be adjusted on ground.

UNDERCARRIAGE.—Cross axle Vee type. Front legs of side Vees sprung with either oleo-pneumatic or rubber shock-absorber units. Axle divided and centre point braced in transverse plane of front legs of side Vees with steel tube Vee. Rubber-sprung tail-skid.

POWER-PLANT.—One 500/700 h.p. B.M.W.-VI. twelve-cylinder water-cooled engine on detachable steel-tube mounting. Radiator under engine in tunnel with controllable shutters. Main fuel tank of 310 litres (68 gals.) capacity and oil tank of 25 litres (5½ gals.) capacity in fuselage behind fireproof bulkhead. Gravity fuel tank of 80 litres (17½ gals.) capacity in root of right upper wing.

ACCOMMODATION.—Pilot's cockpit behind centre-section. Adustable seat. Oxygen apparatus.

DIMENSIONS.—Span (top) 10 m. (32.8 ft.), Span (bottom) 8 m. (26.2 ft.), Length 7.1 m. (23.3 ft.), Height 3.3 m. (10.8 ft.), Wing Area 26.56 sq. m. (286 sq. ft.).

WEIGHTS AND LOADINGS.—Weight empty 1,280 kgs. (2,820 lb.), Disposable load 420 kgs. (926 lb.), Weight loaded 1,700 kgs. (3,746 lb.), Wing loading 64 kgs./sq. m. (13.1 lb./sq. ft.), Power loading 3.4 kgs./h.p. (7.6 lb./h.p.).

PERFORMANCE.—Speed max. 322 km.p.h. (200 m.p.h.), speed at normal performance of engine 290 km.p.h. (180 m.p.h.), Landing speed 95 km.p.h. (59 m.p.h.), Climb to 3,000 m. (9,840 ft.) 4.9 mins., Climb to 5,000 m. (16,400 ft.) 9.4 mins., Service ceiling 8,400 m. (27,600 ft.).

[NOTE.—The above performance figures, which are above the maker's guaranteed figures, have been obtained and certified by the Deutsche Versuchsanstalt für Luftfahrt.]

CRUISING SPEED.

A correspondent writing in the Aug. 3 number of *Aviation*, the oldest American Aeronautical Magazine, raises the query as to what is meant by the term "cruising speed." He suggests that the term "cruising speed" should only be given when the corresponding revs. or power are available.

Aviation says that it is inclined to agree with its correspondent and suggests that cruising speed should be that obtained with the engine running at 85 per cent. of its maximum rated r.p.m.

In this country there appears to be no trouble over the definition at all. "Cruising speed" is supposed to be that obtained when the engine is running at its most economical power-weight ratio. But in practice it means the speed which just happens when the pilot pulls the throttle-lever back a bit so that the engine feels to be running well within its power. So nobody cares whether the engine is doing 70% or 80% or 90% of its power or its revs. or its consumption.

THE HEINKEL H.D.43.—A side view of the machine showing its very compact appearance.

THE DEVELOPMENT OF SPARKING PLUGS FOR AIRCRAFT ENGINES.

There are many different designs to which sparking plugs can be made, but there is interest in noting that the design which has proved generally most successful for modern aircraft engines is similar to the very earliest type of mica-insulated sparking plugs.

Briefly, the design consists of a central electrode wrapped with sheet mica, and with mica washers then threaded over the wrapping. The central electrode is formed with a head at one end and with a nut at the other end, and the mica washers are clamped firmly between the head and the nut. This insulated electrode, or centre, as it is called, is fixed into the metal body of the plug by means of a screwed gland nut, the latter bearing on a shoulder formed out of the mica washers, or by a metal washer supported between the mica washers. This construction which is shown in Fig. 1 makes the plug conveniently dismountable for inspection and cleaning.

This design is probably the best mechanically, but with the increased efficiency of engines it has suffered from certain defects. To make the plug gastight the mica washers must be clamped under very great pressure, and the great tension which the centre-pin has to withstand necessitates its being made of steel, including the head at the sparking end which is exposed to the flame of the explosions. This steel head has been found to burn and scale under the heat.

Another trouble arising from the great heat was the difference in expansion of the steel centre-pin and the mica washers, which allowed gas to leak through the plug.

In Lodge aero plugs these troubles are overcome by using a non-scaling alloy of steel which has great tensile strength. And the permanent gas-tightness of the plug is ensured by shrinking the steel collar (in the middle of the insulated centre) under great pressure directly onto the mica wrapping. In this way a gastight seal is formed, which is not affected by any variations due to expansion and contraction. This construction is shown in Fig. 2. It is classified as the Lodge A20 plug.

This A20 plug is found to be quite suitable for aircraft engines of medium compression, but when used in high-compression engines at full load it is liable to over-heat and so cause pre-ignition. To make a plug of this design suitable for high-compression engines it was necessary to find a method of improving the heat factor of the sparking plug and this without detracting from its ability to withstand oil and soot. Any design of sparking plug can be made to withstand greater heat by simply reducing the internal air spaces of the plug, but this plan reduces its oil-resisting qualities.

Fig. I. **Fig. III.**

On the left an early design of mica insulated sparking plug. On the right, the Lodge A30 plug showing the patented heat-conducting copper sleeve between the mica and the steel alloy centre-pin.

Fig. IV. **Fig. II.**

On the left the Lodge A40 plug in section and on the right the Lodge A20 plug.

When a sparking plug is fitted into a cylinder the inside part of the plug which is exposed to the flame acts as a heat-receiver, while the part of the sparking plug outside the cylinder acts as a heat radiator. The inside part of the plug may be assumed to reach the mean temperature of the combustion chamber,—less the rate at which heat is transferred from the inside of the plug to the air outside.

To improve the heat qualities of a plug without reducing its oil-resisting properties it is necessary to increase the heat conduction through the plug. The obvious way to do this is by the use of copper, but the difficulty is to introduce enough copper without materially reducing the insulation or the strength of the steel centre pin.

A number of different methods were tried, among others that of fitting a thin copper sleeve between the centre pin and the mica insulation. This method was found to make a surprising improvement. The reason for the improvement is first of all that the high conductivity copper used is roughly 30 times as good a heat conductor as the steel alloy used for the centre pin. Another reason is that in sparking plugs like the Lodge A20 it is probable that it is the mica insulation and not the central sparking point which first of all gets hot enough to cause self-ignition and the important improvement produced by the copper sleeve is probably due to its keeping the mica insulation cool.

The construction of such an insulated centre, which is shown in section in Fig. 3, is patented. The sparking plug made to this design is classified as Lodge A30. Such plugs have proved suitable for practically all modern high-compression aircraft engines.

With certain engines of exceptionally high output, such as the Rolls-Royce "F" type, it was found that even the Lodge A30 was not quite capable of withstanding the great heat at full load tests, and it was necessary to make the plug capable of withstanding still greater heat. This was effected by inserting a short copper core into the centre pin at the sparking end.

This method of construction adds considerably to the cost of making the plug, but the combined effect of the copper core and the copper sleeve is to render the plug exceptionally good in withstanding very great heat. And it still has good qualities in withstanding soot and oil. The construction of such a plug is illustrated in section in Fig. 4. This design is classified as the Lodge A40.

Although the A30 and A40 plugs have a little greater internal insulating surface than the A20, yet they lose a little in soot-resisting qualities the centres keep cooler.

Taking the figure 10 as representing both the oil and heat factors of the A20, then the comparative figures for the three plugs are as follows:—

	Oil.	Heat.
A20	10	10
A30	9	15
A40	8	17

THE LIGHT AEROPLANE AND THE FLYING CLUBS.

LEWIS REDELE.

All those who have had the pleasure of meeting our visitors from Holland at Lympne at the Easter Meeting, or who enjoyed the hospitality of the Rotterdam Aero Club in July, will learn with deep regret of the death of Mr. Lewis Redele, who was one of our visitors.

At Rotterdam Mr. Redele was flying one of the new Pander machines with great skill. He was a prominent and energetic member of the Rotterdam Club, and was very popular among the aeronautical community in the Netherlands.

According to *The Times* of Aug. 24 Mr. Redele was killed on the Bolzano Aerodrome in Italy.

THE CANADIAN LIGHT AEROPLANE CLUBS.

The Canadian Government is spending $140,000 (£28,000) this year on matters directly concerned with the Canadian Flying Clubs . Five new clubs have completed their organisation this year and are already in operation. These clubs, which have received their Government aircraft on loan under the subsidy arrangement, are: Kingston, Fort William, St. Catherines, St. John, N.B., and Sydney, N.S.

Five more clubs have claimed Government aeroplanes, but only three of these will be equipped, as the appropriation for this year will then be exhausted. These three clubs are: Brandon, Man., Stratford, and Brantford, Ont.

During 1928 sixteen new clubs were equipped with Government-loaned aircraft, making a total of twenty-one clubs in operation up to the end of the year.

FROM SINGAPORE.

The Club is going on very well. The only drawback is that the sea is not always sufficiently calm when the weather is otherwise excellent for flying. By dint of plenty of work and exercise of care, the machines have all been kept serviceable during the last two months. Keenness on flying is not confined to members of the Club alone. One has met several people who would readily avail themselves of the opportunity and advantages of air transport to such places as Penang, Batavia, Java, etc.

It is interesting to note that according to the *Singapore Free Press*, the Dutch have made, and are making, great strides in commercial aviation. One wonders why the Dutch (with all due respect to that go-ahead little nation) should be the first people to fly commercially, as it were, from Singapore.

Perhaps the Powers-that-be, and Big Business have adapted a ca'canny see-how-he-gets-on-first policy. However, one watches the march of Progress of British aviation with hope—and optimism.

One is sending this letter by the old and tried method of sea-mail. One would naturally prefer to send it by air, but if we run air mails, with true British modesty, we don't tell the world. At any rate, the Post Office officials could give one no definite information about air mail services to the United Kingdom.

[The England—India Air Mail Service is useless for any point outside India. Letters sent to Singapore by Air Mail arrive, as a rule, slightly after those sent by boat, owing to the slowness of mail communication between India and the Malay States.—C. G. G.]

THE MONTREAL LIGHT AEROPLANE CLUB.

The month of July was marred by the tragic accident to the Club's Chief Instructor, Mr. A. E. Golds, and a member, Mr. C. H. Dowd. The actual cause of the accident cannot be definitely established because no one with any knowledge of flying saw it and the subsequent fire prevented any examination of the wreck. In Mr. Golds the Club has lost a brilliant and very popular instructor and in Mr. Dowd an enthusiastic member and a promising pilot. As a result of the accident the Directors have passed a bye-law which prohibits any aerobatics in the Club's machines except when authorised by them in writing or for the teaching of spins and stalled turns.

Capt. H. Spooner, the Assistant Instructor has taken over the duties of Chief Instructor and no other instructor will be appointed at the moment.

The flying time for July was approximately 125 hours made up of 65 hours dual, 35 hours solo, 5 hours passenger carrying and 20 hours test flights, air meetings, races, etc.

The amount of flying done by the large number of soloists is still disappointing. If they feel that, having learned to fly, they having nothing further to learn as pilots, the Instructor undertakes to remove the illusion in five minutes.

Four Club machines attended the Granby Flying Meeting on Dominion Day. Mr. Golds gave a display of aerobatics and was second in the open handicap race. Mr. Lytell won the open landing competition.

FAR EAST.—A D.H. Moth (Cirrus Mark III) of the Singapore Flying Club. In the cockpit is Flt. Lt. D. V. Carnegie, A.F.C., No. 205 (Flying Boat) Sqdn., R.A.F., who has acted as honorary instructor to the Club.

Digitized by Google

THE FIRST LIGHT AEROPLANE ON THE SCILLIES.—Colonel Sempill and some of the Indigenes.

Capt. Spooner flew to Moncton for the Moncton Meeting, stopping at Quebec and Rimouski on the way. He was second in the handicap race and in the bombing competition. He made the return journey *via* Woodstock, Caribou and Quebec with head winds in 8 hours' flying time.

The monthly lunches and the weekly cross-country flights started this month. All four Club machines went on the first cross-country, which was to Granby. The second cross-country was to Quebec but only enough members for two machines were able to go.

The Rumble Club is going strong,—as several members and the instructor have found out to their cost.

Visiting aeroplanes during July included two Lockheed Vegas, two three-engined Fokkers, a Cessna monoplane and the Transcontinental Record-Breaker flown by Capt. Hawks.

Two members have just returned from a sixteen-days seaplane holiday. This is believed to be the first trip of its kind undertaken in Canada. They covered 2,500 miles through the Maritimes and found no difficulty in locating good landing places. The pilot, Mr. Cushing, warns other pilots of the danger of flying low over rivers on account of the possibility of high-tension wires which are suspended without any warning signs. The itinerary was:—

Quebec—Lake St. Agnes (back of Murray Bay)—Over Riviere de Loup to Cabano—Temiscouata—Fredericton—St. John (Milledgeville)—Charlottetown—Scotsville (Lake Ainslie)—over River Margaree to Whyocomagh—Sydney—St. Peter's Passage—Guysborough—Country Harbour—Halifax—Bay of Fundy—St. John—St. Andrews—Bar Harbour (Mount Desert Island on Eagle Lake)—Rockland—Prout's Neck—Lake Winnepesaukee—over the mountains to Windsor (Vermont)—Champlain—St. John—Dorval Island—Montreal.

ANOTHER LIGHT AEROPLANE RECORD.

Herr Edzard, flying a Focke-Wulf biplane, has broken the world's record for distance covered over a closed circuit in the 1st Light Aeroplane Category (two-seater aircraft weighing under 400 kgs. (880 lbs.)), by covering a distance of 1,601.2 kms. (approximately 995 miles) in 13¾ hours.

The previous record was held by Comm. J. Hermansky and Lieut. Machacek (of the Czechoslovak Army), who on July 11, 1928, covered a distance of 1,500 kms. (approximately 900 miles) in an Avia BH9 (60 h.p. Walter).

A GOOD DAY'S WORK.

Mr. Lief Lier, the well-known Norwegian pilot, who is taking out a Gipsy-Moth in the Norwegian whaler *s.s. Kosmos*, which is shortly sailing for the Antarctic, did a good flight the other day. He took delivery of the machine at Stag Lane and, flying by way of Ostende, Amsterdam, Hamburg and Copenhagen, reached Oslo in Norway the same day,—about 975 miles in 8 hrs. 55 mins.' flying.

GLIDER TOW-RING.

A home-made glider, piloted by its designer and builder, Mr. Wallace Franklin, has been towed from Ypsilanti, Mich., to Akron, Ohio, a distance of 170 miles, by Mr. Hugh Robbins flying a Waco biplane.

The two craft were interconnected by a cable 300 feet long which could be disconnected by a quick release ring by the pilot either of the glider or of the aeroplane.

When at a height of 500 feet over Akron the glider was released and it glided down and made a perfect landing.

The flight lasted for about 3 hours.

CIRRUS ENGINES IN THE U.S.A.

The New Standard Aircraft Corporation, of Paterson, N.J., has ordered 50 Cirrus III. engines from American Cirrus Engines, Inc., of Belleville, N.J., for use in a light training machine which is to be produced shortly.

THE FIRST LIGHT AEROPLANE ON THE SCILLIES.—Colonel the Master of Sempill and the Hon. Mrs. Forbes-Sempill recently flew to the Scillies in a Gipsy-Moth—a matter of 30 miles over-sea flying—which is not right, in a light aeroplane. However, they have the distinction of being the first to land on the Scillies,—since a D.H.6 landed there during the War 1914-18, in preference to going into the ditch. In this picture St. Mary's, with the capital, Hugh Town, is seen in the middle distance, with the Golf Course in the foreground.

A FRENCH LIGHT AEROPLANE.—An Albert cantilever monoplane (Armstrong Siddeley Genet engine) of the type on which M. Albert recently beat the French Light Aeroplane Height Record.

THE ORLY FIASCO.

The official results of the *Challenge Internationale de Tourisme* have been issued by the *Aéro Club de France*.

Morzik, flying a B.F.W. with a Siemens engine, was placed first. Broad came second; Lord Carbery third; and Miss Spooner tenth. The intervening places were pretty well shared out; no one country doing outstandingly well.

The final placings seem to have been largely determined by speed and practical quality. All the competitors, with one exception in each case, received the same points for regularity and changing of parts.

Practical quality varied from 32.50 gained by a Klemm and an Antilopa down to 12 points obtained by the Raab-Katzenstein belonging to Lord Carbery.

In practical quality the Germans had the honours in the main; with the Romeos running them very closely. In speed Morzik, the winner, and Carbery led with 70 marks. Down at the tail was a Breda with only 3.5. From 70 km. there was a big drop to 60 for Broad and 57.50 for Dungern—two B.F.W.s in the first four; then 5 Italian planes and Miss Spooner all 50 mks. and over.

There is a tremendous range of speed shown in the competition as was only to be expected, and this has enormously influenced the placing of planes otherwise fairly equal. A comparative study of these results will give food for thought to experts in the construction and design.

Unfortunately we are all still in the dark as to how marks have been allocated for speed round the course.

This is a sketchy analysis of the results to date. How many of them will stand remains to be seen.

Orly Figures.

Herewith are the final markings as issued by the *Aéro Club de France*. The first letter gives the competition marking of the machine, then comes the make, the engine and the pilot. The first figure thereafter represents the marks for speed over the course, then the marks for regularity, then for non-changing of parts, then those allotted for "practical qualities" before the start, and the total.

A4, B.F.W. M.23B, Siemens 70, Morzik, 70 mks., 35 mks., 14, 19.50, 138.50.

F6, Potez 36, Salmson 95, Finat, 23.75 mks., 35 mks., 14, 18.75, 91.50.
B9, Albatros, Siemens 70, Junck, 15.75 mks., 35 mks., 14, 25.25, 90.
E7, Caudron, Salmson 95, Delmotte, 23.75 mks., 35 mks., 14, 12.75, 85.50.
A5, B.F.W., Genet 80, Croneiss, 15.25 mks., 35 mks., 13, 21.75, 85.
M6, Breda 15, Cirrus, Liberratti, 3.5 mks., 35 mks., 14, 24.75, 76.75.
H2, St. Hubert, Walter 85, Maus, 10.30 mks., 30 mks., 14, 18.125 72.625.
K5, Eliminated.

Here may be noted the fact that the Moth which Lady Bailey flew round the course—out of the competition—has a Cirrus III engine.

Reflections by an Outsider.

So the Grand Tour is finished; the results are out and a German has won. But England, or rather Englishmen, take second and third places; and Miss Spooner, the only woman in the tour, magnificently is tenth on the list. And to crown our justifiable triumphs we are disqualified.—Or rather in great danger of so being.

It looks very much as if these splendid efforts are to be annulled—and that is not pessimistic either. "An inquest is being held"—"inquest" is well the word—to decide whether these British results shall be accepted; the results of which inquest "may produce great changes in the classification." So says the *Aéro Club de France*.

Broad, Lord Carbery, and Miss Spooner have been convoqued for this inquiry, which will take place next week. And in the meantime we are left speculating as to where the final honour of being considered first will really fall.

There are certain regions of military significance scattered all over Europe above which flying is not permitted and to avoid such of these tabooed regions as were encountered on the course, a certain annoying détour was necessary. It now appears that Lord Carbery, Broad and Miss Spooner did not make the necessary détours; and for this they may be disqualified.

Now, either they knew about the forbidden areas or did not. If they did, and still disregarded the regulations they deserve all they get and one can only regret that England's flying reputation was temporarily in their keeping. I have neither seen them nor communicated with them so do not know the facts, but I cannot help thinking it rather strange that Germany, France, Italy, Jugo-Slavia could all avoid these places and only England trepass.

But let us assume they did not know—and this seems the more likely assumption. Then one asks one's self they did not know? And there is only one answer to They were not properly looked after.

They came alone, Miss Spooner with a mechanic Broad with his mechanic, to a strange country, possibly not knowing the language fluently; they had none to meet them, none to help them—officially they received no help at all. England was either too poor or too economical to enter them through the Royal Aero Club, but they were sufficient sports and sufficiently anxious to proclaim the merits of their machines to do it off their own bats.—And incidentally, weren't they justified?

England, the greatest light-'plane producing country the world, had two representatives in an international competition, both entering privately, and even then could not give them proper assistance or even look after them at the start. And this is the result: a mistake which could so easily have been avoided has created all this confusion. It is enough to discourage anyone. Such a state of apathy could only exist in England. We may indeed congratulate ourselves.—V. G. W.

[All of which is very true and very sad. What one can gather from private gossip is that all the faster and more powerful machines,—including all the Italians,—flew over the prohibited area quite deliberately, trusting to getting so high that nobody would recognise them. Anyhow all the fuss about these Alpine areas is sheer nonsense,—and is part and parcel of that new Italianism which imprisons touring schoolmasters without trial and fines one for putting clean shoes on the dirty seats of railway-carriages.—C. G. G.]

HEIGHT RECORDS.

An Albert monoplane (Armstrong Siddeley Genet engine), piloted by M. Albert, has broken the French height record for light aircraft weighing less than 400 kgs. (880 lbs.) by reaching a height of 6,540 m. (21,255 ft.), which was 1,005 m. (3,276 ft.) less than the previous French record and only 192 m. (624 ft.) lower than the World's record.

Since this a Beazley NB-3 monoplane (Armstrong Siddeley Genet engine) has broken the World's Height Record for aircraft in this class by reaching a height of 25,000 ft.

L'ESCADRILLE LAFAYETTE.

[*One Man's War*, by Bert Hall and J. J. Niles, with an introduction by Elliott White Springs. 352 pages, 9in. by 5½in., eight drawings (four in colour), 15 photographs. John Hamilton, Ltd. Supplied by The Aeroplane Book Dept., Cannon House, Pilgrim Street, E.C.4. 15s. net.]

This book is composed of extracts from the dairy of an American who served with the French Army during the War 1914-18. The diary is supplemented by the personal reminiscences of the diarist. What part of the book is the work of the co-author, J. J. Niles, the publishers do not disclose. The book is illustrated with eight drawings, four of them in colour, by Mr. Leonard Bridgman, and a number of photographs. The drawings describe air combats and the photographs are of people discussed in the text.

Lieutenant Bert Hall taught himself to fly in 1910 on a Maurice Farman biplane at Buc, near Versailles. His description of aviation in those days will amuse those who have personal recollections of it, and will be an education to those who are nursed into the air in these days. Certain similarities still exist. He wrote:—

> Cockiness is not a good characteristic in a pilot's make-up. Pilots often die of it, only the newspapers report it under different names.

In 1913, during the Balkan War, he hired himself, his mechanic, and his new 60 h.p. Gnôme Bleriot monoplane to the Sultan of Turkey for an Air Service for 100 American dollars a day, but being dissatisfied with the unreliability of the Turkish exchequer, he flew over into Bulgaria and worked for them at the same rate of pay. He tried to return to the Turks, but was arrested and condemned to death. However, his mechanic raised enough money to buy him out. For some months after that he made a good living by giving exhibition flights in Bulgaria. Of those days he wrote:—

> My little sixty-horse-power Gnome motor never missed a lick all that summer. Those early rotary motors were suberb pieces of mechanism.

On the outbreak of War he joined the American Volunteer Corps formed in Paris. Although 150 trained for a fortnight, only half that number took the oath of allegiance at the end of their training. The faithful few, and other Americans who joined them later, were used to make good the gaps in the ranks of the Foreign Legion caused by the German, Austrian and Turkish members of the Legion who were left in Morocco when the Regiment went to France. The author's description of life in the trenches near Reims with the Legion during the last months of 1914 gives an impression of sincerity and truth.

In January, 1915, the author and two other Americans who had served in the Legion with him were transferred to the French Flying Corps and posted to the training centre at Buc. Here they discovered the wisdom of good fundamental flying training before going to the front. Eventually they joined a squadron near Chalons and flew Morane-Saulniers.

Here they met Garros, Brocard and Guynemer, and first saw the original interrupter gear invented by Garros for firing through the propellor by deflecting the bullets, known as the Système Alçon. Shortly afterwards Garros was captured, invention and all.

The book describes the early reconnaissances when steel darts were the only weapon against ground forces. Of those days he writes:—

> When I think of the wonderful pilots who went out, day after day, and never came back—some of the most marvellous pilots in all the world and men from the very first families—I realise that a lot of the civilian flying nowadays that gets into the daily news sheets is all forced draught, to say nothing of being ancient history.

There are brief romantic interludes, but most of the book describes fighting in the air, the excitement over new types of aircraft, the capture of the first enemy aeroplane by the Squadron, and the effect of war news on the members of the Squadron. One philosophical statement runs:—

> Talking-up one's exploits had its advantage even in a big-calibre war.

A great deal of the work of this Squadron consisted of Special Missions, or dropping spies over the lines.

The Lafayette Escadrille, a Squadron of Americans in the French Army, was formed in the spring of 1916. A mass of fiction has grown up about this Squadron, but the true story of its origin and early days is given in this book. Practically all the Americans serving with the French Air Service joined the Lafayette Squadron, but at first there were only seven pilots, of whom Lieut. Hall was one.

Most of the book deals with the work of this amazing unit during the six months that the author served with it. In September, 1916, he went back to his old Squadron of the French Flying Corps, but he did not lose touch with the Escadrille Lafayette.

The description of the period in which the Squadron shared the aerodrome at Luxeuil-les-Bains with the R.N.A.S. and took part with them in the bombing raid on the Mauser Works at Obendorf, is particularly vivid and interesting, but one wonders how much reliance can be placed on the story of the R.N.A.S. formation which set out to bomb Mulhouse and very nearly bombed Basle.

In January, 1917, the author was sent, by the French War Office, on a special mission to Russia. This part of the book reads more like fiction than fact, although it may well be that he found it harder to describe the outbreak of the Revolution, of which he was an eye-witness, than the simple incidents of his daily life.

Nevertheless, he was awarded the Cross of St. George and the Medal of St. Vladimir by the Tsar and the St. Stanislus Medal and the Vertu Militaire by the King of Roumania. His impressions of the state of the armies and populations of these countries are forcibly expressed.

He escaped with difficulty, and adventured from Russia through Valdivostock and Harbin to Shanghai and Yokohama, where he got a boat to San Francisco.

The rest of the book bears the stamp of disillusion and exhaustion. Disgusted with his countrymen's attitude towards the War, which they had just entered, he returns to his Squadron in France, to find many friends gone and tremendous changes. He is given counter-espionage work to do, and sees a younger generation on new machines fighting in the air. Quite at the end he is heartened by the way the American forces distinguished themselves.

Lieutenant Hall's book will be compared with *War Birds, the Diary of an Unknown Aviator*, and to a certain extent there is a likeness. But this book has not Grider's unstudied lightness of touch. It is heavier, more middle-aged, and more cosmopolitan.—C. M. MCA.

AN EDUCATIVE INFLUENCE.

One of the handsomest publications yet produced in connection with aviation is the "Book of the Moth" which the De Havilland Company had on sale at the Aero Show. Primarily it is, quite naturally, an advertisement for the Moth. But it is in fact very much more than that. It is a beautifully produced publication which if placed in the hands of anybody who is not at the moment interested in flying should go a very long way towards making them so.

Apart from telling people why they should fly, it is bound to give them confidence in flying. And the two pages of views of well-known places under the heading "A Moth's Eye View" are enough to make anybody want to fly.

Not content with technical arguments and ocular temptation, the book gives sound financial reasons for flying as a sport. Also it tells all about how the Moth and its engine are made, and how people learn to fly. The printing is beautiful. The price is 1s. 6d. and it is well worth it.

The Importance of Air Navigators

Those who wish to study Air Navigation are recommended to buy the following books:—

PRINCIPLES AND PRACTICE OF AIR NAVIGATION. Lieut. J. E. Dumbleton.	12/6
PRIMER OF AIR NAVIGATION. H. E. Wimperis, M.A.	8/6
AIR NAVIGATION (CONSOLIDATION) ORDER, 1923.	1/-
MANUAL OF AIR PILOTAGE.	2/-
ELEMENTARY METEOROLOGY. W. H. Pick.	1/6
AIR NAVIGATION, Notes and Examples. S. F. Carol.	10/6
DIRECTION AND POSITION FINDING BY WIRELESS. R. Keen.	9/-
AIR NAVIGATION AND METEOROLOGY. R. Duncan.	15/-
PARTICULARS OF METEOROLOGICAL REPORTS issued by Wireless Telegraphy in Great Britain, etc., 1929.	5/-
THE AIR PILOT'S MAP OF GREAT BRITAIN, 64in. by 40in.	10/6
INTERNATIONAL GENERAL AERONAUTICAL MAP (Britain).	4/-

A SOURCE OF ACCURACY.

On the bank of the River at Teddington, just below the weir, there used to be a cement store. One winter day there was a flood which, when it receded, left a layer of solidified cement bags right over the floor. More cement was spread over these bags to level off the floor, with the result that now there is a concrete base three feet thick.

On this solid foundation and far from any traffic-shaken roadway are built the works of the Accurate Recording Instrument Co. Ltd., where all the delicate instruments necessary to the functioning of an aeroplane are constructed, such as air-speed indicators, altimeters, pressure gauges, thermometers, cross-levels, and more besides, such as revolution indicators.

This firm is now being placed on the approved list of the Air Ministry, but Mr. Norman Reid, the firm's managing director, rather regrets the passing of the old régime, whereby all instruments went to Kidbrooke for Air Ministry testing. He was glad to have an independent check on the accuracy of his instruments.

Careful analyses made from the inspection reports show that the total rejection figure for all instruments submitted is under 10 per cent. This phenomenally low figure includes both new and re-conditioned instruments.

An interesting sidelight on the value of the Aero-Show is the number of inquiries which have been received by the company from firms on the Continent, and especially in Central Europe, who are anxious to secure the agency for these instruments. Visitors to the Aero Show noticed the Accurate Recording Instrument Co.'s products on various stands and are now sending in their inquiries.

The most enlightened ideas on works' management prevail at the A.R.I.C. works. The employees are all paid in excess of Trade Union rates and by the week. Like all salaried staffs they are paid during holidays and when on sick leave.

In addition there is a simple bonus scheme. Ten per cent. of the net profits certified by the firm's accountants are set aside for division among the staff. Each member receives the same percentage of the bonus as they do of the total wages bill. "*Unto him that hath, shall be given!*"

All of which makes for a happy ship. In spite of the lack of such inducements as a piecework scheme to boost production, a big output is kept up, together with the extremely fine record for accurate workmanship, exemplified by the low percentage of Air Ministry rejections.

Up in the offices are a representative collection of the firm's products, which range from common or bathroom thermometers, commercial pressure-gauges, recording pyrometers, instruments for recording water-levels in distant reservoirs, and instruments for dairy purposes, to the aircraft instruments previously mentioned.

A tour through the works illustrated the value of the solid concrete floor. When one was in the machine-shop, although the machinery was running, no vibration was noticeable In this shop is the usual range of equipment, though of the light type, specially suited for instrument work. One watched a man busily engraving dials for air-speed indicators and cutting the figures exactly twelve "thous." deep. The firm do all their own enamelling and one was shown the up-to-date plant where this is done.

The *sanctum sanctorum* is a small enclosed space where the vapour-tension thermometers are filled. This process is secret, and only three persons in the A.R.I.C. works know it. One other firm only in this country knows the process.

One saw the smallest hole drilled in brass that one has ever seen, which was only two-thousandths of an inch in diameter, and so nearly imperceptible that only the evidence of a specially ground piece of wire pushed through it convinced one of the hole's "holiness." The man who drilled the hole and made the drill to do it has been at the trade thirty-five years and is an expert on altimeters. He delights in repairing the fine chain used in these instruments, the pins and links are so tiny that an ordinary person fails to distinguish them.

Revolution indicators are marked-off by means of a Stroboscope, a devilish instrument guaranteed to produce D.T.'s after a dry ginger.

The ingredients of the apparatus are a tuning-fork, a neon light and a revolving disc with funny patterns. On the word "Go!" the disc is started up and the neon light is switched on. The tuning-fork, which is electrically vibrated, acts as a make-and-break for the neon light. Thus one obtains a flickering light of known frequency. The effect of this occulting (or flickering) light on the rotating disc is to produce various patterns which appear stationary.

Each pattern appears stationary at some special rate of revolution and, as the revolution indicator is directly coupled to the motor running the disc, it is possible to mark off the dial from the setting of its pointer when the disc indicates some known speed.

One was shown various instruments on test and incidentally the effect of temperature-variation on calibration tests. An air-speed indicator was put under pressure and at once the needle registered the correct speed. By placing the hand on the back of the instrument where its warmth expanded the air inside it was possible to make the needle to register another 4 m.p.h.

Among other testing equipment is a refrigerator which will produce 52° F. of frost. It is used for testing thermometers at low temperatures. One compared the happy situation of people in this factory by the riverside with its own ice-plant, with those in Olympia during the heat-wave.

In connection with vapour-tension thermometers, which are a speciality of the firm, a device is being developed for controlling the temperature of the lubricant in internal combustion engines, whether applied to cars or aircraft. The device is simple and can be adapted to any class of engine,—which probably accounts for the interest shown in the scheme by manufacturers.

Another cunning gadget now in development at the A.R.I.C. works is one for controlling the temperature of the water in water-cooled engines. Again use is made of the vapour-tension thermometer in connection with a mechanical device which controls the water-flow through the system.—T. J.

SOMETHING ABOUT PICKLING.

[*Metal Pickling: A short treatise.* By E. E. Wynn. Published by Charles Sener Ltd., and obtainable from The Aeroplane Book Dept., Cannon House, Pilgrim Street, E.C.4, at 2s. 6d.]

Pickling, which is the expression usually applied to the method of cleaning metal surfaces by immersion in some acid solution, has been rather ignored. One does not see much published about this subject, and for this reason one is glad to have read an excellent little treatise by Mr. E. E. Wynn.

This small book is written clearly and in a simple non-technical fashion so that anybody interested may easily understand the writer. It is well worth the attention of all who are connected with the problem of pickling material in aircraft works, especially as pickling offers an alternative to sand-blasting.

In the introduction the book states quite definitely that although ferrous and non-ferrous metals are treated by various processes of pickling, the book will confine itself to the treatment of Iron and Steels.

When iron or steel is heated and allowed to cool in the atmosphere or in the presence of oxygen, a scale of oxide is formed. Such a scale must be removed before the metal can be cold-rolled, cold-drawn or put through other manufacturing processes.

The object of pickling is to remove this scale. The scale is really forced away from the metal by the evolution of hydrogen gas, which results from the attack on the metal by the acid. The scale being porous allows the acid to reach the metal beneath.

Apart from pickling sand-castings or stainless steels which call for special acids and special treatment, sulphuric or hydrochloric acids are generally used. The former is popularly known as vitriol and the latter as muriatic acid. Vitriol is used hot and muriatic acid cold.

In the portion headed *Wires and Tubes*, the author emphasises the importance of a good drying oven, this not only dries the work but helps to drive out the hydrogen from the pores of the metal. The presence of this gas causes *acid brittleness* which results in overheating and the cutting of dies. When tubes are being pickled they should frequently be moved so that the used acid inside them may be replaced by fresh.

Sections devoted to *sheet pickling* for tinplate and galvanising discuss the troubles generally met with in these processes and discusses means for overcoming them.

If sand castings are going to be cleaned by pickling, hydrofluoric acid must be used, as silica, which is the chief constituent of sand, is indissoluble in either sulphuric or hydrochloric acids.

Stainless steels call for individual treatment. Generally speaking two baths must be used, one containing hot sulphuric acid and the other a 15 to 20 per cent. solution of cold nitric acid. In extreme cases a treatment of caustic soda after the usual pickling may prove advantageous.

Substances known as *Inhibitors* are now on the market and have the advantage of limiting the action of the acid to the removal of scale alone. They also have the advantage of restricting the formation of the unpleasant fumes which arise from the use of hydrochloric acid.

The book closes with a summary of equipment and deals with the question of tanks. The writer only mentions tanks built of stone slabs or of wood. The latter are internally lined with a special pitch or lead. No reference is made to tanks of non-corrosive metal. One feels that gentlemen prefer pitch-lined wood tanks.—T. J.

COMMERCIAL AERONAUTICS.

HIGH-SPEED MAIL-CARRYING.

On Monday, Aug. 25, an experimental flight was made between Galway, London and Berlin with mails from the North German Lloyd *Karlsruhe*. The ship *en route* from New York to Cherbourg landed mails for London and Berlin at Galway. These were taken to Oranmore Aerodrome where a Vickers Vixen (Rolls-Royce F) was waiting.

The pilots, Col. Charles Russell (late of the Irish Free State Air Force) and Mr. J. Summers of Vickers Ltd., started for Croydon in thick weather at 07.30 hrs. After stops at Baldonnel and Sealand they reached Croydon at 11.38 hrs.

Mr. Summers said that the speed of the machine according to the air-speed indicator was 165 m.p.h.

The mails for Berlin were transferred to a Luft Hansa machine which reached Berlin at 18.30 hrs.

Thus our Post Office was enabled to deliver mails for London 36 hours earlier than would otherwise have been possible. Whether they were so delivered is another matter. Probably they were not.

The Berlin mails were delivered 60 hours earlier than they would have been otherwise.

The Vixen after taking on mails from Berlin and London returned to Galway to meet an outward bound ship.

The flight was made on behalf of Irish Airways Ltd. and the machine was loaned by Vickers (Aviation) Ltd. Irish Airways Ltd. has been formed to study the question of running such a service from Galway to London.

The outstanding incident of the experiment is the use of a machine with a speed in excess of 150 m.p.h. for mail work. This is an indication of what air mail speeds should be.

[That such a demonstration should be given to us at the instigation of an Irishman is typical of our history. Ireland does these things and then forgets them while it lapses into barbarism. Ireland had the first electric railway (Portrush) and the first electrically-lighted town (Carlow) in the British Empire, and probably in Europe, and was about the last country in the World to use electric power, light or telephones as a habit. Probably we shall be flying a 150 m.p.h. air mail to Australia before Ireland has a regular commercial air service.—C. G. G.]

THE I.A.T.A. AT THE HAGUE.

The 22nd session of the International Air Traffic Association opened at The Hague on Aug. 26. The occasion was the 10th anniversary of the Association's formation.

All the European Air Lines were represented. The British Director of Civil Aviation, Sir Sefton Brancker, was with the contingent from this country.

AIR TRANSPORT IN THE WEST INDIES.

Negotiations are at last proceeding for the establishment of an all-British system of air transport in the British West Indies. The question of aviation in the Caribbean area was very thoroughly explored by a committee appointed by Sir Samuel Hoare in 1926. Since then, though its findings have commended themselves in general principle to the West Indies Conference, no practical progress had been made until quite recently, as neither the Imperial nor the Colonial Governments were prepared to contribute the heavy subsidies which their adoption would have involved.

Now, however, the situation has changed, for so great has been the development of aircraft manufacture and so substantial the economies resulting from a greater output that those concerned believe that air transport services can be set up and maintained in the Caribbean area at a cost considerably below that envisaged by the Air Transport Committee.

Moreover, the attitude of the Government towards Civil Aviation has undergone a welcome change. Hitherto the Department concerned with it has suffered from the appropriation available being altogether inadequate for the encouragement of aviation in outlying parts of the Empire. This now appears to be recognised and signs of a more generous policy being adopted towards British Aviation are becoming apparent.

The Government at last realise that Great Britain, handicapped by the War, is at least three or four years behind the United States in the development of air transport,—at any rate in the New World, and especially in Central and South America, where at least three American companies are blazing the trail.

Consequently the moment is opportune for grasping the problem of air transport in the British West Indies and indeed, the statement may be made that if it is not grasped immediately, it may be too late. Therefore there is satisfaction in learning that a British Company entitled Atlantic Airways Ltd. has recently been formed to serve Western Atlantic Colonies.

The Aeroplane understands that this firm has secured the confidence and sympathy of the Air Ministry and has what is equally important the promise of substantial backing by business firms of high standing in Canada and in this country. Its ultimate aim is to provide an all-British service of seaplanes to carry passengers, freight, and mails between Canada and South America, calling at the principal West Indian islands and British Guiana on the way.

The sooner this scheme materialises the better it will be for British prestige, which must suffer in the New World unless something is done, and done soon.

The proposals of Atlantic Airways Limited fall under three headings namely:—

(a) A service based on Trinidad and operating between Port of Spain, British Guiana, Barbados and Venezuela and including internal services in British Guiana.

(b) A service between Trinidad and Jamaica by way of the Islands.

(c) A service between Jamaica and Montreal by way of the Bahamas and Bermuda.

These proposals have been referred by Lord Thomson to

A HIGH-SPEED MAIL TRIP.—Mr. Summers of Vickers Ltd. and Col. Russell (Irish Free State) arriving at Croydon from Galway with German mails, having done the journey in four hours in the Vickers Vixen (Rolls-Royce F.). The distance is only 430 miles, but there were two hospitable stopping places.

the Civil Aviation Consultative Committee which he has set up under the Chairmanship of Mr. S. Montague, Under-Secretary of State for Air, and all will hope that the result of their examination by that body may prove satisfactory.

When the State makes known how far it is prepared to support the enterprise no doubt arrangements will be made to despatch a mission to the West Indies without delay to discuss the proposals with the local Governments concerned.

AIR TRANSPORT IN THE EAST INDIES.

A Singapore report states that the results of the Royal Netherlands-Indian Air Lines have surpassed the most optimistic expectations during the first six months of this year. Passengers of every nationality and of all ages, and cargo ranging from Sarongs to radio lamps, have been carried on the regular routes. During this period (January to July, 1929), 1,093 flights were made, making 1,307 flying hours. Of these 869 were flights on the regular line and the rest were extra and demonstration flights. The total number of passengers carried was 6,577 or just over 1,000 per month.

The Company expect to open the Batavia—Sourabaya line in the near future and work in the Darmo flying field is well in hand. The Batavia—Singapore—Medan line is now in its preliminary stage, and permission has been obtained to use the Seletar flying ground in Singapore.

Intermediate emergency landing grounds on Dutch East Indian territory are now in course of construction and the Company expect to open a service between Batavia and Palembang shortly.

LINKING UP WITH PERSIA.

An inconsiderable *Reuter* paragraph stowed away in a corner in *The Times* of August 24 discloses quite a notable fact concerning air transport. The Junkers air line operating in Persia now comes through to Baghdad and is timed to connect with the England—India service of Imperial Airways. The result is that mails can now be sent to Teheran by that route with a great saving of time.

As a matter of fact the Junkers line has been coming through to Baghdad for quite a considerable time, and the Junkers personnel work most amicably with our people at Baghdad.

One slight hitch in the service, from the users' point of view, is that it cannot be used for one of the purposes for which it should be most useful, namely the carriage of commercial samples. The Junkers line is not allowed to carry as freight any parcel under 6 lbs. in weight, and is not allowed to carry as a letter anything over the letter limit of a few ounces. All packages between such limits, which would include nearly all samples, have to go by the regular Persian parcel post which is carried by car to Teheran, and takes two or three weeks over the journey which is covered by the Junkers air line in a couple of days.

A NOTE ON SEAPLANES.

A reader in the Far East who has had much to do with operating seaplanes writes as follows:—

Close acquaintance with seaplanes has convinced me that seaplanes call for special material in their construction. It is all very well for aircraft manufacturers to merely stick a pair of floats on what would otherwise be a perfectly good landplane, and to say—"Well, here you are, here is a really serviceable seaplane." But put to the acid test one soon discovers where the ordinary land plane fails in its masquerade as a good sea-worthy craft.

The salinity of sea-water, especially in this part of the globe, soon shows its effect upon the various fittings and washers, etc., which are, in many cases, made of dural or aluminium. Paint only stays the arch-enemy, Corrosion, for a time,—especially with aluminium. Like old soldiers, it never dies, simply fades away. Particularly would one advise manufacturers to refrain from putting aluminium or dural packing blocks in interplane strut ends.

One would like to add that the anodically-treated dural floats resist corrosion admirably, provided, always, of course, that they are carefully washed with fresh water after each sea-water immersion.

Given fair conditions, the life of a land-plane can be very long, but replace the undercarriage with floats, make no other modifications, send your poor little landplane to sea, and he (or she) deteriorates much quicker than under his (or her) natural conditions.

THE WAR IN THE AIR.

On Aug. 24, two mail-carrying seaplanes alighted in New York. One had been catapulted from the French liner *Ile de France* and one from the German liner *Bremen*.

The French aeroplane took off at the Ambrose lightship, when the liner was 30 miles out. The German, a Heinkel monoplane, was launched 200 miles from shore. The result was that the mail from each machine had been distributed long before the liner had docked.

The *Bremen* is a new-comer in this game, as the *Ile de France* made successful—and unsuccessful—trials in catapulting mail-carriers in August, 1928.

The *Ile de France* on the return voyage launched by a catapult a mail-carrying seaplane on Aug. 26 when the liner was off the Scilly Isles. The machine alighted safely at Le Havre. The mail was distributed in Paris the following day, that is to say, 24 hours earlier than it would have been by the normal delivery. The machine used was a C.A.M.S. flying-boat with a Lorraine-Dietrich motor.

THE CANADIAN TRANS-CONTINENTAL MAIL.

Great Western Airways, Ltd., of Calgary, Commercial Airways, Ltd., of Edmonton, and Commercial Airways, Ltd., of Regina, have united to make a bid for the Trans-Canada air mail contract.

The new organisation will be known as Great Western Airways, but the companies forming the organisation will not lose their identity as far as private commercial works are concerned. The facilities of each would be available for carrying mails, but they would continue their own individual businesses.

The organisation will be under the management of Sq. Ldr. Tudhope, R.C.A.F., who is at present Supervisor of Airports and Airways for the Dominion Government.

Mr. H. A. Oaks, who was original organiser and managing director of Western Canada Airways, and is at present managing director of Northern Aerial Minerals Exploration, Ltd., a $5,000,000 aeroplane exploration company operating in Northern Canada, is on the provisional Board of Directors, which includes representatives of the three companies concerned. Arrangements have been made to finance the Dominion mail contract to the extent of $1,000,000 if it is awarded to the company.

AN AIR UNION NOTE.

On and from Sept. 1 the afternoon "Golden Ray" service at 17.30 hrs. to and from Paris will be cancelled.

AN AMERICAN VISITOR.

Mr. John A. Love, Chairman of Allied Aviation Industries, Inc., of St. Louis, Mo., is due in London at the end of this week with a view to investigating the British Aircraft industry. Mr. Love is a director of the Fokker Aircraft Corporation of America and the Universal Aviation Corporation, and he is president of Love, Bryan and Co., Investment Bankers, of St. Louis. In his group of companies in the States is included the Mono Aircraft Corporation, which makes the well-known Monocoupe light aeroplane, and the Lambert Aircraft Engine Corporation, which makes the Lambert engine, formerly known as the Velie Motors Corporation.

Mr. Love has been touring Europe to see what Continental aircraft factories can produce, and will in due course be getting in touch with British aircraft firms.

LET OTHERS SAY IT.

A Service reader writes:—

Sir,—In the current issue of The Aeroplane, page 454, you remark "The result is that practically all these units are now ordinary subscribers."

Is it not rather modest? As an ex-R.A.F. officer I would be very surprised to walk into an R.A.F. Officers' Mess and not find a copy of The Aeroplane there, unless some member had thought it worth while to incur the appropriate fine (removing papers from the Mess) so that he might read it in bed.

In Messes abroad where the papers arrive in a bunch with the weekly mail, there is always a scramble to get hold of The Aeroplane first,—only the more sedate married officers preferring to wait, and console themselves with glancing at *La Vie* ——.

In my experience (I speak as an ex-Mess Secretary who used to keep in close touch with neighbouring Mess Secretaries) the free issue of The Aeroplane rarely got beyond the vicious circle of the C.O.'s, the Adjutant's and Headquarters Offices, and though I have known on more than one occasion the question of what papers should be purchased by the Mess to come up for revision at a Mess Meeting, it was always taken for granted that The Aeroplane would be on the list.

Personally, I have read every copy (with the exception of that dated July 10, 1929, which Messrs. W. H. Smith and Sons, Folkestone, assured me was out of print) through from cover to cover ever since I first became interested in aviation.

STAG LANE NOTES.

The Gipsy Moth Amphibian was seen at Stag Lane for the first time during the week. It was flown from Rochester by Mr. Lankester Parker and aroused much interest. Mr. Broad and later Mr. Pike flew the machine and made several landings on the Welsh Harp.

This particular machine is the property of Mr. J. Scott-Taggart and was described and illustrated in The Aeroplane when it was first tested. From the enthusiasm it has aroused many more of the type are likely to be seen before long.

The Gipsy-Moth with the sealed Gipsy engine which completed five-hundred hours trouble-free running, and was one of the exhibits on the D.H. stand at the Aero Show, is now back on service again. Another fifty hours have been added to the total and there is no indication of the end of the test coming just yet.

A week or two ago one of our daily papers published a letter from a correspondent who desired to know a British engine that could bear comparison with the American that put up an endurance record of four hundred and twenty hours. The Gipsy would seem to be a good answer as one of the many.

Another D.H.66 Hercules (three Jupiters) is nearing completion for delivery to Imperial Airways. It has a new type of coupé top for the pilot's cockpit but is otherwise similar to those already in use.

Among the many Moths delivered during the week were a number for National Flying Services Ltd. and one for Mr. Gordon Selfridge, Jnr., who has recently learned to fly at the School.

Major Sir Henry Segrave visited the aerodrome on Friday and flew a Gipsy Moth.

Stag Lane presented a rather unusual sight on Saturday. Except for the activities of the London Club it was more or less deserted. This was the occasion of the Annual Works Outing when the whole of the staff went down to the sea, for the day. Thirty motor coaches were required for the job.—C. A. S.

CROYDON NOTES.

The size of the Indian mail seems to grow, steadily, week by week. On Saturday a mail consisting of over thirty thousand letters was despatched. In addition there were five passengers for various destinations along the route.

The previous week's mail was joined at Naples by a lady passenger who made the journey from London to Cairo in three days. She left Croydon on Sunday in a D.H.50, piloted by Mr. Olley, and arrived at Naples in time to catch the Calcutta on Monday evening.

Another new Argosy was flying on test on Monday afternoon. This is the fourth of the new series and makes up the number of the type to seven. Probably for the first time on record four Argosies were standing together in front of the control tower on Monday afternoon.

A very interesting light aeroplane was seen in the air during the early part of the week. This was the side-by-side two-seat biplane, a product of Surrey Flying Services. It was tested by Col. Henderson and appeared to perform very satisfactorily.

In addition to the Vickers Vixen carrying the American mails, Monday also saw the arrival of Mr. Bentley from South Africa by way of Berlin. His Moth has now done the journey between London and South Africa four times and would appear to have plenty of hours left still.

A newcomer to commercial aviation, British Air Lines, whose headquarters are at Croydon, have begun operation by taking delivery of their first machine, a Fokker FIIB (Siddeley Puma engine). The company are specialising taxi and special charter work and will shortly have a fleet of modern aircraft available for hire at any time, day and night.—C. A. S.

THE LONDON TERMINAL AERODROME.

ANALYSIS OF FIGURES FOR PAST WEEK.

Trips per Day.—Sunday, 19; Monday, 56; Tuesday, 44; Wednesday 46; Thursday, 45; Friday, 41; Saturday, 48.

Imperial Airways Ltd.:
London—Egypt—India: London—Le Touquet—Paris—Basle—Zurich London—Ostend—Brussels—Cologne and return: Machines 103, passengers 962, freight 41¼ tons. India Route: Inward, passengers 3 mail 740 lbs.; outwards: passengers 1, mail 624 lbs.

ONCE AGAIN.

At 13.30 hrs. on Aug. 26 Mr. R. R. Bentley landed at Croydon Airport in his Moth, from South Africa, this being the fourth time that he has covered the distance, twice in each direction, in his Moth.

He left Johannesburg on July 10, with Mr. E. B. Filsinger, an American business man, as passenger. Mr. Filsinger had chartered the machine to fly him to Berlin.

They flew by way of Bulawayo, Victoria Falls, Salisbury, Beira, Broken Hill, Tabora, Nairobi, Mongalla, Khartum, Atbara, Luxor, Cairo, Athens, Constantinople, Venice, Vienna, Nuremburg, Dresden, and Berlin, arriving at the last-mentioned place on Aug. 22. The distance from Johannesburg to Berlin was covered in 27 stages in 106 flying hours.

AIR MAILS IN SOUTH AFRICA.

The inauguration of *The Union Air Mail* Service took place on Aug. 26. *The Times* report states that Major Miller, who is well known as an apostle of airmindedness, left Cape Town on that date with five bags of mails, from the *s.s. Saxon.*

When Capt. Miller arrived at Port Elizabeth the mails for East London and Durban were transferred to two waiting machines, which then started for their respective destinations. Other machines carried mails to Bloemfontein and Johannesburg. The former was 65 mins. late owing to head winds.

ONE VIEW OF "THE AEROPLANE."

An unwilling subscriber to THE AEROPLANE writes:—

It is a sort of moral mosquito. I don't want to read it, and, as you know, I nearly always disagree with your opinions, but I find that if I don't a sense of growing irritation comes over me, as I am, in the absence of your journal, unable to reply to others who may have read it. As you know, it is seldom that I find myself unable to reply to anything.

VICKERS LTD. AND THE R.100.

In view of the practical completion of the Airship R.100, commonly known as the Burney Airship, at Howden there is interest in noting that this ship has been constructed by the Airship Guarantee Company, of which Vickers Ltd. own the whole of the cash capital. Referring to this matter at the Annual General Meeting of the Vickers Company in March last, the Chairman, General the Hon. Sir Herbert A. Lawrence, G.C.B., said:—

It may not be inopportune if I mention that the Vickers group of companies accept contracts for work of national importance of an experimental nature on which losses are incurred, as, for example, the giant airship R.100, now being constructed by the Airship Guarantee Company—one of our subsidiary companies. This contract was accepted in 1924, and it has been necessary to provide a considerable sum to cover the estimated loss on completion, owing to the fact that the airship has taken much longer to erect than was originally anticipated. A similar airship is being constructed by the Air Ministry at Cardington, the whole cost of which falls on the taxpayer, but Vickers, as private contractors, have to shoulder the loss themselves.

The Vickers Company also own the capital of Vickers (Aviation) Limited who in turn are the sole owners of the Supermarine Company at Southampton, who have been responsible for the construction of the Supermarine-Rolls-Royce S.6 for the forthcoming Schneider Trophy Contest.

NEW COMPANY.

COMPRESSED AIR STARTERS LTD.—Private company. Registered Aug. 15. Capital, £20,000 in 18,000 7½% cumulative participating preferred ordinary shares of £1 each and 40,000 deferred shares of 1s. each. Objects: To carry on the business of mechanical, motor, aeroplane and general engineers, metal workers, iron and brass founders, makers of and dealers in automatic starter apparatus of all kinds for engines and other purposes, etc.

The subscribers (each with one preferred ordinary share) are: M. Feldman, D.Sc., LL.D., 115, Old Broad Street, E.C.2., foreign banker. F. R. M. Irwin, 5, Copthall Avenue, E.C., stockbroker. The first directors are to be appointed by the subscribers. No qualification required. Solicitors: McKenna and Co., 31/4, Basinghall Street, E.C.2.

PERSONAL NOTICES.

DEATHS.

CREED.—On Aug. 25, at the R.A.F. Station Sick Quarters, Heliopolis, as the result of a flying accident on Aug. 25, L-AC. Mervyn Henry Creed, R.A.F.

LANGAN.—On Aug. 24, at Heliopolis, as the result of a flying accident, L./A.C. Charles Ernest Langan, R.A.F.

MELVILLE.—On Aug. 24, at Heliopolis, as the result of a flying accident, Sjt. John Melville, R.A.F.

STAFFORD.—On Aug. 16, at Camp Borden, Ontario, as the result of a flying accident, Flg. Off. Stafford, Royal Canadian Air Force.

WILSON.—On Aug. 24, at Heliopolis, as the result of a flying accident, John Wilson, Plt. Off., R.A.F.

Mr. Wilson joined the R.A.F. with a short-service commission in May, 1928, and after a course of flying training at No. 4 Flying Training School, Abu Sueil, Egypt, was posted to No. 216 (Bomber) Squadron, Heliopolis.

MARRIAGE.

HILBORNE—WHEATLAND.—On Aug. 19, at Harrow, Frederick Wilfred Hilborne, Chaplain, R.A.F., youngest son of Mr. and Mrs. Hilborne, Bexhill, to Irene May, elder daughter of Mr. and Mrs. Russell Wheatland, of Harrow.

FORTHCOMING MARRIAGE.

DAVID—MACKENZIE.—The engagement is announced between Flt. Lt. Hugh Markham David, R.A.F., second son of Lieut.-Col. M. David, D.S.O., and Mrs. David, of Warwick Mansions, Cromwell Crescent, S.W.7, and Geraldine Fassefern, youngest daughter of the late Rev. Angus Cameron Mackenzie, of Dundee, and Mrs. Cameron Mackenzie, of St. Petersburgh Place, W.2.

SCHNEIDER TROPHY CONTEST.

Schneider Trophy.—Gentleman will take guests on his 113-ton yacht for the Schneider Cup at either £3 a day or by arrangement. Apply BM/A.S.S., London, W.C.1.

Schneider Trophy Race.—Parking space will be available at Apse Manor Aerodrome, 1 mile N.W. of Shanklin during week of race. Petrol pumps on the spot and also licensed ground staff. Apply Inland Flying Services Ltd., at the Aerodrome.

Orford.—Passengers unable occupy 2 berth outside cabin will accept twenty-five guineas or best offer. Box No. 5703, The Aeroplane, Cannon House, Pilgrim Street, E.C.4.

PRACTICAL FLYING.

BROOKLANDS SCHOOL OF FLYING employs three pilots who have been instructing since 1916. Take advantage of their experience and let them teach you on a Moth or an Avro. Private accommodation on the aerodrome, which is only 50 minutes by rail or road from Waterloo. 'Phone: Byfleet 436-7.

HENDERSON FLYING SCHOOL.—Lt.-Col. Henderson offers unique terms both for "A" and "B" licences. All technical coaching arranged for. Personal attention. Minimum rates. Write to Croydon Aerodrome.

CINQUE PORTS Flying Club (Subsidised) gives cheapest tuition ever offered. Monthly sub. 21s. for 28 days. (No entry fee.) Annual subscription 63s. (entrance 21s.). Moth Equipment—Club-room, Bar and Lawn—Perfect Aerodrome near Folkestone, 1¾ road hours from West-End. No waiting list. Write Secretary, Hythe, Kent.—**LEARN AT LYMPNE.**

CHEAPEST FLYING IN THE WORLD! at the Norfolk and Norwich Aero Club. Subscription £3 3s. Instruction rates 25s. per hour. Accommodation can be arranged on Aerodrome. Applications to Secretary, Mousehold Aerodrome, Norwich.

Learn to Fly at the Midland Aero Club. Four tuition machines, two fully qualified expert instructors. No waiting. Particulars Hon. Secretary, 22, Villa Road, Handsworth, Birmingham.

PHILLIPS AND POWIS SCHOOL OF FLYING—An "A" licence in the shortest time and the lowest cost at Reading. Personal attention, no waiting, concentrated instruction. Gipsy Moths. The School is very successful in turning out good pilots in a minimum of time. Write for particulars of recent successes. Make it a flying holiday. Special August offer, trial lesson 12s. 6d. 45 minutes Paddington.—Reading Aerodrome. 'Phone Sonning 114.

Surrey Flying Services, Croydon Aerodrome (Telephone Croydon 1736) have vacancies in their flying school for pupils at moderate rates. Avro aircraft used. Residential accommodation at Aerodrome Hotel.

Southern Aero Club.—Thorough Avro tuition, no waiting list. "B" licences instruction arranged. Apply Secretary, Shoreham Aerodrome, Sussex.

The De Havilland School of Flying, Stag Lane Aerodrome, Edgware, Middlesex. Fourteen machines: Nine Moths, five advanced training machines, Seven Pilot Instructors, Lecture Classes, Restaurant and Recreation Pavilion. The largest and most up-to-date civilian organisation for flying tuition in the British Empire.

SITUATIONS VACANT.

Estimator required, capable of fully estimating Aero and Automobile Engine parts for tender, and laying out subsequent work for machining. State fully, details of experience, age and wages required. No application will be considered without these details.—Box No. 5705, The Aeroplane, Cannon House, Pilgrim Street, E.C.4.

Fitters, erectors and tool makers, preferably used to aircraft construction, required immediately, District rate plus production bonus. Long job for capable men. Apply Westland Aircraft Works, Yeovil, Somerset.

SITUATIONS WANTED.

"B" Licence Pilot requires situation, 1,400 hrs., excellent record.—Apply Box No. 5702, The Aeroplane, Cannon House, Pilgrim Street, E.C.4.

Pilot "B" Licence, now free. Good references.—Apply Box No. 5701, The Aeroplane, Cannon House, Pilgrim Street, E.C.4.

Ground Engineer requires post. Licensed categories A. and C. All engines. 10 years' experience, various types, overhauls and maintenance.—Box No. 5704, The Aeroplane, Cannon House, Pilgrim Street, E.C.4.

TUITION.

We offer sound instruction in Aeroplane Design, Fitting and Rigging, and Aero-Engine Fitting and Rigging; also expert training for Ground Engineers (Categories A, B, C and D). All tuition is by correspondence. Write to-day for our "Aeronautical Engineering" Booklet. International Correspondence Schools Ltd., 179, International Buildings, Kingsway, London, W.C.2.

MISCELLANEOUS.

ON THE HISTORY OF THE SCHNEIDER CONTEST.

The Schneider Trophy Contest is generally called the Schneider Cup Race because it is not a race, in that the competing machines do not race against one another but fly against Time, and the prize is not a Cup but a group of statuary which would certainly not hold any liquid.

The Trophy was presented to the *Fédération Aéronautique Internationale,* the body which governs international air sport, by M. Jacques Schneider, at the Gordon Bennett Banquet held by the Aero Club de France on December 5, 1912. The Trophy itself was at that time valued at £1,000, and with it M. Schneider presented prize-money amounting to £1,000 for each of the three first contests.

M. Jacques Schneider was the son of the head of the great Schneider Gun Works at Creusot. He died in poverty in France last year, at a time when England, France, Italy and America between them must have been spending well over a million pounds in the hope of winning his Trophy.

In presenting the Trophy M. Schneider dedicated it to a competition for seaplanes, his idea being to encourage the development of sea-going aircraft. Part of the original rules were that the course was to be laid over open sea. Those who look at the Schneider speed machines of to-day will see how little they resemble any possible sea-going aircraft. And the phrase "*plein mer,*" or open sea, has been distorted to include land-locked water such as Chesapeake Bay, sheltered areas such as the Bay of Naples and the head of the Adriatic outside the Lido, and water protected by an island as is the Solent. So the original title "The Jacques Schneider Maritime Trophy" is something of a joke. Nevertheless, poor Jacques Schneider has conferred a great benefit on aviation.

OUR ONLY CLASSIC CONTEST.

The Gordon Bennett Cup for land machines was won outright by France in 1920. It was succeeded, in somewhat diminished esteem, by the Deutsch Cup presented in his memory by the family of the late Henry Deutsch de la Meurthe. That was also won outright by France in 1922. And there were no more classic contests for land-going aircraft.

There remained only the Schneider Trophy as the prize for a Classic Contest, and on it seems to have descended all the glamour which once surrounded Gordon Bennett Car Races and Gordon Bennett air competitions and everything else of that nature, in that the people of the countries concerned are as interested in a contest they are never likely to see as if they were competing themselves. At kinema theatres the audiences rise and cheer pictures of our Schneider team, as they would a picture of Mr. Snowden—the only outspoken English politician—or the winning crew after the Boat Race. The fact is a curious example of psychological momentum.

For the first time in History, instead of individual sportsmen competing against individual sportsmen for honour and glory, or instead of rich manufacturers competing against rich manufacturers for the consequent advertisement,—which is what always happens in the big motor car races, and what happened in the flying contests for the Gordon Bennett Cup and the Deutsch Cup, the Schneider Trophy has attained the dignity of International Competition between Governments.

In the early competitions aircraft constructors paid the bill. But now the National Exchequers pay, and charge up the cost to Scientific Research or Technical Development. Though this will probably be the last time.

THE FIRST CONTEST—1913.

The first contest for the Schneider Trophy was held at Monaco on April 16, 1913. It was won by M. Prévost in a Deperdussin float seaplane with a 160 h.p. Gnôme engine. He covered 150 sea miles in 3 hr. 48 min. 22 sec., so his speed was 39.4 knots (45.25 land miles per hour).

M. Prévost's name deserves to survive in aeronautical history for another reason besides winning the Schneider Trophy. In 1912 in a Deperdussin monoplane designed conjointly by M. Bêchéreau and Mr. Koolhoven he was the first human being to travel 120 miles in an hour,—that is to say, to do two miles a minute flat for an hour on end.

In this connection there is a story which combines curiously romance and humour. M. Deperdussin was a silk dealer in Lyons in a good way of business. He became fascinated by aviation and he spent money lavishly on building aircraft. He discovered some of the World's best designers and he gave them a free hand.

He had hopes of French Government orders, for war machines no doubt, but unfortunately to finance his aircraft developments, he worked a clever and elaborate swindle on the silk trade with the result that he landed himself in jail for several years. And when Prévost won the Gordon Bennett Cup and did his 120 miles in the hour at Reims, the Deperdussin team sent a telegram of con-

THE SCENE OF ACTION.—The Royal Air Force Station at Calshot on the Solent, where the Schneider Teams are quartered and trials are being held. The long shed on the right houses the competing aircraft, which are launched from the slipway on the right into the Solent, or from that in the background into Southampton Water.—(*R.A.F. This speaks for itself

CIRRUS ENGINE

50,000 MILES

London,
27th August, 1929.

Cirrus Aero-Engines Ltd.,
Regent House,
KINGSWAY,
LONDON, W.C.2.

Dear Sirs,

On completion of the second round trip London - South Africa - London, I have nothing but praise to offer for CIRRUS Engine No. 85 Mod/III, which has thus completed, with the utmost reliability, an air mileage of something over 50,000.

It can be readily seen that the engine is in no way suffering from 'Anno Domini', and that I set out on this latest trip from South Africa to England with just as much confidence as setting out on a short joy-flight.

Knowing that you will endeavour always to impart the same features of reliability into all your future engines, may I congratulate you on the excellence of all your previous productions.

Yours faithfully,

R.A. Bentley

OUR FIRST WINNER.—Mr. Howard Pixton sitting on the wing of his Sopwith Biplane (Mono-Gnôme).

gratulation to M. Deperdussin "To our good patron in prison."

Later the remains of the Deperdussin company was bought by M. Blériot and was called "*Le Société Pour les Appareils Deperdussin,*" whence comes the name Spad of warlike memory.

THE SECOND CONTEST—1914.

The second competition for the Schneider Trophy was held at Monaco on April 20, 1914, over the same course as the 1913 contest. It was won by Mr. Howard Pixton in a Sopwith float seaplane with a 100 h.p. Monosoupape Gnôme engine. He covered 150 sea miles in 2 hr. 0 min. 16 sec., and his speed was 74.7 knots (86 m.p.h.).

The Sopwith aeroplanes at that time were being built at the expense of Mr. T. O. M. Sopwith, then a well-to-do young sportsman of the kind who so often wastes his substance on slow horses and fast women. But Thomas Octavius Murdoch Sopwith preferred automobile sport. He had fast cars and fast motor-boats, and his engineer in charge of them all was one Fred Sigrist, a Heaven-sent mechanic and humorist.

Naturally flying appealed to them both. Mr. Sopwith bought a Howard Wright monoplane. Then he bought a Howard Wright biplane. Then he bought a Blériot. Then he went to America and put up excellent exhibitions against the crack American pilots of Wrights and Curtisses.

He came back to England somewhere about the end of 1911 and was taken with the idea of becoming a manufacturer. He built one of the first tractor biplanes in this country,—with wings more or less on the principle of the Wright biplanes. And he brought back from America with him a Wright biplane, which he fitted with civilised controls and a decent engine, and on it the famous Harry Hawker learned to fly. They were joined after a while by one Howard Pixton, who had learned to fly on an Avro at Brooklands.

Mr. Sopwith took a skating rink, which still exists, close to Kingston Station, and there he and Sigrist and Hawker proceeded to design aeroplanes by the simple process of drawing the plan view in chalk on the floor of the rink and drawing the elevation on the wall, full size. In 1912 they produced the Sopwith Tabloid, which was the first really small high-speed single-seater. It did somewhere over 80 miles an hour with a 50 h.p. Gnôme,—which really gave about 33 h.p.

From it descended directly the Schneider Sopwith which was the first machine to win the Schneider Trophy for us. And from that descended all the Sopwith Schneiders which were used by the Naval Air Service during the War and the Sopwith Pups used by the R.F.C., and all that long line of Sopwith war machines which did so much to win for us the supremacy of the air.

There was one very remarkable thing about Mr. Pixton's win. The 100 h.p. Monosoupape Gnôme of that day gave a very doubtful 100 h.p., and after he had travelled about one-third of the distance one cylinder cut right out, owing to an oily sparking plug or something, with the result that he flew the rest of the way with only eight cylinders firing. And yet his speed, 86 miles an hour, would be considered quite good for any modern light aeroplane with rather more horse power, and unhampered by floats,—for those tubby little pontoons on the Sopwith were not almost perfect streamlines as are those on the modern Schneider speed machines.

There is also a story about that particular contest which is worth telling as an example of true English self-possession. After he had won, Mr. Pixton was taken up to the sacred enclosure in the Grand Tribune, up in Monte Carlo, where a *champagne d'honneur* was being held, and was asked what he would have, there being the choice of all the

THE NAPIER ENGINE has demonstrated beyond doubt its superiority over any other engine. Whether for high speed, long distance or duration, the Napier has shown itself the most efficient and reliable engine in the world.

The following are a few of its more recent achievements :—

THE FIRST NON-STOP FLIGHT FROM ENGLAND TO INDIA was accomplished by a Royal Air Force Fairey monoplane fitted with **NAPIER** engine —**4,130** miles in 50 hours 38 minutes.

THE FIRST FORMATION FLIGHT FROM ENGLAND TO AUSTRALIA was achieved by four Royal Air Force Supermarine "Southampton" flying boats each fitted with two **NAPIER** engines—**180,800** engine miles without mechanical trouble.

THE HIGHEST SPEED IN THE AIR was accomplished by Flight-Lieut. D. D'Arcy Greig with a Supermarine seaplane with **NAPIER** engine—speed **319½** m.p.h.

THE HIGHEST SPEED ON LAND was set up by Major-Sir Henry Segrave on his Irving-Napier special with **NAPIER** engine.

Captain Malcolm Campbell set up world's land speed records for 5 miles and 5 kilometres with his Napier engined car.

NO OTHER ENGINE HAS SUCH A RECORD OF ACHIEVEMENT

An Invaluable Aid to "Blind Flying"...

Pioneer Climb Indicator
Actual Size

Weight Complete 1.8 pounds
Depth—face to rear—4¾ inches

Ask for descriptive literature

Since its organization on March 1, 1919, the Pioneer Instrument Company has devoted itself exclusively to the design, development and manufacture of aircraft instruments and equipment.

THE PIONEER CLIMB INDICATOR is of great assistance in maintaining the desired altitude and the proper longitudinal position whenever visibility is impaired. This instrument also enables the pilot to climb at the most rapid rate or descend as slowly as possible without stalling.

The principal American air transportation lines have adopted the Pioneer Climb Indicator. It is sturdy and dependable, it is light in weight; and its compactness allows a convenient arrangement of instruments on the board.

Send for pamphlets telling more about the Pioneer Climb Indicator and other Pioneer Aircraft Instruments. We manufacture and distribute a complete line.

most noble brands of champagne in France. And Mr. Pixton, true to all our insular prejudices, replied, "Thank you, mine's a Bass."—And that was fifteen years before every hoarding informed us that this Bass is great stuff. Howard Pixton knew what he wanted and meant to have it, and he deserved it.

After the War the Sopwith Aviation Co. was wound up, and paid everybody 20s. in the £. Harry Hawker died in the air while testing a speed machine. But the Hawker Engineering Co., which was founded by Mr. Sopwith, Mr. Sigrist and Mr. Hawker conjointly, survives, and to-day produces, as the old Sopwith Co. did, some of our finest war machines. And Fred Sigrist is still one of the finest practical engineers we have ever produced.

THE THIRD COMPETITION—1919.

According to the competition rules, the country whose representative wins the Schneider Trophy is charged with the organisation of the next contest. And so the duty next time fell upon England.

In 1915, 1916, 1917 and 1918 the competition was suspended owing to an unfortunate inter-tribal dispute in Europe which did a great deal to delay the development of aircraft by giving us entirely false values for money, material, manpower, and engine power alike.

Therefore the third competition was organised at Bournemouth in 1919. This time, as we propose to do this year, the Royal Aero Club Committee and friends did themselves well by chartering a ship,—a yacht belonging to Mr. Montagu Grahame-White,—as their headquarters.

The weather was beautiful, in the early part of the day, and we had a delightful trip from Cowes to Bournemouth, and everything seemed as it should be, till unfortunately a Channel fog rolled up and blotted out most of the course. Consequently no competitor managed to find the turning points properly.

Nevertheless, because the Italian pilot, Signor Janello, in a Savoia flying-boat, came nearest to covering the proper course, the possession of the Trophy was held in suspense, but the *Fédération Aéronautique Internationale* decreed that the contest in the following year should be held in Italy.

Here may be added the fact that everybody thought that Signor Janello had covered the proper course till somebody on the official boat discovered that he had covered one lap in several minutes faster time than any of the others, and that his official lap time would have meant that his machine was doing a speed of which it was obviously incapable. And then inquiry from the turning points proved that he had not passed one particular point, and that another machine wandering in the fog must have been mistaken for him.

The competitors in that contest were France, Italy and Great Britain. The British machines were a Fairey float-biplane, a Supermarine flying-boat, and a Sopwith float-biplane.

THE FOURTH CONTEST—1920.

Anyhow, the result was that the fourth competition was flown at Venice on September 21, 1920. No English machine competed. The French machines were wrecked during the Sea-worthiness Test, and the winner was Signor Luigi Bologna in a Savoia S.19 flying-boat with a 550 h.p. Ansaldo engine.

This time the distance was 202 sea miles, covered in 2 hr. 10 min. 35 sec. The speed was 92.9 knots (106.7 m.p.h.)

THE FIFTH CONTEST—1921.

The fifth competition was flown on Aug. 7, 1921, at Venice. Again there were no foreign competitors. The winner was Signor Giovanni de Briganti in a Macchi VII flying-boat with a 250 h.p. Isotta-Fraschini engine. The distance was 200 sea miles and the time was 2 hr. 4 min. 29 sec. The speed was 96.5 knots (110.9 m.p.h.).

THE ROAD TO VICTORY.—Mr. Pixton passing the Casino at Monte Carlo.

THE SIXTH CONTEST—1922.

The sixth competition was held on August 12, 1922, at Naples. This time England was represented, thanks to a thoroughly sporting effort on the part of the Supermarine Aviation Works for which Squadron Commander James Bird, late R.N., and Mr. Hubert Scott-Paine were responsible.

The Supermarine Company has always been a thoroughly sporting affair. It was started in the very early days before the War by that erratic genius, Mr. Pemberton Billing, and in his day produced a number of startling ideas in aircraft design some of which might well be developed to-day with advantage to British Aviation, and others of which will definitely be developed in the future and will do much to make commercial flying possible.

When, during the War, he sold the business to devote himself to politics, Mr. Scott-Paine, who began his commercial life sea-faring with Mr. Pemberton Billing, took control of

AT BALTIMORE.—Mr. Broad getting off in the Gloster-Napier III of 1925.

the business, and was later joined by Squadron Commander Bird, R.N., who resigned from the R.N.A.S. to join the Supermarine Works,—hence the fact that he is one of the very few men who bears what is now an obsolete rank-title of the Royal Navy.

These two good sportsmen in 1922 built a flying-boat and took it all the way to Naples at their own expense without any co-operation with the united aircraft firms of the great British Empire, and without any Government backing. The Napier engine firm were their only collaborators,—the more more honour to both firms.

Mr. Henri Biard won the contest in a Supermarine Sea-Lion II flying-boat with a 450 h.p. Napier Lion engine. The distance was 202.2 sea miles and the time was 1 hr. 34 min. 51 sec. The speed was 126.8 knots (145.7 m.p.h.).

This jump of 35 m.p.h. began to make people think that after all a sea-going aircraft might be made nearly as fast as a land machine,—for during the War some of our single-seat fighters and two seaters were doing as much as 150 m.p.h. a speed which is still unequalled by many of the machines still in use by the Royal Air Force for the same Service purposes.

THE SEVENTH CONTEST—1923.

England having won the sixth contest, the next was held at Cowes on September 28, 1923. This year, for the first time, Government competition came into the game.

The United States Navy resolved to make an attack on our Schneider Trophy for the honour of American Aviation. The winner was Lieutenant David Rittenhouse, U.S. Navy, in a Curtiss float seaplane, C.R.3 type, with a 465 h.p. Curtiss D.12a engine.

The distance was 186 sea miles, covered in 1 hr. 12 min. 26 sec. The speed was 154 knots (177.38 m.p.h.). Here was another jump of over 30 miles per hour, and for the first time seaplane speed was put over land machine speed, and people began to think that because of the danger of getting machines with wheels onto the ground at the high landing speeds forced upon them by these high flying speeds, seaplanes might ultimately pass the speeds of land machines.

The U.S. Government, having made up their minds to take a hand in the competition, went about the job properly. They sent the cruiser *Pittsburgh* to Cowes to act as a tender to the little aircraft. And incidentally the *Pittsburgh* brought to Cowes the very best saxophone band and the very best cocktails that one has ever met. Nobody ever having seen a warship lending a hand at a sporting contest there were people at Cowes who said that the *Pittsburgh* had the intention of blowing Cowes out of the water if an American machine did not win.

This contest was the first in which the new ideas of streamlining and of fuselage contours introduced by the Curtiss Company were seen. And it marked the beginning of a new phase in aeronautical history.

The fame of the Curtiss Company really began with the winning of the first Gordon Bennett Race at Reims in 1909 by Mr. Glenn H. Curtiss, as a gallant lone-hand raid on European Aviation. Glenn Curtiss was the great and victorious rival of the Wright Brothers in the very earliest days of flying in America.

The Wright biplane was the first to fly undoubtedly, but the succession of Curtiss biplanes were the first aeroplanes to fly successfully. The Wright aircraft faded away into oblivion before the War, but the Curtiss Company supplied us with a very large proportion of our best training machines and our best big flying-boats, and to-day the Curtiss Company is the biggest aeronautical concern in the World.

After the War, like so many other aircraft firms, the Curtiss Co. got into low water financially, and somewhere about 1921 a quiet little Canadian, named Clement M. Keys, who had already made a name in Wall Street, took hold of the Curtiss Co. and made up his mind to reform it.

A good many years ago C. M. Keys told one that he had no interest in financing successful concerns. The only sport that appealed to him was taking hold of a good firm that was on the verge of bankruptcy and forcing it up to success, or starting out on a new line of development in which few people believed. Hence his taking hold of National Air Transport and Transcontinental Air Transport (N.A.T. and T.A.T., as they are known in the States),—the two greatest air-mail and air-passenger concerns in the World.

A few days ago in London C. M. Keys showed one a list

UNTOUCHED

(FLYING TIME)

With the additional time for running up and taxying the total number of hours the engine has run is 593 — without being touched.

UNBROKEN

THIS remarkable tour has no parallel in the history of aviation. Since December 29th, 1928, when the test was started this standard Gipsy engine, selected at random from the flow of production, has flown 46,750 miles, treated with complete neglect. Attention has been confined to the routine cleaning of filters and sparking plugs, the checking of valve clearances and the correction of a minor defect in one magneto.

The seals fixed by Government Officials make it **IMPOSSIBLE TO CARRY OUT ANY ADJUSTMENTS AND TO MAKE ANY REPLACEMENTS.** The rockers and the cylinder heads are sealed to the cylinders, the cylinders are sealed to the crank case, the two halves of the crank case are sealed together, the oil pump is sealed to the crank case, the magnetos are sealed to the crank case, the carburettor is sealed to the induction pipe, and all four cylinders are sealed together. **NOTHING CAN BE TOUCHED.**

* * *

This outstanding achievement is just one more demonstration of the robustness of the 100 h.p. Gipsy Engine, following its world's records, its innumerable long distance tours, its use in hundreds of light aircraft — enhancing still more its world wide reputation for **UTTER DEPENDABILITY.**

of the various subsidiary, ancillary and allied concerns which now come inside the great group of aircraft manufacturing and operating concerns which are known as the Curtiss-Wright Group, of which he is the controlling head. And their capital value on the New York market to-day is a trifle over £35,000,000 (not dollars).

The performance of those Curtiss machines at Cowes so impressed Mr. C. R. Fairey, one of the most brilliant aeronautical engineers and financiers in the World, that before the end of the year he had gone to America and had bought the Curtiss patents and designs for this country. The first result was the Fairey Fox, which one still holds is the most beautiful biplane in the World to-day, and certainly has about the best biplane performance of its type and power. And to-day practically every aeroplane in the World which has a first-class speed performance conforms to the lines of those Curtiss Schneider machines of 1923.

THE CONTEST WHICH WAS NOT—1924.

America having won the Trophy, the next competition was due to be held at Baltimore on October 25, 1924. British and Italian machines had been entered. But the Italian machines made no attempt to appear, and the sole and only British entry was wrecked a day or two before it was due to leave for the States.

Competition being thus removed, the U.S. Navy, who had spent a lot of money on building new craft to defend the Trophy, might have flown their machines over the course and have claimed another win on the Trophy, thus putting them a point nearer making it their own property. If they had done so that would only have had to win it once more to make it their own. But the U.S. Navy. happen to be sportsmen and gentlemen, so they refused to fly over the course for the Trophy, and contented themselves with sending their speed machines for records,—and getting them.

Under the regulations, the Schneider Trophy has to be won three times in five consecutive competitions to become the property of the nation which wins it. And if the Americans had claimed a win in 1924 they would now be the owners of the Trophy by virtue of having won it in 1925.

THE EIGHTH CONTEST—1925.

The eighth contest was flown at Baltimore on October 26, 1925. It was postponed from October 24 because of strong easterly winds and heavy rain. The Trophy was won by Lieut. James Doolittle, U.S. Army Air Service, in a Curtiss R3C2, with a Curtiss V1400 engine. The distance was 350 kilometres. His speed was 232.57 m.p.h., and the time was 56 min. 6 sec.

Mr. Hubert Broad in a Gloster-Napier III, was second, but his speed was only about 199 m.p.h., although the machine had done over 230 m.p.h. in practice.

There is interest here in noting that before going to the States for the Contest the Supermarine S.4 had put up a World's Record of 227 m.p.h. over the official kilometre course. This machine was unfortunately wrecked at Baltimore in the bad weather before the contest. And another Gloster-Napier III with Mr. Bert Hinkler as pilot was also damaged while being tested.

Two U.S. Naval Officers, Lieut. Cuddihy and Lieut. Ofstie, also in Curtisses, started in the contest but did not finish. The third competitor to finish was Signor de Briganti in a Macchi 33 flying-boat, with a Curtiss D.12 engine. This machine was a queer little monoplane flying-boat with the engine perched up on stilts above the hull in the manner introduced by Herr Dornier and Doctor Rohrbach. Its speed was only about 170 m.p.h.

This contest was notable because it was the first competition in which a Gloucester Racer had competed on floats.

Like almost all aircraft firms, the Gloucester Co. has had an interesting, even romantic, beginning. During the War 1914-18, when everybody who possessed suitable metal-working and wood-working machinery and had the call on hands skilled in working those materials, was roped in to build war machines, the great firm of H. H. Martyn and Co. of Cheltenham came into the business.

Their chief trade was, and still is, the furnishing of ocean liners. Their men were accustomed to doing all that amazing wood-fitting and panelling and carving which makes the liners of to-day look even more luxurious than the most luxurious hotels. The result of the skill of their trained men was that the various aircraft which were built by the Martyn firm of sub-contractors won at once a high reputation for workmanship. The Aircraft Department was formed into a separate firm as The Gloucestershire Aircraft Co. Ltd.

After the War, instead of pocketing their profits and cutting out of the aircraft game, as mere war-profiteers did, the Gloucester Co. made up their minds to back their faith in aircraft. And all credit is due to Mr. David Longden and Mr. A. W. Martyn for their pluck in doing so.

Having resolved to stick to aircraft they engaged Mr. H. P. Folland, who, having been one of the bright particular stars of the Royal Aircraft Factory had gone to the British Nieuport Co. Ltd., as designer, and looked like being more or less left on the beach when the proprietor of that firm, Lord Waring, resolved to close down.

Encouraged by Mr. Longden's faith, the Gloucester Co. started to make speed machines. Mr. Folland's first design in this direction was a really fast aeroplane with a Napier Lion engine which was nicknamed the Bamel. This machine won a number of speed competitions, including the Aerial Derby, and it put up British speed records which for about the first time in our history brought us very near World's record speeds.

The Bamel was modified year after year, and when the Gloucester Co. decided to put in a machine for the Schneider Trophy contest in 1924 the old Bamel was put on floats and used as a practice machine.

Year after year the Gloucester Co. built speed machines and entered machines for the various Air Ministry competitions for fighting machines, but without getting any contracts worth while,—chiefly because during those lean years the Air Ministry had no money to spend on new types of fighting machines.

Still, Mr. Longden pluckily stuck to his policy, and in the end the Gloster Grebes and the Gloster Gamecocks became in turn standard equipment for R.A.F. fighting squadrons. But the money that the firm spent in building speed machines, and in sending them about to competitions

all over the place, including Deutsch Cup races in France and the Schneider Trophy contests in America, must have taken a good deal of the shine off the profits when the contracts at last came along.

The more credit is therefore due to the firm for the way in which it upheld British prestige in International contests at a time when money was scarce, and when our millionaire sportsmen were again spending their tens of thousands on extravagant horses and still more extravagant yachts without any consideration of the immense importance of maintaining British prestige in the air.

Here one may justifiably pay a tribute to the sportsmanship of the Directors of the Napier Company. Mr. Montagu Napier and Mr. H. T. Vane, like Mr. Scott Paine and Squadron-Commander Bird, and Mr. Longden and Mr. Martyn, believed firmly in the future of aviation and in the importance of maintaining British prestige.

The Napier Lion had only been brought to a state of reliability just at the outbreak of Peace. It was never used, at any rate in any quantities, in actual war.

Having made a thoroughly reliable engine of it and having got large Air Force orders, the Napier company might well have been content to go on turning out a thoroughly reliable working engine. But Mr. Vane is not built that way. He preferred to spend a reasonable portion of his profits in boosting the power of the engine so as to boost it by way of publicity.

One believes that one is accurate, and one believes that nobody will be offended, when one says that all the Napier engines which beat British speed records and competed in Schneider Trophy contests and brought the Schneider Trophy to England, were built and boosted at the expense of the Napier firm until the British Government stepped in, spurred to action by the U.S. Government, and paid for the building and experimenting of special engines on a scale which no industrial firm could possibly afford as a matter of sportsmanship or even for the sake of publicity. And to Mr. Vane and Mr. Napier therefore must go a large share of the credit for the reputation which British aircraft material holds.

THE NINTH CONTEST—1926.

The U.S. Army having beaten the U.S. Navy in an alleged seaplane contest in 1925, the next year's competition also had to be held in America.

This time the contest was flown on November 13 and the winner was Major Mario de Bernardi in a Macchi 39 monoplane (800 h.p. Fiat A.S.2). The distance was 350 kilometres (214 miles). The winner's speed was 246.5 m.p.h.

The Italian team consisted of three Macchi 39s, and the American team of three R3C Curtiss biplanes, belonging to the U.S. Navy, one with a 600 h.p. Curtiss, known as the V.1400, which was the identical machine used by Lieut. Doolittle, the winner in the previous year; one with a 750 h.p. Curtiss, known as the V1550, and one with a 700 h.p. geared Packard engine. There were no competitors from other nations.

A peculiarly interesting point about the contest in this year was that the winning Macchi was to all intents and purposes a Curtiss with the upper wing cut off.

The little Macchi boats of the previous year had been a complete failure, but the Italians, as readers may remember, had bought Curtiss D.12 engines for their machines. The Fiat A.S.2 engine had a very strong likeness to the D.12, and the fuselage and floats of the Macchi were almost identical with those of the Curtiss. But the Macchi designer having decided to make his machine a monoplane had put the wing under the fuselage just in the way that the lower wing of the Curtiss biplane was fitted, instead of putting his wing half way up the fuselage as it was in the Supermarine S.4 of the previous year.

THE TENTH COMPETITION—1927.

The competition in 1927 was flown at Venice, because of Major de Bernardi's win in America. After being postponed for a day owing to bad weather, the contest was flown on Monday, Sept. 26. The only entrants were three Italian Macchis with Fiat engines, and three English machines. These three were a Supermarine S.5 with a geared Napier, a Supermarine S.5 with a direct-drive Napier, and a Gloster IV. with a geared Napier.

The first machine, which was flown by Flt. Lt. S. N. Webster, won. It covered the 350 kilometres in 46min. 20.3sec. The speed was 281.49 m.p.h.

This beat handsomely the World's Speed Record made over a straight 3-kilometre course on a land machine. On the straight stretches of the course Flt. Lt. Webster must have been travelling at well over 300 miles an hour.

Flt.-Lt. O. E. Worsley, on the direct-drive Napier, covered the course at 272.9 m.p.h., and was the only other competitor to finish. Flt.-Lt. S. M. Kinkead, who was flying the Gloster, had to retire owing to a cracked airscrew shaft, which set his airscrew vibrating till his wing radiators began to jump off the wings. All the Italian engines collapsed.

This contest was notable because it was the first time that any human being in any form of vehicle had travelled at 300 miles an hour. Somehow or another, 5 miles a minute or 300 miles an hour, is one of the outstanding round figures which the human mind seems to grasp and remember easily.

Another interesting point about the contest was that up till the last moment we were all hoping against hope that the one promised, and promising, American competitor would arrive. This competitor was that same Lieut. Alford Williams, U.S.N., who has kept everybody guessing this year. And the engine which kept him guessing was a 4-bank X type Packard engine, very like that which seems to have been worrying him so much this year.

Also his machine, a float biplane, was very like his monoplane which has been so copiously illustrated in all British papers during the past few weeks, except that he had not then copied the Macchi tail.

Apparently he has this year, 1929, made the mistake of not copying our floats quite correctly, and has failed to get off the water. So the U.S. Navy has, very properly, refused to let him bring his machine over here.

We all very much regret this year that there will be no American competitor. Whenever the U.S. Army or the U.S. Navy have competed in the Schneider Trophy Contest they have not only put up a first-class show, but they have acted as first-class sportsmen, and the individual members of their teams have been of the very best. Every time we have competed against Americans we have always learned something useful from their aeroplanes and from their engines

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

Digitized by Google

and we have always made lasting friendships with some or other of their team. And they have always supplied us with good stories and phrases which have sooner or later entered into the English language.

So will our friends in America please take this paragraph of this article as an expression of the sincere regret that we all in British Aviation feel at their absence? Our only consolation is that so many of our best friends from the States have come over here to see the Schneider show. And we hope most sincerely that it will provide them with adequate entertainment.

If the weather should be fine next Friday and Saturday, we should see a fine contest, for—be the fact remembered—we and our Italian competitors start level in lack of experience of the new machines.

Although our four new speed machines have been ready for two or three weeks, the wind or fog on the Solent has prevented our team from getting any practice in their new mounts, and from correcting any last-minute errors.

Our team and the Italian team have had about an equal amount of practice in two-year-old craft; but there is nothing between them in their inexperience of the 1929 types. So, if our team's machines stand up to the contest and the Italians fail—or the other way round—that will be purely a matter of all-round engineering ability—including material, design, and workmanship.

In such events as these the result always depends on something quite unexpected, so let us all hope that, whatever happens, the best man and the best machine may win.

C. G. G.

THE BRITISH SCHNEIDER TEAM.

Squadron-Leader A. H. Orlebar, A.F.C.

Squadron-Leader A. H. Orlebar, A.F.C., *p.s.a.*, who is in command of the High Speed Flight, was born at Higham Ferrers, Northamptonshire, in 1896, and was educated at Rugby.

He was appointed 2nd Lieutenant in the 5th Battalion, the Bedfordshire Regiment (T.F.), in January, 1915, and promoted to Lieutenant in September, 1915. He served with his Regiment in Gallipoli, and was wounded in action.

In September, 1916, he was seconded to the Royal Flying Corps with the rank of Flying Officer. He served with the R.F.C. in France until July, 1917. In December, 1917, he was appointed Flight Commander with the temporary rank of Captain, and in January, 1918, he returned to France. In March, 1918, he was again wounded in action while serving with No. 73 Squadron. On his return to France, he joined No. 43 Squadron.

In August, 1919, he was apointed to a permanent commission in the Royal Air Force with the rank of Flight-Lieutenant. At the same time he relinquished his commission in the Territorial Force.

In March, 1920, he was posted to the Aeroplane Experimental Establishment, Martlesham Heath.

In December, 1921, he was awarded the Air Force Cross for valuable flying services.

In July, 1923, he was appointed to No. 22 (Bombing) Squadron, which is included in the establishment of the Aeroplane and Armament Establishment. In 1925-26 he completed a course at the R.A.F. Staff College, Andover.

In April, 1926, he was posted to No. 22 Group Headquarters for Air Staff Duties, and in September, 1926, he was posted to Headquarters, 'Iraq Command, for Air Staff Duties.

In June, 1927, he was restored to the Home Establishment and placed on the non-effective (sick) list. In September, 1927, he was posted to the Directorate of Organisation and Staff Duties, Air Ministry.

He was promoted to Squadron Leader in January, 1928. In January, 1929, he was posted to the Marine Aircraft Experimental Establishment to command the High Speed Flight.

Flight-Lieutenant D. D'A. A. Greig, D.F.C., A.F.C.

Flight-Lieutenant D. D'A. A. Greig, D.F.C., A.F.C., was born at Elgin, Scotland, in 1900, and was educated by a tutor.

A few days after his eighteenth birthday he joined the Royal Air Force as a Cadet, and was appointed to a commission in June, 1918, and posted to No. 190 Training Squadron. In August, 1918, he was posted to No. 83 Squadron in France. During a patrol he was shot down by an enemy aeroplane. He landed safely twelve miles behind the enemy lines, and he and his observer made a successful escape after walking thirteen miles.

After the Armistice he was posted to No. 1 Stores Depot, and then to No. 3 Training Centre (Boys). In September, 1919, he was appointed to a permanent commission in the R.A.F. with the rank of Flying Officer.

In March, 1920, he was posted to No. 6 (Army Co-operation) Squadron, 'Iraq. In October, 1921, he was awarded the Distinguished Flying Cross for distinguished service in the Field in 'Iraq.

In May, 1923, he was restored to the Home Establishment, and after a course of Air Pilotage at Calshot he was posted to No. 24 (Communication) Squadron. In 1924, he passed a Flying Instructors' course, and was posted to the Central Flying School as Flying Instructor.

Squadron Leader A. H. Orlebar, A.F.C.

Flight Lieutenant D. D'A. A. Greig, D.F.C., A.F.C.

Digitized by Google

In January, 1927, he was promoted to Flight-Lieutenant.

In April, 1927, he was posted to Headquarters Fighting Area for duty as flying examining officer.

In the R.A.F. Display of 1927 he led the aerobatic formation of Genet Moths. In this formation were Flt.-Lt. Stainforth, Flg.-Off. Atcherley, and Flg.-Off. Waghorn.

In April, 1927, he escaped by parachute when an aeroplane he was testing got into an uncontrollable spin.

In May, 1928, he was appointed to the Marine Aircraft Experimental Establishment, Felixstowe, for duty with the High Speed Flight. In June, 1928, he was awarded the Air Force Cross for distinguished flying.

On Nov. 4, 1928, he flew the Supermarine-Napier S.5 at 319.57 m.p.h., thus exceeding the World's Record for speed. The Air Council recorded their high appreciation of the zeal and efficiency displayed by this officer.

Flight-Lieutenant G. H. Stainforth.

Flight-Lieutenant G. H. Stainforth was born at Beckenham in 1899, and was educated at Dulwich and at Weymouth. He went to Sandhurst, and was appointed to a commission in the East Kent Regiment in August, 1918. He served with his Regiment in France in 1918, in India in 1920, in Mesopotamia in 1921, and in Aden in 1922. He retired from the Army in 1922.

In March, 1923, he was appointed to a short-service commission in the Royal Air Force with the rank of Flying Officer, and seniority of March 15 of that year. After a course of flying training at No. 5 Flying Training School, Sealand, he was posted to No. 2 Flying Training School. In April, 1924, he was posted to No. 19 (Fighter) Squadron, and in June, 1924, he was posted to the Central Flying School for a Flying Instructors' Course.

In September, 1925, he was posted to No. 4 Flying Training School, Abu Sueir, Egypt, for duty as a Flying Instructor. During aerobatics practice at Abu Sueir early in 1927 he flew upside-down for 11 min. 42 sec. in an Avro 504K with a 100 h.p. Mono engine.

In March, 1927, he was restored to the Home Establishment, and posted, after a refresher course, to the Central Flying School as a Flying Instructor. In January, 1928, he was promoted Flight-Lieutenant.

In September, 1928, he was posted to the Marine Aircraft Experimental Establishment, Felixstowe, for duty with the High Speed Flight.

Flight-Lieutenant Stainforth is a distinguished marksman. He was a member of the Inter-Services Rifle Match teams in 1923 and 1925, and won the R.A.F. Individual Rifle Championship in 1928, and was second in the R.A.F. Individual Rifle Championship in 1929.

On p. 635 of this issue he appears as having been selected for a permanent commission, "subject to physical fitness."

He was Flg.-Off. Atcherley's passenger in the two-seat Gloster Grebe which won the King's Cup Air Race in July, 1929.

Flying-Officer T. H. Moon.

Flying Officer T. H. Moon, the Technical Officer of the High Speed Flight, was a Chief Petty Officer in the Royal Naval Air Service in 1914—having been previously an Engine-Room Artificer, R.N. He was promoted to Warrant Officer in 1917.

On the formation of the Royal Air Force, in April, 1918, he was appointed 2nd Lieutenant, R.A.F., for Technical Duties. In August, 1919, he was appointed to a permanent commission in the R.A.F. with the rank of Flying Officer.

In May, 1920, he was posted to No. 2, Flying Training School, Royston. In April, 1922, he was posted to Egypt for technical duties at the Aircraft Depot, Abukir. In September, 1923, he was appointed to No. 84 (Bombing) Squadron, Shaibah, 'Iraq, and in January, 1925, he was put in charge of the Inland Water Transport Section at Basrah. In November, 1925, he was again posted to the Aircraft Depot at Abukir.

In June, 1927, he was appointed to the Marine Aircraft Experimental Establishment, Felixstowe, for duty with the High Speed Flight. Flg.-Off. Moon was in charge of the technical side of the organisation of the successful British Schneider Team in 1927.

Flying-Officer R. L. R. Atcherley.

Flying-Officer R. L. R. Atcherley was born at Micklegate, Yorkshire, in 1904, and was educated at Oundle. He entered the Royal Air Force College in 1922. At Cranwell he was appointed Flight-Cadet-Sergeant, and was the winner of the R. M. Groves Memorial Prize for the best all-round pilot in the Senior Term. He was also President of the College Debating Society.

On graduating from Cranwell, he was posted to No. 29 (Fighter) Squadron. In May, 1925, he was posted to the Central Flying School for a Flying Instructors' Course at the end of which he returned to No. 29 (Fighter) Squadron for duty as Flying Instructor.

In October, 1925, he was posted to No. 23 (Fighter) Squadron as Flying Instructor, and in August, 1928, he was appointed Flying Instructor at the Central Flying School.

In October, 1928, he was posted to the Marine Aircraft Experimental Establishment, Felixstowe, for duty with the High Speed Flight.

In July, 1929, he won the King's Cup Air Race in a Gloster Grebe.

Flying Officer R. L. R. Atcherley.

Flying Officer H. R. D. Waghorn.

Flying-Officer H. R. D. Waghorn.

Flying-Officer H. R. D. Waghorn was born in Kensington in 1904, and was educated at Wellington. He entered the Royal Air Force College, Cranwell, in 1922. At Cranwell, he was appointed Flight-Cadet Under-Officer, and was awarded the Sword of Honour. He was *Victor Ludorum*, and represented the College at athletics and at Rugby football.

On graduating from the College, he was posted to No. 17 (Fighter) Squadron. In May, 1926, he was posted to the Central Flying School for a Flying Instructors' Course, at the end of which he was appointed Flying Instructor at the C.F.S.

In February, 1929, he was posted to the Marine Aircraft Experimental Establishment, Felixstowe, for duty with the High Speed Flight.—C. M. MCA.

A PRACTICE MACHINE.—The Avro Avocet seaplane at Calshot, where it has been used for practice by the High Speed Flight. This was the machine which, on the occasion of a visit by a very senior officer of the R.A.F., was decorated, by an enterprising airman, with a daily newspaper poster bearing the words, "British Seaplane's 360 Miles An Hour."—(*"Aeroplane" photograph.*)

THE WEEK AT CALSHOT.

IN TOW.—The second Gloster-Napier VI being towed out to her lighter, which is seen on the extreme left. (*"Aeroplane" photograph.*)

The weather at Calshot has not been kind. Consequently there has been very little flying during the past week, and when the great day comes, the Italian pilots will have had just about as much practice on their speed machines as our team have had.

TUESDAY.

On Aug. 27 the Schneider Committee of the Royal Aero Club definitely decided that whether foreign competitors arrived or not, the British pilots would race over the course.

The curious fact came out that the request for the postponement did not come from the Royal Aero Club of Italy, which was the official entrant for the team, but from the Italian Government itself.

On this day Lord Thomson, the Under-Secretary of State for Air, visited Calshot. He arrived in a Southampton Flying-boat, in which he had flown over the course. He was received by Group Captain E. R. C. Nanson, O.B.E., D.S.C., A.F.C.—O.C. Calshot—and after lunch, inspected all the machines and conversed with the team and Lieutenant Monti, the Italian Assistant Air Attaché.

WEDNESDAY.

On Aug. 28 the announcement was made that the Italian team was coming to England. General Balbo issued to the Press a statement saying (according to *The Times* correspondent in Rome):—

The Italian team is going to England merely to perform a gesture of chivalrous sportsmanship and in order to avoid the appearance that an announcement of withdrawal would have of being a counter-reply to the refusal to postpone the race.

The probability of victory by our team, already hard pressed by the very great delay of the building firms in delivering the machines and the engines, is almost annulled by the death of Captain Motta. His death not only deprives us of our best pilot, but has cost us the engine and the machine which had been perfected for the best speed, and has also meant a week's interruption in our programme.

We thus present ourselves in London with two seaplanes, one of them absolutely new, which has never touched water, and with two perfectly new engines which have so far never been tested in flight. We have to comfort us only the fact that we leave at the hangar at Desenzano two new machines conceived on the boldest plans, on which we place many hopes for the record for speed which we intend to keep in the hands of our country.

Calshot was enlivened by the news, and also by the appearance of an elegant steam-yacht flying the Royal Air Force Ensign. This ship proved to be the *Karen*, lent by Sir Colin Cooper to Air Vice-Marshal C. L. Lambe, C.B., C.M.G., D.S.O., Air Officer Commanding the Coastal Area, to be his flagship during the Schneider period.

THURSDAY.

On Aug. 29 the first instalment of the Italian team arrived, under the command of Lieutenant-Colonel Mario Bernasconi. The other members of the team to arrive were Capt. A. Canaveri, Lieut. Remo Cadringher, Warrant-Officer Tommaso Dal Molin, and Sergt.-Major Francesco Agello.

The smartness of their uniforms and their excellent cut make our R.A.F. people look quite shabby. Another interesting thing about the Italian team is the thoroughly practical type of the waders supplied to the men who handle the machines. They really are proper waterproof suits, whereas our men merely wear waders, and if they are a little over-energetic, the water gets over the top of the

A Country Club for everyone interested in flying.

HANWORTH

THE LONDON AIR PARK and COUNTRY CLUB.

HANWORTH is the ideal flying centre, and is only 30 minutes by road from Hyde Park Corner.

It meets the demand for a well-equipped club where flying is brought into line with the older forms of sport, and the interests of non-flying members are catered for equally with those who indulge in active flying. It is a flying club supplemented by the comforts of a good country club. The amenities include a ball-room, lounges, drawing and writing rooms, dressing rooms, and first-class residential accommodation, besides the provision of tennis and squash rackets courts, and an excellent standard of catering. Wooded gardens and lawns surround the club-house, and the whole estate covers an area of 230 acres, including the two aerodromes of the London Air Park.

The most modern machines of various types are available for instructional and touring flights, and the work of tuition is so organised that members can learn quickly.

Special provision is made for the housing and servicing of privately owned machines.

A limited number of members are being enrolled, to enjoy all the privileges and benefits of the N.F.S. organisation, at the following rates: Flying Members, 5 gns. entrance fee, and 5 gns. annual subscription; Non-flying Members, 3 gns. in each case. For this year two-thirds of the annual subscription is rebated. Serving Officers of H.M. Regular Forces are admitted without entrance fee, and reduced rates are allowed to family members, country members, and overseas members. Membership of the Hanworth Club confers Honorary Membership of all other N.F.S Clubs, and free use of every N.F.S. station.

Qualified flying members will be able to hire two-seater light aeroplanes at rates as low as £1 1 0 an hour (3½d. a mile) from any N.F.S. club. Residential terms at Hanworth range from 5½ gns. to 7 gns. per week.

An illustrated brochure, detailing the services offered to all who wish to fly, will be sent on request.

waders and makes them even wetter than if they operated in bathing-suits.

We still have to discover a better costume than that which the late ever-to-be-lamented Charles Risk invented when he was a Major of Marines commanding the Felixstowe Naval Air Station. The costume consisted simply of a white jumper and thick blue serge shorts.

FRIDAY.

On Aug. 30 our late excellent Under-Secretary of State for Air, Sir Philip Sassoon, now Chairman of the Royal Aero Club, visited Calshot, as did Air Commodore F. W. Bowhill, C.M.G., D.S.O., Director of Organisation and Staff Duties at the Air Ministry, and Air Vice-Marshal Sir Sefton Brancker.

On this day there was a certain amount of flying. The first of the Supermarine-Rolls-Royce S.6's, N-247, which had come back from the works with a new engine and extra radiators fixed on the floats, was taken up by Mr. Atcherley. These additional radiators are like metal plates stuck along each side of the floats.

This question of cooling seems to have been giving a little trouble, in spite of the ingenious arrangement of the wing radiators. At first the idea was that the outer surfaces of the wings alone would give cooling enough. Then air was forced to the inside of the wing by fitting three little scoops, each of which looks like half a cup, along the lower surface of each wing-tip.

Somebody asked Mr. Mitchell, the designer of the Supermarine, what these cups were for. He explained carefully that they were there so that when the pilot did a good landing he got his money back. They do, in fact, look exactly like those little cups on automatic machines from which one extracts the money for the cigarettes which are not there.

Late in the day the first of the Gloster-Napier VI's was taken for an airing. The engine had been tuned up on the station and seemed to have got over its fits of choking, caused by something unknown, which in this country we call peculiarities of installation, but in America they call plainly plumbing troubles.

It was taken out on an R.A.F. pontoon, but after hanging about for an hour the light went down and the wind did not, so it returned home.

The Italian team were taken round the course in a Southampton Flying-boat during the day. Lieut.-Col. Bernasconi, the commanding officer, announced that his pilots approved the course, and particularly liked the pylons at the turning points. These pylons are, in fact, noticeable edifices, built on top of destroyers, which have been lent by the Admiralty for the purpose.

MAN-HANDLED.—The second Supermarine-Rolls-Royce S.6 being pulled up the slip-way at Calshot after being towed from the Supermarine Works by a motor-boat.

But, apparently, the Italians seemed worried by the amount of casual shipping strolling about the Solent, which they very rightly said would make practice difficult. As a matter of fact, our pilots find the same trouble, only we live in a limited monarchy, whereas our Italian friends live in an unlimited dictatorship. No doubt if any wretched boat got in the way of an Italian practice machine on Lake Garda it was either sunk by gun-fire, or the skipper was sent to one of Signor Mussolini's homes for misguided patriots in the Lipari Isles.

Signor Balbo, the Italian Air Minister, or, more correctly, Under-Secretary of State for Air to Signor Mussolini, who himself is Minister for the Army, Navy, and Air Force, arrived at Folkestone on the evening of Aug. 30, where with his staff he was met by the Italian Air Attaché in London and by Group Captain C. E. H. Rathborne, D.S.O., R.A.F., on behalf of the Air Ministry.

Late at night the special train conveying the equipment of the Italian team arrived at Harwich. The whole train had been brought over by the train-ferry from Zeebrugge. It consisted of 14 large covered wagons.

A working party of about sixty engineers of the Italian Air Force and of the constructing firms also arrived at Harwich.

SATURDAY.

On Aug. 31 the second of the Gloster seaplanes, N-250, made the first real flight done by the Glosters. As usual, it was tested by Sq.-Ldr. Orlebar before letting any of the junior pilots have anything to say to it.

This principle of testing all the machines himself for the first time is one in which Sq.-Ldr. Orlebar has very sensibly followed the custom of Sq.-Ldr. Slatter, who commanded the 1927 team. One scarcely expects a war-time officer with the rank of Squadron-Leader to be a high-class pilot

OVERTIME.—Night work on the Supermarine-Rolls-Royce S.6 during the weeks preceding the Schneider Trophy Contest. On the right is Mr. R. J. Mitchell, the designer of the machine.

PRACTICE.—The Avro Avocet being taxied out for a practice flight.—(*"Aeroplane" photograph.*)

of racing machines, but in principle a commanding officer ought to be able to fly anything which his subordinates have to fly.

A Squadron-Leader ranks with, but after, a Major in the Army, and one scarcely expects a Cavalry Major to be a first-class broncho-buster, or even to be the best rough-rider in his regiment. Squadron-Leaders in the Air Force are as a rule younger men than Majors in the Army or Lieutenant-Commanders, R.N., but, even so, there are a good many who would scarcely care to tackle flying Schneider speed machines.

To Sq.-Ldr. Orlebar the game is mere child's play, for he was a test pilot at Martlesham away back in 1922, and a Schneider machine, built with all the knowledge which is behind it, is probably a safer mount in its first flight than many of the comic products of brain-storm designers which Sq.-Ldr. Orlebar has tested in the past.

The Gloster-Napier was in the air about 8½ minutes. It certainly seemed to be very fast.

Later, Mr. Waghorn took out the Supermarine, but failed to get it off the water. After several attempts the machine was seen to have a heavy list to one side, and looked like sinking, so it was brought back to the Station, where about 30 gallons of water were emptied out of one of the floats. Investigation showed that a leak had been formed because certain rubber washers which ought to have gone underneath the fittings which carry the wires and struts through to the interior structure of the floats had been forgotten. Thus do mistakes happen even in the best-regulated families. However, nothing serious happened, and the machine was all tee-ed up ready for a trial next day.

SUNDAY.

Sunday, Sept. 1, seemed to be a regular visiting day at the Station. Among those present, as it were, one noticed Lieut.-Col. Moore-Brabazon, late M.P., but ever a pioneer aviator; Sir Henry Segrave, who admitted that he had come to see what real speed was like; Mr. T. O. M. Sopwith, also a pioneer aviator, and now the owner of one of the finest steam-yachts afloat, and of a crack sailing-yacht; and quite a number of the more or less senior R.A.F. officers, many of whom one had not seen for years. Most of the senior R.A.F. officers within reach seemed to be giving themselves a holiday at Calshot on Sunday.

One particularly interested, and interesting, visitor was Lieut.-Col. Spenser D. A. Grey, D.S.O., who built the original Calshot Air Station, and was its first Commanding Officer. Until that day he had not been on the Station which he founded from the day when he relinquished his first command there. He broke his back in a crash not very long before the War, but the doctors failed to discover the breakage. He flew right through the War, and for a year or so afterwards, his back getting steadily worse and worse, and he was compelled to resign from the R.A.F. Since then he has been very much of a cripple, but, his many friends will be glad to hear, he has improved considerably during the last twelve months.

The only Italian machine which looked like taking the water during the day was the old original machine which was flown at Venice. One of the Sunday papers said that this machine had been described by the Italian Air Attaché as "the Nigger of Venice," because it had got so dirty through much flying. As a matter of fact, the Italian Attaché was really making quite a neat little joke on the late lamented Othello, and intended to call the machine "The Moor of Venice."

Although the visitors naturally and duly admired the beauties of the two Gloster-Napiers, and of the Supermarine-Rolls-Royce S.6 N-247 (which was the first machine

of the four to be delivered, and is now almost regarded as a veteran because it has been flown so much), interest, or at any rate, curiosity, centred very largely on the Italian machines. The practice machine, of the 1927 type, as already said, was out on the slipway. The two new Macchi 67's were kept shut up in their shed. But in the next-door shed the little Fiat and the tandem-engined Savoia-Marchetta, were being put together.

THE SMALL FIAT.

The Fiat strikes one at first as a perfect death-trap. When the pilot gets in, a kind of little helmet is shut down on his head, and there seems no possible way for him to get out. As a matter of fact, that does not really matter, because if anything happens to any of the machines (either ours or the Italians') at the speed at which they fly, there is no hope for anybody at all. And as none of the pilots carry parachutes, because there is no room for them, there is not even the hope of doing what the American Army pilots had orders to do in the Pulitzer Trophy Race some years ago, namely, to pull the machine up in a zoom, and then step out with a parachute, and chance where the machine came down.

What really strikes one as being the matter with the Fiat is that she is very much too short for her power. Although the projected frontal area of the engine is very small, the fuselage is smaller still, and it strikes one as being too short to allow the eddies from the cylinder-blocks and the slip-stream to straighten themselves out before they get to the rudder and elevator. Also, like most Italian machines, the Fiat has a cruciform tail-unit—meaning that there is a rudder and fin above and below the fuselage just as there is an elevator and tail-plane on each side. This looks very pretty, and it may be excellent in a wind tunnel with a perfectly straight breeze blowing over the fuselage. But pilots who have flown machines with this cruciform tail say that they are very apt to be directionally unstable, and very tricky to fly because of the whirling slip-stream of the airscrew.

THE OFFICIAL LAUNCHING COSTUME.—Three members of the Italian handling crew.

Digitized by Google

THE "MOOR OF VENICE."—One of the Macchi M-52 monoplanes used for practice purposes by the Italian team.—(*"Aeroplane" photograph.*)

THE HIGH-SPEED EFFORT.

The Savoia-Marchetti is quite an interesting animal. The tandem engine arrangement, with the pilot stuck in between, is precisely as suggested by Herr Dornier some years ago. But instead of continuing the heels of the floats up to carry the tail-unit, as Herr Dornier proposed doing, in this machine the tail-unit is carried simply on two very strong rectangular-section tail-booms—very much as Mr. Koolhoven fitted the tail-unit on the Bat Crow, which he built shortly after the War as a superlatively light light-aeroplane. There is no reason why the arrangement should not work just as well on a very powerful machine.

The general idea of the pilots at Calshot seemed to be that this machine would be terrifically fast on the straight, but would be almost impossible to handle round corners. The notion seems to be that after the Schneider Contest is over this machine may be brought out to go for the speed record over the measured three-kilometre course.

SPEED TIMING.

Apropos the speed course, still nobody seems to know how the timing is going to be done. There is a great deal of talk about a cable which has been laid over three kilometres of the Solent, though some people say it is along Southampton Water. This cable is supposed to give absolute synchronisation between two stop-watches, or two cinematograph apparatuses, one at each end.

It may do all that, and yet there may be a horrible personal error because of the delay caused by the nerve-reactions of the time-keeper who has to start and stop the apparatus at each end. There is just as likely to be an error between eye and hand in this way as there is between two first-class synchronised watches each worked by a first-class timekeeper. There is, however, talk of synchronised camera guns, and also of a photographic cinematograph camera.

THE ITALIAN CHOICE.

For the Schneider Contest, the Italians seem to be relying on their two Macchi 67's, with the new Isotta-Fraschini engine, which is alleged to give anything between 1,000 and 1,500 h.p., and as the tail of the team the old record-breaking Macchi 52bis on which Major Bernardi put up the existing World's Speed Record.

A good deal is being made in some papers of the fact that the engines in the Macchis have never been run up. This seems extraordinarily unlikely. One can scarcely imagine the Isotta-Fraschini firm, who are known to have built a quantity of engines for these machines, sending one out in an aeroplane when it has never done its full-power test. The Italians have, in fact, built far more engines for this contest than we have done. The Isotta people alone are said to have built 27 engines, and the Fiat Company have probably built pretty nearly as many.

Schneider Winner CELLON products

Sqdn. Ldr. A. H. Orlebar, A.F.C., O.C. of the High Speed Flight in the cockpit of the Supermarine Rolls-Royce "S.6." Sqdn. Ldr. Orlebar carried out the first trial flight himself on August 10th, 1929.

Since the early days of Aviation CELLON have always been to the forefront in all the reliability trials and high speed contests where extreme durability and superfine finish have been the aim of the constructors. Despite the rapid development indicated by comparison of speeds over the past few years, CELLON have kept the pace and not only supply the famous Cellon Dope for fabric but also suitable Lacquer Finish for any other form of construction. It is interesting to note in this connection that both Messrs. Rolls Royce Ltd., and Messrs. D. Napier & Sons use Cerric Black Lacquers as a finish for their aero engines.

Thus, since 1914 the principal constructors have invariably used Cellon products for their Schneider Trophy machines. Every British machine that has won the Schneider Trophy has been Cellon finished.

Every British entry this year is finished with the products of CELLON LTD., who wish the pilots every success.

IN FLYING KIT.—From left to right: Sergt. Agello, Capt. Canaveri and Warrant Officer dal Molin.
("Aeroplane" photograph.)

A Matter of Engines.

As a matter of fact, we might just as well say that our racing engines, which are said to give about 1,900 h.p., with the super-chargers in full blast, have not yet been run up in the machines. There is no intention that they should be.

The Supermarine—Rolls-Royce N-247, which was the first machine delivered, did about four hours' flying, and then a new engine was put in with which this week's practice will be done.

Supermarine—Rolls-Royce N-248 having been flown and found to fly all right, has already been sent back to the factory to have her racing engine put in. And a similar racing engine will be put into 247, probably the day before the contest, which means Thursday of this week. But neither of those two engines will be flown until the machines are put in for the qualifying tests on Friday morning.

The Glosters will also have their practice engines, and their actual racing engines put in before Friday, whether they are both flown or not. And those four racing engines will only have one short test in the air before flying in the competition.

A Matter of Pilots.

Naturally, there is a good deal of talk as to which three British pilots of the five who constitute the team will represent Great Britain on Friday and Saturday

As unfortunately, owing to late deliveries of the machines and/or engines, there has been no chance of trying all five pilots on all four machines, so as to discover definitely whether one pilot likes one machine better than the other, or whether any one pilot or any one machine of any one type or any one engine is better than any other, the whole thing has become simply a lottery.

Sq. Ldr. Orlebar has flown all the machines, but the assumption is that the Commanding Officer will not actually fly in the competition. Mr. Atcherley and Mr. Waghorn happen to have had more flying in the Supermarines than have Flt. Lt. Stainforth and Flt. Lt. D'Arcy Greig.

That has been purely a matter of luck in that though they have all taken the Supermarines out, the two first-named have had more luck with the weather and have been able to get the machine off the water. Consequently Flt. Lt. Stainforth and Flt. Lt. Greig have been allocated to the two Glosters.

Such is the luck of this game that quite conceivably in the last three days before the engine-changing process on Thursday the Glosters may get in more flying than the Supermarines have had

The point really is that there ought not to have been all this delay in delivery. Year after year the same thing happens. We fix the date of a competition. Everybody has months' or years' notice of the date. Then they allow that so many days' practice will be necessary before the competition, and frame a programme for delivery just so long before. And either something goes wrong in the works or something goes wrong with the health of the personnel or something goes wrong with the weather, and we find ourselves putting the finishing touches to the machines on the starting line as usual.

Our only consolation is that other countries are just as bad. Otherwise the Italians would have been over here a month ago with about ten thoroughly tested and tried-out machines.

Sunday's Flying.

On Sunday last we all stood around waiting for something to happen, for although there were no white-caps out on the Solent as there were on the first Monday, August 19, when we all went to see the machines for the first time and Sq. Ldr. Orlebar took up the first Supermarine, in spite of the waves, there was, one was told, quite a nasty swell out in the open, although it looked liked a fairly flat sea with a nice little ripple on the top to help the floats off, and a fine lifting breeze to help lift the wings.

For these high-speed machines a swell coming in from the Channel is far worse than a short choppy sea. The floats can batter their way through a short sea, but a swell leads to porpoising and all sorts of troubles, and dangers. One pilot said that actually these floats took the water more softly than do the flat floats of the Flycatcher which is used for practice.

Wanted,—an Airscrew.

The worst trouble of these very high-speed machines is that they take such a long time to get off. And there is no cure for this trouble until somebody produces a variable-pitch airscrew which is strong enough and reliable enough.

At approximately six miles a minute the speed of the machines through the air is about 520 feet a second. Supposing that the airscrew is doing 1,800 r.p.m., then it is doing 30 revolutions per second, which means that it is progressing forward 17 feet, as near as no matter, per revolution. And you cannot take an airscrew which is intended to go forward 17 feet per revolution and expect it to push efficiently when it is going no feet per revolution, or only going a mere 5 or 6 feet of forward progress per revolution,—which is about what it is doing when the machine is somewhere near its taking-off speed.

The fact is that the most effective part of the airscrew blade is hopelessly stalled while the machine is working up from 0 m.p.h. to about 90 m.p.h. And it only begins to get in any of its fine work at about 250 m.p.h. So the mere fact that a machine takes a long time to get off may con-

TWO'S COMPANY.—Two Macchi M-52 practice machines on their big lighter.—(*"Aeroplane" photograph.*)

ceivably prove that it is very much faster than any of the others when it does get into the air.

But for these long runs the water must be reasonably flat, though it is better if it is not smooth. And meantime the Fairey-Reed duralumin airscrews are doing their job wonderfully well.

Despite all these minor worries and all this waiting for a chance of getting off, all of which are calculated to get on anybody's nerves and make them jumpy and bad-tempered, the British Team seem to take everything just as calmly as if they were doing ordinary duty in a squadron. And they keep themselves very fit with various forms of exercise, particularly swimming.

Incidentally, a week or two ago one of the officers, who is apt to be a bit absent-minded at times, was walking along the diving plank, and for some reason took it into his head to dive before he got to the end of it, without considering whereabouts the tide was. The result was that he dived into a couple of feet of water and cut the top of his head quite badly. But barring a bit of plaster on his head it seemed to do him no harm.

A MEMORABLE SIGHT.

Late on Sunday night when a good many of the visitors had gone and heavy, stormy-looking clouds were banking up from the south-west, the Supermarine 247 with Mr. Waghorn as pilot went out in its float to the far side of the Solent and hung around for a long time waiting for the swell to flatten still more.

Then Sq. Ldr. Orlebar and a couple of other officers in a speed boat went out to see what was happening and found that conditions were improving considerably. So they hurried back, and Sq. Ldr. Orlebar went out again with the Gloster 250 in another float.

The shades of night were falling uncomfortably fast when a patch of white in the far distance showed that the Supermarine was trying to get off in the usual cloud of spray. Mr. Waghorn made four or five shots at it before the machine lifted, but when he did get away there was no doubt about the speed. Some of the knowing people said that it was the fastest bit of flying that had ever been done. But in that half-light speed is apt to be deceptive.

Shortly afterwards the Gloster also got up and careered around apparently quite amiably under control.

The amazing thing was that anybody should dare to take any kind of a high-speed machine up in such a shocking light, with the prospect of getting it down again. Going up Southampton Water the glow of the set sun must have been

ITALIAN PRACTICE.—A Macchi M-52 afloat at Calshot.—(*"Aeroplane" photograph.*)

in the pilot's eyes, and coming down again he was going into darkness with heavy clouds closing in on the west.

However, both machines got down all right, much to the relief of the onlookers. And those who saw those tiny machines streaking along the sky against the background of angry cloud and falling night, will long remember the sight.

MONDAY.

For Monday's doings THE AEROPLANE has to depend on the excellent report in *The Times*, and a little local gossip, as the Staff of THE AEROPLANE were busy getting this issue of THE AEROPLANE ready and could not be at Calshot. Mr. Colebrook's reports are invariably accurate, and he never misses anything that is essential, so that this information may be taken as authentic.

Apparently the chief excitement of the day happened when Mr. Atcherley, who had taken up the Supermarine-Rolls-Royce N-247 came in with the duralumin fairing of one of his float-struts badly torn. Mr. Atcherley reported that he had intended to fly for half an hour, but after ten minutes he felt that there was something wrong with the feel of the machine so he came down. When the machine got back to Calshot the fairing of the strut was found to be broken, and, what was more curious, the pieces of the fairing left were "fused at the edges much as lead-foil crumbles in the flame of a match."

The experts assumed that the friction of the broken metal parts rubbing each other in the blast from the airscrew was such as actually to burn the metal. At one point the petrol pipe from the tank in the float up to the engine was bent.

The general assumption was that the machine must have hit a sea-gull while flying. This seems quite probable. Gulls are slow flyers and anyhow the gulls over the Solent are so accustomed to slow flying-boats and such things that they have not yet awakened to the fact that they have to get well out of the way before one of these 350 mile-an-hour projectiles comes along.

No doubt if Schneider practice continued long enough the gulls would learn to obey the Air Ministry's temporary Air Navigation Regulations, and would sit on the water so long as the white cross was displayed at Calshot.

Mr. Colebrook points out very rightly that a collision with a gull might sometimes be as dangerous to the seaplane as to the bird. Ripped cowling or a crumpled wing-tip might throw the machine right out of control.

In another paper there is a report that on examination the damaged strut was found to be covered with blood. This might point to the pilot having been in close proximity to Ryde, in which case possibly the intense vacuum caused by the front of the machine might have caused hæmorrhage from some of the over-charged blood-sucking inhabitants.

The worst part of the incident is that the machine cannot be used for further flying till a new fairing has been made, and the other Supermarine is still having her racing engine fitted. But, as Mr. Colebrook points out, fortunately the experts have now nearly all the data they want about the Supermarines' performance, so while the new fairing is being made the racing engine is being fitted. When the two Supermarines are back each will have one short test flight just to make sure that the engine is all right and then they will be put away till Friday for the qualifying tests.

After Mr. Atcherley's incident Flt. Lt. D'Arcy Greig took out one of the Gloster-Napier VIs for the first time. He flew for about ten minutes, and those present when he came back understood that he was quite satisfied with the performance of the machine.

Another mild alarm happened, when Tomaso dal Molin the Italian Warrant-Officer pilot, took up one of the Macchi practice machines. As he got into the air the onlookers saw water pouring out of one float, and jumped to the conclusion that in getting off he must have hit some obstacle which had punctured the float. The pilot seemed quite happy and flew around over the course while all the speed-boats and other means of water transport set out for places where he would be likely to alight, ready to rescue him when the machine sank if it were lucky enough to make a safe landing with its damaged float.

TUNING UP.—The Macchi 67 monoplane (18-cylinder Isotta-Fraschini engine) built for this year's contest. The fine lines of the fuselage can be compared with those of the machine above.—(*"Aeroplane" photograph.*)

Digitized by Google

The Italian and British medical officers with stretchers in their boats went out along with the rest, and those who could not find places in boats sat on the shore and waited anxiously. After he thought he had done enough flying Signor dal Molin alighted, rather bumpily one report says, and remained floating placidly.

One of those present says that while the machine was standing on the slipway he noticed that there was a hole in the top of the float, where apparently a towing-cleat or some other attachment had been torn out. He says also that he saw two or three of the Italian mechanics looking at it. But seemingly nothing was done. The hole was above the water-line but evidently let water in when the machine was ploughing along before getting off, or when the nose dipped under water as she slid off the floats.

The Italian engineers finished assembling one of the new Macchis during the day and the engine was given a run, but according to *The Times* the engine did not give full revolutions and was to be changed.

Later the little Fiat seaplane was brought out and its engine was run up in the dark. Mr. Colebrook is not given to fine writing, but his short description of the performance is worth reproducing.

Later the little Fiat seaplane, the smallest made speed aircraft of its power in the world, was brought out, and in the darkness of the night its 1,000 horse-power engine was run up until the spectators plugged their ears to deaden the roar. Anchored down to the concrete, its exhaust ports glowed blood-red at full throttle, and bursts of blue flame were blown out by the rush of air from the airscrew as the engine sang its full song at the greatest number of revolutions. Through the tiny conning-tower a white light shone as the engine tuner flashed a torch on his instruments, mechanics clung to the floats to steady the tiny body still more, and the scene suggested the fantasy of worshippers at the shrine of the God of Power terrified by their own deity.

FINAL HINTS.

In conclusion one would point out that actually the weather on Friday matters a great deal more than does the weather on Saturday. On Friday the machines have to do their Airworthiness and Seaworthiness Tests.

These tests, which may be made at any of four or five places on the Solent, according to the wind and weather, are arranged thus:—Each machine must taxi over a starting line,—which is not likely to be fixed till the morning of the tests. Then the machine must get off the water and continue over a marked course which must measure between five and ten nautical miles. While on this course it must alight twice and taxi over two distances, each half a nautical mile in length, duly marked by buoys, at a minimum speed of 12 knots. After flying over the remainder of the course the aircraft must alight again and taxi over the finishing line.

The official Stewards of the Meeting, or Commissaires, or Kommisars, may allow competitors who have been unsuccessful in the test to make a second and last attempt.

After completing these tests the machines must be moored out immediately to a buoy where they must remain afloat for six hours without anybody on board.

No repairs may be made during these tests, and no modification may be made to the machines between the completion of these tests and the contest itself. Changes of airscrews and certain engine parts are allowed.

This does at any rate give the competitors a chance of putting on low-pitch airscrews which will help the machines to get off and taxi comparatively easily and will still give them reasonable flying speed of say a mere 200 m.p.h.

Thus readers may see that unless the weather is good on Friday there is no hope of getting these machines through a test which involves four lots of taxying and getting three times into the air all in one series of operations.

On the day of the contest itself, when the machines only have to get off the water once and then get down somehow without smashing themselves, no matter what the weather may be there is always a possibility of finding a piece of water either in Southampton Water itself or in a sheltered part of the Solent from which the machines can get off.

Those who have read so far through all this matter concerning the Schneider Trophy Contest will realise that from any common-sense point of view the whole thing is nonsense. The idea that it is in these days any help to the development of seaplanes might just as well be washed out straight away. And with it should go all these so-called navigating and seaworthiness tests.

We may as well recognise in future that the whole thing is purely and simply a speed test and that all we need to do is to produce machines which will get off the water once and get down again.

Failing that, the whole scheme of the contest ought to be altered and the machines should be tied down to a certain definite speed of alighting. This would indeed help the progress of aviation, because when designers had to turn their attention to giving a really slow alighting speed, which would mean a low stalling speed, combined with enormously high flying speed, then they would have to use other portions of their brains besides those which produce personally-conducted projectiles.—C. G. G.

WE'RE HERE.—The Italian team arrives.—Left to right: Lt. Cadringher, Lt. Monti, Lt.-Col. Bernasconi, Warrant Officer dal Molin, and Sergt Agello.

THE ITALIAN OFFICERS.—Left and right:—

LIEUTENANT-COLONEL (ENGINEER) MARIO BERNASCONI (wing commander), aged 36, Chevalier of Saint Michael and Lazarus, Chevalier de la Couronne d'Italie, the Croix de Guerre. He is a Piedmontese. He entered the War an engineer officer, and in 1916 became a pilot. Later he was appointed an instructor at military flying training schools, and subsequently commanded two fighter schools. After the War he remained at the research and experimental station of Monte Celio, near Rome. Then in December, 1927, he was selected as Commanding Officer.

TENENTE (FLYING OFFICER) GIOVANNI MONTI, aged 29, has been a pilot since 1918. After the War he left the Service, but on the formation of the Royal Italian Air Force in 1922 he rejoined as a pilot in D'Annunzio's old squadron "Serenissima." In 1924, 1925, and 1926, he was in a squadron in Cirenaica. He has the bronze medal for valour, the Croix de Guerre, and colonial decorations.

TENENTE (FLYING OFFICER) REMO CADRINGHER, aged 27. He has been a pilot since 1924 in fighter squadrons.

CAPTAIN A. CANAVERI, the reserve pilot, who was prevented by sickness from qualifying for the special high-speed badge, is 31, and was born at Bologna. He has been a pilot since 1918 on sea and land machines both for reconnaissance and for army co-operation, eventually becoming a fighter pilot. After serving in the War he took part in campaigns in Libya. He is a Chevalier de la Couronne d'Italie and has the Military Cross for Valour and two Croix de Guerre.

The London Gazette.

August 27.

ROYAL AIR FORCE.

GENERAL DUTIES BRANCH.—The following flight cadets having successfully passed through the R.A.F. College, Cranwell, are granted perm. comns. as Plt. Offs. with effect from and with seniority of July 27:—D. W. Lane, G. G. Barrett, J. A. Powell, R. L. Phillips, F. C. Cole, R. C. Keary, K. W. Niblett, S. S. Murray, K. P. Lewis, E. R. Simonds, L. Croker, R. E. de T. Vintras, G. K. Fairtlough, M. L. Heath, W. S. Hebden, W. V. L. Spendlove, I. B. Newbigging, F. W. Stannard, F. R. Drew, W. T. F. Wightman, W. I. H. Burke, E. J. Corbally, H. R. L. Hood, A. D. Selway, C. A. Watt, L. E. J. Lucas, A. O. Molesworth, R. C. Mead, F. A. J. Pollock-Gore, D. J. Douthwaite, Lord Malcolm A. Douglas-Hamilton.

G. V. Carey is granted a S.S. comn. as a Flg. Off. with effect from and with seniority of Aug. 6. The following are granted S.S. comns. as Plt. Offs. on probation with effect from and with seniority of Aug. 15:—R. B. Abraham, M. J. Adam, A. C. Bailey, J. L. C. Banks, D. Barclay, D. Carr, R. J. Cohen, N. Kirkham, A. N. Luxmoore, J. E. C. McClure, R. M. Noblston, A. W. B. Page, M. E. Pickford, W. J. Scott, W. B. J. Sharp, G. E. B. Stoney, G. R. Stroud, L. Watson, R. L. West, A. M. Wood. The following are granted S.S. comns. as Plt. Offs. on probation with effect from Aug. 16, and with seniority of Aug. 15:—J. C. Atkins, E. Poole.

Lt. F. M. R. Stephenson, R.N., is re-attached to the R.A.F. as a Flg. Off. with effect from Aug. 3 and with seniority of July 14, 1924. Lt. R. G. Poole, R.N., is re-attached to the R.A.F. as a Flg. Off. with effect from Aug. 14 and with seniority of June 16, 1924.

The following Plt. Offs. on probation are confirmed in rank:—J. R. Ayling (Aug. 15); W. S. C. Adams, R. A. Beynon, E. J. Brighton, D. A. Craik, E. B. Grace, R. Jones, G. R. Montgomery, M. G. Parker, S. P. Richards (Aug. 24).

Group Capt. P. L. W. Herbert, C.M.G., C.B.E., is placed on the half-pay list, scale A (Aug. 25).

The S.S. comn. of Plt. Off. on probation J. Lewis is terminated on cessation of duty (Aug. 28).

MEDICAL BRANCH.—Flt. Lt. G. H. H. Maxwell, M.B., is promoted to the rank of Sq. Ldr. (Aug. 22).

RESERVE OF AIR FORCE OFFICERS.

GENERAL DUTIES BRANCH.—The following are granted comns. in the Special Reserve as Plt. Offs. on probation:—M. M. Hutchinson (June 21); F. W. Hartridge (June 29).

The following Plt. Offs. on probation are confirmed in rank:—J. T. S. Horsfall (Aug. 22); G. C. Holland (Aug. 27). Flg. Off. E. F. Smith is transferred from Class C to Class AA (1) (Aug. 14). Flg. Off. C. U. G. Tristram is transferred from Class A to Class C (July 4). Flg. Off. G. V. Carey relinquishes his comn. on appointment to a S.S. comn. in the R.A.F. (Aug. 6).

Appointments.

Week ending Sept. 2.

GENERAL DUTIES BRANCH.—Wing Commanders R. G. D. Small, to H.Q., Fighting Area, Uxbridge, for Air Staff duties, 16/9. J. H. Herring, D.S.O., M.C., to H.Q., Inland Area, for Personnel Staff duties, 6/8. W. S. Douglas, M.C., D.F.C., to H.Q., Middle East, for Air Staff duties, 16/8.

Squadron Leaders E. J. Cuckney, D.S.C., to School of T.T. (Men), Manston, 20/8. M. F. Browne, to No. 1 F.T.S., Netheravon, 9/8. G. W. Bentley, D.F.C., to H.Q., Coastal Area, 9/8. C. W. Mackey, to R.A.F. Training Base, Leuchars, 12/8. E. L. P. Morgan, to H.Q., A.D.G.B., 15/8. C. Boumphrey, D.F.C., to H.M.S. *Hermes*, 11/8.

Flight Lieutenants G. O. Venn, to H.Q., A.D.G.B., 2/8. S. L. Quine, M.C., to School of Army Co-operation, No. 16 (A.C.) Sqdn., Old Sarum, 20/9. A. M. Wray, M.C., D.F.C., A.F.C., to No. 3 F.T.S., Grantham, 2/8. F. G. Jennings, to H.Q., Coastal Area, 1/8. A. L. R. Duke, to No. 3 F.T.S., Grantham, 17/8. D. W. F. Bonham-Carter, to H.Q., Wessex Bombing Area, Andover, 12/8. R. L. McK. Barbour, D.F.C., A.F.C., to A.A.E.E., Woodbridge, Suffolk, 12/8.

Flying Officers T. O'N. East, to R.A.F. Practice Camp, Catfoss, 21/8. C. Dickson, to Armament and Gunnery School, Eastchurch, 30/8.

Pilot Officers R. A. Beynon and M. G. Parker, to No. 2 (A.C.), Sqdn., Manston, 14/8. S. P. Richards, to No. 4 (A.C.) Sqdn., S. Farnborough, 14/8. R. Jones, to No. 13 (A.C.) Sqdn., Andover, 14/8. W. S. C. Adams, E. B. Grace and M. V. Delap, to School of Naval Co-operation, Lee-on-Solent, 14/8. D. A. Craik, to No. 58 (B) Sqdn., Worthy Down, 14/8. G. R. Montgomery, to No. 502 (Ulster) (B) Sqdn., Aldergrove, 14/8. G. D. Hoyland, to No. 26 (A.C.) Sqdn., Catterick, 14/8. S. S. Mackay, to No. 35 (B) Sqdn., Bircham Newton, 14/8. R. E. Watts, to Aircraft Depot, India, 10/7. T. W. G. Eady, to No. 28 (A.C.) Sqdn., India, 10/7. E. Rotheram, to No. 20 (A.C.) Sqdn., India, 10/7. The following Pilot Officers are posted to R.A.F. Depot, Uxbridge, on appointment to S.S. Comns. (on probation):—Ralph Bagshaw Abraham, Maurice James Adam, Adam Carter Bailey, John Langton Courtenay Banks, David Barclay, David Carr, Ronald Joseph Cohen, Norris Kirkham, Arthur Noble Luxmoore, John Evelyn Crosland McClure, Reuben Michael Noblston, Arthur Wilfred Brian Page, Maurice Edward Pickford, William Joseph Scott, William Bernard John Sharp, George Edward Bowes Stoney, Graham Robertson Stroud, Leslie Watson, Ralph Leonard West, Allan Morton Wood, 15/8. John Croft Atkins, Edward Poole, 16/8. The undermentioned Pilot Officers are posted on appointment to Perm. Comns. from the R.A.F. College, with effect from 27/7:—D. W. Lane, to No. 13 (A.C.) Sqdn., Andover. G. G. Barrett, L. Crocker, F. R. Drew, W. I. H. Burke, to R.A.F. Base, Calshot. J. A. Powell, G. K. Fairtlough, to No. 56 (F) Sqdn., North Weald. R. L. Phillips, F. W. Stannard, to No. 2 (A.C.) Sqdn., Manston. F. C. Cole, C. A. Watt, L. E. J. Lucas, D. J. Douthwaite, to No. 17 (F) Sqdn., Upavon. R. C. Keary, A. O. Molesworth, to No 25 (F) Sqdn., Hawkinge. K. W. Niblett, to No. 100 (B) Sqdn., Bicester. S. S. Murray, M. L. Heath, W. S. Hebden, to No. 16 (A.C.) Sqdn., Old Sarum. K. P. Lewis, R. C. Mead, to No. 26 (A.C.) Sqdn., Catterick. E. R. Simonds, to No. 43 (F) Sqdn., Tangmere. R. E. de T. Vintras, I. B. Newbigging, to No. 33 (B) Sqdn., Netheravon. W. V. L. Spendlove, Lord M. A. Douglas-Hamilton, to No. 3 (F) Sqdn., Upavon. W. T. F. Wightman, E. J. Corbally, A. D. Selway, to No. 1 (F) Sqdn., Tangmere. H. R. L. Hood, to No. 23 (F) Sqdn., Kenley. F. A. J. Pollock-Gore, to No. 35 (B) Sqdn., Bircham Newton.

MEDICAL BRANCH.—Flight Lieutenants J. P. Hederman, to Station H.Q., Hendon, 16/9. G. P. O'Connell, M.B., to H.Q., R.A.F., India, 16/8. B. Fitz-James Haythornthwaite, M.B., to A. and G. School Eastchurch, 18/9. L. I. Hyder, to R.A.F. Depot, 30/8. L. C. Palmer-Jones, M.B., to R.A.F. Base, Malta, 5/8.

Flying Officer L. O'Connor, to No. 26 (A.C.) Sqdn., Catterick, 27/8.

STORES BRANCH.—Flight Lieutenant S. D. Dennis, to No. 5 F.T.S., Sealand, 17/8.

Flying Officers D. G. McDiarmid, to No. 2 Stores (Ammunition) Depot, Altrincham, 17/8. C. S. Whellock, to Station H.Q., Upper Heyford, 17/8. C. B. Horsfield, to H.Q., Inland Area, 19/9.

ACCOUNTANT BRANCH.—Flight Lieutenant H. W. Carpenter, to Station H.Q., North Weald, 12/8.

TRIALS.—R.M.S. "Mauretania" doing her best to wash away the Supermarine-Rolls-Royce S.6 just in front of her bows, and the Gloster-Napier VI on the slipway.—(*"Aeroplane" photograph.*)

The Riots in Palestine.

The following statement was issued by the Colonial Office on Aug. 27:—

General Situation.—The situation is reported as well in hand, all being quiet in Jerusalem and Jaffa, where up to the present most of the rioting has taken place. The country outside these centres is, however, still unsettled, continuous organised attacks being carried out by Arabs on numerous scattered Jewish colonies. There have been no attempts so far at interfering with essential services.

The following reinforcements have either arrived in Palestine or are on their way from Egypt and Malta:—

H.M. ships *Sussex, Barham, Courageous, Veteran,* and *Wanderer.*

The 2nd Battalion, The South Staffordshire Regiment; 2nd Battalion, The Green Howards; 1st Battalion, The South Wales Borderers; one company, 1st Battalion, The King's Regiment; one squadron Armoured Cars, 12th Lancers; Detachments of Royal Engineers, Signals, and Royal Army Service Corps; and one squadron, Royal Air Force.

[The Unit referred to was two flights of No. 45 (Bomber) Squadron from Helwan.]

Two infantry battalions at Malta have received orders to hold themselves in readiness if required.

With regard to the recent report that British troops being conveyed from Haifa in a railway train were attacked by Arabs and disarmed, no official report to this effect has been received.

A *Reuter* message from Jerusalem dated Aug. 27 states:—

The situation in Palestine may now be said to be well in hand, with sufficient forces available to preclude any fear of more than local and sporadic outbreaks and to ensure the power of the Government to deal with any such. From Friday to Sunday last week, however, the state of the country was extremely critical. During that time the total strength of the forces available was 1,200 members of the police force, of whom fewer than 200 were British, eight armoured cars, and a few aeroplanes.

The Colonial Office on Aug. 28 stated:—

There is little change in the situation since the last statement was issued. Jerusalem, Jaffa, and Haifa are reported as quiet, disorder in the neighbourhood of the last-named place being satisfactorily dealt with by a naval detachment from H.M.S. *Barham.*

Aircraft have been employed reconnoitring the disturbed areas, and fire from the air has been opened on parties of Arabs in the neighbourhood of Haifa, Ramleh, and on the hills around Jerusalem. A strong Arab concentration was reported south-east of Gaza, but aircraft have been unable to locate any parties of Arabs in the neighbourhood, and no attack has so far materialised.

The Times correspondent in Jerusalem in a message dated Aug. 29, states:—

In view of the statements which have been made on the subject it is important to make it quite clear that there has been no bombing of villages by aircraft during the disturbances, and that reckless firing on the part of troops and special constables is strictly forbidden.

Messages of sympathy with the Arabs have been received from the disaffected section of the Beni Sakhr tribe in Transjordan. The emissaries who brought these messages have been detained in Jerusalem pending inquiries. The attempts made to send arms and ammunition from the tribes in Transjordan to the Arabs in Palestine have been frustrated.

The Colonial Office on Aug. 29, stated:—

The situation both in Palestine and Transjordan continues to be quiet. A small outbreak at Safed last night was successfully quelled on the arrival of troops who were on their way before this disorder occurred. Considerable forces of Arabs are reported to have crossed the Syrian frontier into Palestine this morning. Aircraft have been despatched to check their progress.

The following statement was issued by the Colonial Office on Aug. 21:—

Our armed forces hold all the important centres in Palestine from Safed in the north to Beersheba in the south, and in this area the situation is reported as quiet.

It is reported that Beduin tribes in Sinai, Syria, and Transjordan are threatening to march on Palestine and that some have already crossed the frontier. Royal Air Force armoured cars have been sent to deal with the situation.

All the aircraft of the Fleet Air Arm carried by H.M.S. *Courageous* have been landed at Gaza.

The following statement was issued by the Colonial Office on Sept. 2:—

The country north of Safed is inclined to be restless, but in other districts the situation is reported as generally quiet.

Yesterday [Sunday] demonstration flights were carried out in strength by aircraft over the north and north-eastern areas of Palestine, where armed bands of Arabs were reported as crossing fom Syria. The proclamation by the High Commissioner of Palestine and Transjordan was distributed over the Jerusalem area by aircraft.

Lord Thomson's Tour of Service Stations.

The Secretary of State for Air, Lord Thomson, visited a number of Units of the R.A.F. during the week ending Aug. 31. On Aug. 26 he flew from Northolt to Tangmere, where he visited No. 1 (Fighter) Squadron and No. 43 (Fighter) Squadron. From there he went on the same day to Gosport, and watched the training work of the Fleet Air Arm.

On the morning of Aug. 27 he visited the Headquarters of No. 10 Group, and the School of Naval Co-operation, at Lee-on-Solent, and in the afternoon he went to Worthy Down. That night he watched the night bombing work of No. 58 (Bomber) Squadron.

On the morning of Aug. 28 he remained at Worthy Down to see the day-time work of the Squadron, and returned that afternoon by air to Northolt. On Aug. 29 he flew to Grantham, where he inspected No. 3 Flying Training School, and returned to Northolt by air the same day.

On Aug. 30 he visited Halton and inspected the School of Technical Training (Apprentices). On Aug. 31 he inspected the organisation of the Air Defence of Great Britain Headquarters at Uxbridge.

Permanent Commissions.

The following officers have been selected by the Air Council for permanent commissions, subject to physical fitness:—

Flight Lieutenants.—J. C. E. A. Johnson and G. H. Stainforth (Lieut., The Buffs, R.A.R.O.).

Flying Officers.—D. F. W. Atcherley (Lieut., The East Lancs. Regt.), G. D. Harvey.

These officers will be gazetted to permanent commissions with effect from Oct. 1, 1929. Flt. Lts. Johnson and Stainforth will not be called upon to refund the non-effective emoluments granted to them on retirement from the Royal

ENGINE INSTRUCTION.—The Secretary of State for Air, Lord Thomson, during a visit to the R.A.F. School of Technical Training (Apprentices), Halton.

Digitized by Google

Navy and Army respectively, but their service prior to the date on which they were granted short-service commissions will not count for retirement, retired pay or any other non-effective purpose.

Flt. Lt. Stainforth and Flg. Off. Atcherley have to forward applications to resign their commissions in the Army for transmission to the War Office.

Medium Service Commissions.

The following officers have been selected by the Air Council for Medium Service Commissions, subject to physical fitness:—

Flight Lieutenants.—R. Duncanson, A. H. J. Howlett, G. A. Simonds (Aug. 29, 1929); G. S. White (Nov. 24, 1929).

Flying Officers.—L. H. Brooke (Aug. 29, 1929); I. G. E. Dale (Mar. 31, 1930); D. W. Gibbon (Mar. 14, 1930); A. J. Holmes (Jan. 17, 1930); H. S. Martin (Aug. 29, 1929); E. G. H Russell-Stracey (Mar. 14, 1930); G. M. E. Shaw (Jan. 6, 1930); P. V. Williams (Mar. 14, 1930).

The selection of Flg. Off. Brooke is provisional only.

Transfers to the Reserve.

The following officers serving on short-service commissions are due to transfer to the Reserve on the dates indicated on the completion of their service on the active list of the R.A.F.:—

Flight Lieutenants.—S. D. Scott (Nov. 8), N. H. N. Fletcher (Nov. 12), R. A. W. Kerr, M.B. (Nov. 22), A. J. R. Moss (Dec. 9).

Flying Officers.—C. B. Rawlins, M.C. (Oct. 22), B. C. Mason (Dec. 9), J. H. Parry (Dec. 18).

Specialist Symbols.

The following officers have been granted the specialist symbols shown against their names:—

Sq. Ldr. C. B. Cooke (E), Sq. Ldr. R. C. Hardstaff (E), Sq. Ldr. P. B. Hunter (E), Sq. Ldr. A. S. Morris (E).

Flt. Lt. N. V. Wrigley (E), Flt. Lt. H. J. Adkins (E), Flt. Lt. R. A. Seaton (E).

Flg. Off. A. H. Harrison (E), Flg. Off. T. Marchant (E).

Flt. Lt. L. J. Chandler (S), Flt. Lt. W. A. Thompson (S).

The applications received from Flt. Lts. E. J. Kingston-McCloughry, J. Noonan, and G. Martyn are still under consideration, and an announcement will be made in due course. The other claims submitted have not been approved, and no further applications for specialist symbols will be considered except under the normal procedure.

Central Flying School Categories.

The undermentioned officers and airman pilots who attended the Flying Instructors' Course at the Central Flying School from May 21 to Aug. 5, 1929, have been categorised as follows:—

A.2.—*Flg. Offs.* E. S. Finch, J. W. Gillan, J. Norwood, P. M. Watt.

B.—*Flg. Offs.* A. P. Bett, L. T. Carruthers, C. E. Galpin, H. T. S. Jagger, B. E. Moody, E. G. Olson, J. H. Sender, N. A. West, The Marquess of Douglas and Clydesdale (A.A.F.).

361832 Sjt. Burch, R.; 335007 Sjt. Gillie, G. B.; 328962 Sjt. Orrell, J. H.; 362570 Sjt. Parsons, E. G.; 362116 Sjt. Payne, L. F.; 347560 Sjt. Simmonds, W. H.; 157062 Sjt. Tilbury, A. P.; 346763 Sjt. Winton, K. C.

C.—*Flg. Offs.* F. N. Moxham, H. E. Power.

The undermentioned officers and airman pilot have been re-categorised as under, from the dates stated against their names:—

A.2 to A.1.—Sq. Ldr. M. B. Frew, D.S.O., M.C., A.F.C., Aug. 12. Flt Lt. D. Macfadyen, July 15.

B. to A.2.—Flt. Lt. S. L. G. Pope, D.F.C., A.F.C., July 15. Flt. Lt. E. A. McKinley-Hay, Aug. 12. Flg. Off. G. R. Beamish, July 15. Flg. Off. R. R. Nash, Aug. 2. Flg. Off. H. A. Howes, Aug. 12. Flg. Off. W. F. Lovering, Aug. 12. Plt. Off. C. S. Ellison, Aug. 12. 244430 Sjt. Frost, C. S., Aug. 12.

The undermentioned officer has been categorised as "B" as from Aug. 9:—

Flt. Lt. F. K. Damant, D.F.C.

Categorisation of Flying Instructors.

The claims of the following to antedate on the strength of having qualified as flying instructors prior to the introduction of the existing C.F.S. categories, have been considered and they have been categorised as "B" Flying Instructors, thus entitling them to six months' antedate:—

Flight Lieutenants J. Lawson, N. S. Paynter, G. H. Harrison, S. H. Ware, E. S. Borthwick-Clarke.

The R.A.F. Swimming Association.

The R.A.F. Swimming Championships will be held at St. George's Baths, Buckingham Palace Road, S.W., on Sept. 13, at 20.15 hours.

As some districts are unable to hold their annual district Championships before Sept. 13 officers i/c swimming are requested to forward to their districts secretaries, not later than Sept. 6, the names of any outstanding swimmers in their units with particulars of their best times for various events.

A Service Contemporary.

The Planesman, a monthly journal for the Royal Air Force, gives all the latest news from R.A.F. Stations at home and abroad. It also gives comprehensive accounts of sports and athletics and has illustrated articles of topical and general interest. It only costs 6d. a month, and those officers and airmen of the R.A.F. who cannot buy it in their Unit should apply to the Editor, *The Planesman*, R.A.F., Eastchurch, Kent.

TO SEE THE SCHNEIDER CONTEST.

Those who have not yet made arrangements to see the Schneider Trophy Contest, and wish to see it from the water, may be able to obtain accommodation on moderate terms on the Friday and Saturday nights, or room on deck on Saturday, by applying at once to Lieut.-Col. Spenser Grey, D.S.O., Motor Yacht Falcon, c/o The Rising Sun Hotel, Warsash, Hamble River.

THE OFFICIAL SCHNEIDER COURSE, as selected in error and retained in obstinacy. Probably the true reason for having the Head-Quarters of the Committee on a ship off Ryde is to protect them from the assault of a disappointed crowd should the Contest be postponed.

THE

WESTLAND IV

THREE-ENGINED LIMOUSINE

(Cirrus-Hermes Engines).

The ideal machine for the business man.

Seats four passengers in totally enclosed cabin with seat for fifth alongside the Pilot (also in enclosed cabin). Ample luggage accommodation is provided. The windows are easily opened by the passengers, and there is an excellent view without obstruction due to the high wing construction. This machine is an ideal commercial and private vehicle, possessing the safety guarantee provided by having three engines combined with minimum maintenance costs. The machine is one that is suitable for use on feeder lines or where the traffic is not heavy enough to warrant the use of large multi-engined planes. It represents the equal of the Limousine as used by the business man for travelling by road to his various appointments.

THE "GRAF ZEPPELIN."

On Aug. 27 the *Graf Zeppelin* left Los Angeles on the last stage of its flight round the World from New York to New York. Shortly after starting, the ship scraped a high-tension electric cable with its tail but only slight damage was done. Later there was a suspicion that it might have difficulty in getting high enough to cross the Rockies and a considerable quantity of tins of superfluous foodstuffs was dumped overboard. Owing to storms the ship's course was changed slightly to pass over new Mexico, Oklahoma, and Kansas.

On Aug. 29 the *Graf Zeppelin* landed at Lakehurst, N.J., and her 16 passengers and 60,000 pieces of mail were landed.

Her journey round the World covered a distance of 21,000 miles, which was done in 21 days 7 hours 34 mins. elapsed time, or 11 days 33 mins. flying time.

On Aug. 30 the officers, crew and passengers, having been ferried from New Jersey to the Battery, paraded up Broadway and were received at the City Hall in the time-honoured fashion,—namely with rolls of ticker-tape and torn-up telephone directories, hurled in lieu of serpentines and confetti from the 30th story and upwards of office buildings.

On Sept. 1 the *Graf Zeppelin,* commanded by Capt. Lehmann, left Lakehurst to return to Friedrichshafen. Dr. Eckener is remaining behind in America to inspect the two airships which are being built at Akron by the Goodyear-Zeppelin Corporation.

Lord Thomson, Secretary of State for Air, has sent the following telegram to Dr. Eckener:—

Air Council tender hearty congratulations on successful completion of your epoch-making flight round the world.

A WANDERER'S RETURN.

The Melbourne correspondent of *The Daily Telegraph* reports that the Shell Organisation in Australia has bought a Westland IV, which will be used for linking up the company's widespread depots.

Mr. Owen and Captain Jones are proceeding to England in order to fly the newly purchased aeroplane back to Australia.

Captain Jones was formerly Deputy Controller of Civil Aviation in Australia. Mr. Owen will be remembered as Flt. Lt. Moir's companion when they tried to fly Mr. Hurley, the cinematographer, to England in an overloaded Ryan monoplane, which crashed at Athens on the last stage of the journey.

They flew back without Hurley in the Vickers Vellore, with a geared Jaguar, and crashed in the dark landing on the north coast of Australia.

VOUGHT-TRANSFERENCE.

On Aug. 28 Lieut. Gorton, U.S.N., flying a Vought Corsair two-seat reconnaissance biplane, succeeded in hooking himself onto the airship *Los Angeles* over Cleveland. The machine was hauled up close under the body of the ship and an officer was transferred from the ship to the aeroplane.

The Vought Corsair was thereafter lowered to flying position and Lieut. Gorton slipped his hook, dived away from the ship and landed safely. This is claimed to be the first time that a man has been transferred from an airship to an aeroplane.

A GERMAN-POLISH ENTENTE.

An Air Traffic agreement was signed in Berlin on Aug. 28 between Poland and Germany.

The lack of such an agreement has till now prevented any mutual air traffic, as special authorisation has been necessary if either Polish or German aircraft wished to fly over the other country's territory. There is now a likeliness that a direct service between Berlin and Warsaw will be organised.

ROHRBACH FLYING-BOATS IN THE U.S.A.

The American Metal Flying-boat Corporation has been formed in the United States with a capital of $2,000,000 to build Rohrbach flying-boats under licence.

The principal production of the company will be the Rohrbach Romar, which, in its American form, will have four air-cooled engines and will carry forty-five passengers.

AN ACCIDENT TO LADY HEATH.

Lady Heath, who has been in the aviation business in America since last year, crashed at Cleveland, Ohio, on August 29. She was taken to hospital with a fractured skull and internal injuries, and latest reports state that her recovery is doubtful.

She was flying at the National Air Races at Cleveland and was coming in to land with her engine shut off, and apparently stalled. The machine hit a wire stay from a chimney and crashed through a factory roof.

Mr. Irwin Kirk, her mechanic, jumped for the roof and, beyond fracturing an ankle and severing three fingers, was not much hurt.

RECORD FUTILITIES.

On August 30 Mr. T. G. Reid took off from Cleveland, Ohio, in an attempt to beat the solo endurance record for light aircraft. He succeeded in remaining in the air for 39 hours, after which he disappeared. An aerial search for him resulted in his being discovered dead fifty yards from his machine a few miles from Cleveland.

He had been promised large rewards for every hour by which he exceeded the previous record of 36 hours. Mr. Reid had been married the day before his attempt.

THE AEROPLANE has incurred the wrath of certain American journals when it has thought fit to criticise certain types of record attempts that are made in the United States. Re-fuelling duration records have achieved much publicity and have also resulted in the death of several aviators.

The solo endurance record is a still greater futility which, with the known reliability of modern aircraft and aero-engines, only encourages pilots to strain human endurance to breaking-point.

It seems deplorable that while the bulk of the American Aircraft Industry is striving its utmost to prove that aviation is a safe means of transportation, there is still a minority which will encourage and even finance spectacular records to gain publicity at the expense of human life.

The attempt in which Mr. Reid was killed took place during the National Air Races at Cleveland, and presumably it was staged as a draw for the public. Reports state that 250,000 spectators have witnessed them and that four deaths, including that of a woman, have marred the proceedings.

Such occurrences give one seriously to believe that the interests of the morbidly-minded public come before aviation progress and that the mentality of "Big Show" organisers has changed little since the Roman Circus.

THE PEEP SHOW.

The Arabs see the 'planes above;
"Alas," they wail, "more Christian love!"

"Bremen" or "Mauretania"
Have nothing on A. H. Orlebar.

"Graf Zeppelin" proudly wings its way:
What has R.101 to say?

CUTTY-SARK — CABIN FLYING BOAT

Twenty years' experience

in the design and production of aircraft, in addition to a century's work in marine construction, is the foundation upon which rests the new and modern organisation of Saunders-Roe.

Since the pioneering days of flying there have been Saunders seaplanes; and the name of Roe, associated as it is with the design of Britain's earliest aeroplanes, becomes, as it were, the final symbol to complete the hall-mark of proficiency in aeronautical research and design.

The flying-boats, seaplanes, and amphibians produced by the house of Saunders-Roe are backed by a combination of experiences, ideas, and achievements, together unique and outstanding in the sphere of aeronautical engineering. This vast constructional and servicing organisation is ready and well able to meet the world's demands for airworthy and seaworthy British marine aircraft.

THE LIGHT AEROPLANE AND THE FLYING CLUBS.

THE OPENING OF HANWORTH.

The London Air Park and Hanworth Club, the headquarters of the National Flying Services group of flying clubs, was opened on Aug. 31. The ceremony was performed by Her Grace the Duchess of Bedford, who fired a pyrotechnic landing signal, a 5½in. smoke shell, by electrical contact from a mortar in front of the Club enclosure.

The London Air Park at Hanworth covers an area of 230 acres with the buildings and gardens in the middle and the aerodrome all round. This is said to give a run of 1,000 yards in every direction of the wind—and it would be magnificent for a circular landing in a cyclone.

Hanworth is twelve miles from Hyde Park Corner and midway between Richmond and Staines. When the trick of finding the turning is known, perhaps the quickest way is by Hounslow, but the simplest is by Richmond and Twickenham, along the Sunbury Road.

National Flying Services, Ltd., intend to make Hanworth the centre for their operating services, including air-taxi services, and the maintenance and repair depot for all their aircraft. The company also hopes that private owners will use its landing and garaging facilities and that it will be a meeting-place for all members of the associated provincial centres.

The programme of the company is to establish ten provincial air parks and sixty intermediate landing grounds.

At Hanworth the north aerodrome will be used for commercial flying and the south aerodrome for club and private flying.

The club house is said to have been built by a Mr. Henry Perkins, a brewer, in 1799, on the site of old Hanworth House, which was said to have been a resort of Henry VIII. In the middle of the 16th century the manor of Hanworth was granted to Anne, Duchess of Somerset, the widow of the Protector. The original house was burnt down in 1797.

[Though not an expert in architecture, one would hazard the opinion that the cast-ironmongery which disfigures the front is mid-Victorian, though it may have been the brewer's brainwave.—C. G. G.]

National Flying Services have rebuilt part of the house and have decorated the interior in comfortable modern style, with flamboyant wallpapers and cretonnes. The garden has been rigorously tamed, and should be restored to some of its old beauty in the course of the next few years. Homegrown fruit and vegetables have been sacrificed to the requirements of the age, as the walled kitchen-garden has been laid out for hard tennis courts.

With a burst of optimistic sentiment the company states that the gardens are a sanctuary for birds of all kinds, including kingfishers. One is prepared to bet that no kingfisher will deign to live long in such close proximity to the covey of strange, noisy, unnatural, black and orange birds which have been introduced to the neighbourhood. Kingfishers are notoriously exclusive.

A neat piece of engineering has diverted the River Cardinal into underground pipes, leaving short stretches of it in the gardens only. With the departure of the birds and squirrels, natural history may be studied in the hordes of mosquitos which will undoubtedly breed therein.

The accommodation for aircraft includes three sheds, two of them 180ft. by 70ft., and one 90ft. by 70ft. Two of them are on the north side for commercial and general use and one on the south side for club use. Small lock-up aeroplane sheds are being built on the club side for private owners. These will be in blocks of four and eight. Twelve

HANWORTH AERODROME.—The school sheds are under the trees to the right of the chateau.

Digitized by Google

petrol pumps are being provided at various points by National Petrol Stations, Ltd.—a subsidiary of National Flying Services.

National Flying Services, Ltd., are also the owners of several acres of factory buildings and some houses on the north-west side of the aerodrome. These are let to tenants. In this area will be a fully equipped overhaul works and stores depot for light aeroplanes.

The Hanworth Club is organised on the lines of other flying clubs, with flying and non-flying members. The entrance fee is £5 5s., and the annual subscription is £5 5s. for flying members and £3 3s. for non-flying members. Serving officers of the R.A.F. are admitted without entrance fee. Flying instruction will cost £2 an hour for dual and £1 15s. an hour for solo flying. Aircraft can be hired by competent flying members from £1 10s. an hour to £1 1s. an hour, according to the number of hours flown in the course of a year.

The company deals in secondhand aeroplanes.

The flying organisation is under the control of Mr. T. N. Stack, A.F.C., who is the Chief Pilot and Air Superintendent. Thirteen pilots have already been engaged to work under him, and none of them has had less then 500 hours of flying experience. They are:—

Flt.-Lt. the Hon. J. B. Rodney, M.C., R.A.F.O. (manager of the Hanworth Club), Mr. H. M. Schofield (First Pilot), R.A.F.O., Mr. C. A. Pennington (Second Pilot), Mr. H. T. Talbot-Lehmann, M.C., Flt. Lt. J. B. Wilson, R.A.F.O., Mr. M. H. Findlay, D.S.C., D.F.C., R.A.F.O., Mr. I. W. Mackenzie, R.A.F.O., Mr. W. A. Andrews, Mr. A. H. Alliott, R.A.F.O., Mr. J. J. Flynn, R.A.F.O., Mr. A. D. Page, M.M., R.A.F.O., Mr. R. T. Shepherd, R.A.F.O., and Mr. L. A. Egglesfield, R.A.F.O.

The pilots and mechanics are, with an undoubted error of judgment if not of taste on the part of their employers, dressed in a uniform which has already been illustrated in THE AEROPLANE. They wear the ribbons of military decorations on this civil uniform.

Air taxis are supplied at 1s. a mile for one passenger and 1s. 6d. a mile for two passengers. They may be picked up at Hanworth, Croydon, or any of the provincial centres. Short passenger flights are also given from 5s. to £3.

The Opening Party.

The Garden Party and Flying Display with which the Hanworth Air Park was officially opened on Aug. 31 started at 15.00 hours when the guests were received at the Club House by Sq.-Ldr. the Rt. Hon. F. E. Guest, P.C., D.S.O., and the Directors of National Flying Services, Ltd. From 15.00 hours until 16.30 hours the guests inspected the club house and garden, and had tea on the lawn.

Invitations to this inaugural meeting are said to have been issued to prospective club members, to enquirers at the firm's stand at Olympia, and those who have enquired by post, as well as to the aeronautical community as a whole. And, judging by the varied classes which were represented in the crowd, the aspirations of National Flying Services are, apparently, of a very comprehensive nature.

[The Club House advertised at the door, dinner and dance for members at 15s., but the majority of the crowd hardly seemed up to the weight—which inspired a would-be humorist to suggest that apparently the firm was trying benevolently to provide Carlton accommodation for a Corner House clientèle.—C. G. G.]

THE OPENING CEREMONY.—Left to right: Col. Sempill, Lieut. Sala (French Air Attaché), Lady Bailey, Air Marshal Sir Edward Ellington, Sir Sefton Brancker, The Duchess of Bedford, Sq. Ldr. Guest.
—("Aeroplane" photograph.)

The meeting was well supported by visiting owner-pilots, members of flying clubs and those who are temporarily or permanently in possession of aircraft for commercial or pleasure purposes. In addition to National Flying Services' own fleet in the distinctive but gaudy black-and-orange colours of the company, there were about 40 or 50 visiting machines, mostly Moths. These included Sq.-Ldr. Guest's Junkers, the first Desoutter monoplane, a Caudron, a Klemm, the Clarke Cheetah, and various Avians, Widgeons and Bluebirds.

No. 600 (City of London) Squadron—Sq.-Ldr. Guest's squadron of the Auxiliary Air Force—came over from Hendon in three D.H.9a's, one Wapiti, and one Avro Lynx.

After the Duchess of Bedford had declared the Air Park open, No. 600 Squadron took off and flew past in flight formation, followed by three Moths of N.F.S., which

AT HANWORTH.—A general view, with Mr. Neville Stack in the air. —("Aeroplane" photograph.)

also took off in formation. There was then a fly-past of various types. These included a Moth, a Spartan, an Avian, the Martlet, the Dessouter, the Moth amphibian, a three-seat Spartan, a coupé Gipsy-Moth, a Jupiter VI. Wapiti, and an Avro Lynx.

The machines flew round three times, slightly varying their performance each time, and finishing with a dive and a sharp climbing turn past the enclosure.

The next event was a display of aerobatics by Mr. Leach in the Martlet (A.B.C. Hornet engine), the new single-seat light aeroplane designed and built by the Southern Aircraft Company. The Martlet put up an amazing performance. If the object of some of the guests was to "have a good scream," they certainly achieved results. Other guests thought the company were fortunate not to achieve the undesirable publicity which would have been gained if the machine had landed on top of the crowd. However, it was quite a fine display of aerobatics, and the pilot handled the machine with undoubted skill and judgment. The Hornet engine, which was making its first public appearance, made an excellent impression. It should win considerable popularity, as it has many good selling points, and certainly has a good performance.

Thereafter Mr. Neville Stack, Chief Pilot, or Group Captain, of the N.F.S. flying staff, put up a fine show on the white Moth with a Cirrus engine which was presented to him as a parting gift by A.D.C. Aircraft Ltd.

Mr. Cordes then demonstrated slow flying in a slotted Moth. This was interesting without being impressive. Next, Mr. H. M. Schofield demonstrated slow rolls and inverted gliding on a Simmonds Spartan. This was much appreciated by that section of the crowd which loves to point out to its offspring that "the wheels are on top."

The bombing of the Austin "Baby" by three "second pilots" of N.F.S. was particularly remarkable by reason of the wildly inaccurate bombing.

Mr. John Tranum, who has proved, to his own satisfaction, apparently, 700 times "that it is better to leap within ourselves than tarry till they push us," did his now famous if not inevitable parachute drop.

Another demonstration of slow flying was given by Mr. Staniland in a Simmonds Spartan. His machine was one of the latest type with an increased span of four feet (two feet per wing). The get-off of the machine and the slowness of its landing is now quite remarkable, and the speed is, if anything, slightly higher.

The formation flying and stunting by three pilots of N.F.S. on Moths was quite a pretty little show, and the pilot who lost position at the end of a loop only added to the excitement by getting back into position with a complete tail-slide.

The meeting ended with a fly past and salute by pilots of N.F.S. The salute was not a new one invented by the perpetrator of the uniforms, but just a dive past in the air.—C. M. MCA.

ON THE NEW FLYING SUITINGS.

The following letter from a former officer of the R.F.C. deserves attention:—

Sir,—One does not wish to be in any way unduly critical of the activities of National Flying Services Ltd. as that company appears to be doing so much to help forward the cause of aviation in this country. Nor does one want to appear mawkishly sentimental concerning matters that are very much past history.

But at the same time, may I, for one, express at least a mild tinge of regret that the N.F.S. should have seen fit to put its pilots into what is quite obviously a copy of the old R.F.C. uniform?

To give their pilots uniform is an excellent idea, and one can sympathise with the desire of the company to make that uniform distinctive. Yet, somehow, I cannot quite fancy the idea of our old kit being turned—I do not say to base uses, but to any use other than that for which it was originally employed. It is not, even, as if the uniform were particularly suitable in itself,—as some of us remember,—it is not too easy to make really well.

I cannot help wishing that the N.F.S. would think again—and let the R.F.C. uniform rest with the past to which it belongs. "45."

I.F.S.?

The following view may also be of interest:—

Sir,—I met many people in the crowd at Hanworth yesterday who all raised the same point voluntarily. They were persons of sense, so their opinions may be worth while.

They thought that as the Right Hon. Sq. Ldr. F. E. Guest flies in a German aeroplane, motors in an American motor-car, and dresses his pilots like bandmasters in the dear old George Edwardes musical comedies, he might do well to re-entitle his scheme as INTER-national Flying Services! (Signed) "MIDDLESEX."

THE AFTERMATH OF ORLY.

Even now there may be interest in indicating how the curious placings in the Orly Meeting happened.

The marks for speed over the whole tour were allotted thus:—

In the class for bigger aircraft, Category A, 50 marks were given for an average speed of 143 kilometres per hour. Marks were deducted for any speed below that.

In the smaller class, Category B, 50 marks were given for an average speed of 126 kilometres per hour, and marks were deducted for any lower speed.

In each class 20 additional marks were given for the machine doing the highest speed over the course. 10 marks were given for the second highest speed, and 5 marks for the third highest speed.

The result was that Lord Carbery won the 20 marks for the highest speed in Category A and Morzik won the 20 marks for the highest speed in Category B.

Mr. Broad, who was a mere half a kilometre an hour slower than Lord Carbery in Category A, won the 10 marks for second place, but the additional 10 marks were enough to bring Lord Carbery next to him in the total number of marks, in spite of all the marks Lord Carbery's machine had lost for lack of certain desirable qualities.

Similarly, Morzik, by winning the 20 marks in Category B, managed to pile up a total which put him just in front of Mr. Broad in the aggregate for both classes.

AT HANWORTH.—The Desoutter monoplane (Cirrus) and the Martlet biplane (Hornet).—("Aeroplane" photograph.)

BENDIX BRAKES for GROUND CONTROL

Bendix "Servo" Brakes are recognised by Airplane Manufacturers as the standard safety unit essential for perfect ground control.

Bendix Brakes control and reduce the run after landing to a minimum, enabling safe landings to be made in small areas.

Eliminate the necessity for a ground crew, since the airplane can be warmed up, taxied and parked in hangar without external assistance.

Provide perfect control on the ground when separately operated, thus preventing disastrous ground loops and permitting cross-wind taxi-ing and take-off.

Permit the use of a tail wheel instead of a tail skid and avoid tearing up the airdrome.

No pilot need be without Bendix "Servo" Brakes if he specifies them when ordering his machine.

THE HADLEIGH AIR RALLY.—On the left are Mr. R. Quilter who won the landing competition and Mr. John Tranum ready to go up for a parachute descent. On the right are the two Belgian visitors who flew from Brussels to Hadleigh—M. Maus and the Comte de Looz.

THE HADLEIGH RALLY.

In spite of fine, though somewhat windy weather, the International Air Rally at Hadleigh, organised by the Suffolk and Eastern Counties Aeroplane Club on Aug. 31 and Sept. 1, was poorly attended, with the exception of the usual hedge patrons.

The number of visiting aircraft was also small, but this was no doubt due to the counter-attraction at Hanworth. Although described as an *international* meeting, the only foreign visitor was M. Maus, who flew over with a passenger from Brussels in his St. Hubert monoplane. This machine, bearing the marking H2, was flown by M. Maus in the *Challenge Internationale de Tourisme*.

The International Rally was won by that veteran sportsman, Mr. Richardson, of Norwich, on his Klemm. The first prize was £25. The second prize of £10 went to Mr. C. B. Wilson, in a Coupé Moth (AAHS). This machine was flown by Mr. H. S. Broad, at Orly, and is now being used by *The Daily Mail* while "Geraldine" is in dry dock.

Flt. Lieut. T. Rose won third place in the Rally with Moth AAKJ belonging to Pratt's.

Early on Saturday morning the Southern Aero Club's Martlet paid a brief visit from Martlesham, where it was undergoing type tests. It went on to Hanworth for the afternoon, and back to Martlesham later.

This machine is a converted Avro Baby with an A.B.C. Hornet engine (4-cylinder flat opposed). It has a very pleasing appearance. It has been thoroughly cleaned up and climbs steeply at a remarkable rate.

After zero hour a number of machines arrived, including Mr. Ivor McClure in Moth EBUR, Mr. Courcellis, of Norwich, in Gipsy-Moth AAEI, Mr. R. P. Cooper, from the London Aeroplane Club, in Moth AAAV, and Mr. G. Wheatley, in "Arom II," the golden Coupé Moth AAIM, belonging to the Shell-Mex organisation.

The programme on Saturday was opened by Mr. G. E. Lowdell, who gave a demonstration of crazy flying in one of the club's Bluebirds.

After this Sir T. Courtenay Warner, Bart., Lord Lieutenant of the County, inspected the machines, which then took off and flew past the enclosures.

His Highness the Bandhavesh Marharaja Saheb of Rewa paid a visit to the club in the afternoon and was much interested in the machines.

An excellent display of formation flying was next given by the three club Bluebirds, piloted by Mr. G. E. Lowdell, Mr. Courtney Prentice, and Dr. J. C. Sleigh.

These machines subsequently took part in "A Frontier Scrap." A force of hostile tribesmen, in striking sheiks' clothing, holding a fort, were attacked by aircraft, one of

AT HADLEIGH.—Left to right: Mr. G. E. Lowdell (Club Instructor); Mr. Robert Blackburn (of the Blackburn Aeroplane Co.); Dr. J. C. Sleigh (Chairman of the Suffolk Aeroplane Club); Mr. H. L. Billington and Mr. Clayton (pilot).

Digitized by Google

which was shot down. The fort was bombed and burned in the correct manner. This was quite a good show. The "tribesmen" later turned out to be a detachment of the Rifle Brigade, whose buglers also contributed to the programme.

An aerial combat was then provided by two Moths, AAKJ and EBWA, piloted by Mr. Lowdell and Mr. Murray respectively.

At 16.45 hours the flying programme was interrupted by a motor-cycle gymkhana by, one supposes, local dirt track wizards.

This was followed by a round of aerial golf, which was won by Flt. Lt. T. Rose in a Moth.

Mr. Cubitt, in an Avian (AAHE), arrived in the afternoon, and was followed by M. Luck R. Nieuwenhuizen in Moth AG from Brooklands, and Mr. Raymond Quilter in Moth DD. Major Pickthorne brought over the Brooklands Flying School Avro from Clacton, and gave pleasure flights.

A very clever and amusing alternative to the wedding party turn was next performed. We were informed that Captain Shotup, of the Texas Rangers, would give an exhibition of sharpshooting from the air. Piloted by Mr. Lowdell, Captain Shotup amazed us with his marksmanship in hitting bottles hung on a canvas screen. We were soon to be disillusioned however, when from behind the canvas appeared a figure in cap and gown, and an umbrella, who bore a close resemblance to Mr. Murray.

The programme was concluded with the bombing of "Babies," and the remainder of the evening was devoted to pleasure flights.

During this time Mr. Clarke, R.A.F., arrived in his Cheetah, and Flt. Lieut. A. F. Scroggs in a D.H.53. Mr. R. B. Cazalet also flew over in his Widgeon RM. He overshot the aerodrome in landing and had the misfortune to run into the tail of one of the Suffolk Club's Bluebirds. The rudder and left aileron of the latter was smashed, and the propeller and leading edge of the left wing of the Widgeon was damaged.

Sunday, September 1.

The programme was opened at 14.00 hours by a demonstration by Mr. Murray on Moth EBWA of aerobatics. His loops and slow rolls were beautiful. He also did spins, the falling leaf, and inverted flying across the aerodrome. He is quite a new pilot, who learned to fly at the Brooklands School, but he is well up to front-rank form.

Another exhibition of formation flying was given in the club's two remaining Bluebirds, piloted by Mr. Lowdell and Mr. Prentice, and a Gipsy-Bluebird, piloted by Mr. Woodhead.

Mr. Lowdell then gave a display of crazy flying in a club Bluebird.

It was announced that the Autogiro would not be coming over as had been expected. Captain Shotup thereupon repeated his performance with variations.

The rest of the programme was very similar to that of the previous day. There was a good deal of time between events, and interest consequently flagged.

The proceedings were enlivened by a parachute drop by Mr. John Tranum from a Moth. He was limping badly from injury to his ankle in a motor-cycle accident, but he sportingly carried on.

The next event was a landing competition. Pilots had to fly to 1,000 feet, shut off their engines, and land near a given mark on the aerodrome. This was won by Mr. R. Quilter in Gipsy-Moth DD. Second prize went to Mr. C. B. Wilson in Moth HS.

At 15.45 hours M. Mans left for Brussels in his St. Hubert monoplane.

A balloon-bursting competition was the next item, but this was marred by the fact that many of the balloons were carried by the wind right across the aerodrome, and it was hard to see what was happening. This was won by Flt. Lt. Chick, who later gave an exhibition of aerobatics in a Moth, which concluded the programme.

It is a pity that the display was not better attended, as one learns that a considerable amount of time had been spent in preparation, but one suggests that more attention be paid to advertising in the future. One saw a few posters in Ipswich, and that was all.

Major Holmes, who has been secretary of the club for a long time, has resigned. The new secretary is Mr. W. J. Offord.

THE LANCASHIRE AERO CLUB.

On Saturday, Sept. 14, the Lancashire Aero Club is holding its first aerial "At Home" at the Avro Aerodrome, Woodford, Cheshire

The party will begin at 2 p.m. and will continue, weather permitting, throughout the afternoon and evening. There will be a number of informal flying competitions open to visiting pilots, including Aerial Golf, Balloon Bursting, and a novel Aerial Treasure Hunt. There will also be a duration contest for model aeroplanes, open to all comers. (Any type of model aeroplane may be entered, but refuelling in the air is barred!)

Tea will be served in the Club House during the afternoon. At the end of the flying events supper will be served, followed by a dance in the Club House verandah.

Many times in the past the Lancashire Aero Club has had the support of pilots, clubs and manufacturers in connection with public flying meetings. They hope to have the pleasure on the 14th of acting as hosts to as many of these supporters as possible, and a cordial invitation is issued to all who possess (or can beg, borrow or steal) an aeroplane to come over to Woodford on that date and join the party. [Unfortunately, it clashes with the opening meeting of the Leicestershire Club.—Ed.]

There will be no public flying display, but something will be going on all the time, and aerial visitors can enter for any events in which they would like to take part on arrival. The supper and dance at the Club House in the evening will also be of an informal nature and evening dress will not be worn. The Club will be glad, however, if those who are staying for the evening, and have not made any special arrangements, will let the secretary know in advance.

THE YORKSHIRE AEROPLANE CLUB.

The total flying time for the Yorkshire Aeroplane Club for the month of August was 106 hours 15 minutes. Six new flying members and two associate members joined.

On Aug. 5, Mr. Ivo Thomson and Mr. Ellison took a machine to the Air Rally at Scarborough and succeeded in winning the Landing Competition. The following day they gave an exhibition of aerobatics over Clarence Park, Wakefield, at the request of the Wakefield Motor Club.

Mrs. Birch did her first solo on Aug. 27, and put up a very good show.

THE NORTHAMPTONSHIRE AERO CLUB.

The Northamptonshire Aero Club are holding a week-end meeting at Sywell, on Saturday, Sept. 28.

A novelty competition is being organised by Mr. Hubert Broad for professional pilots, and another competition for private owners, details of which will be circulated on application to the Secretary, 19, Market Square, Northampton.

Members of other clubs, and private owners, are cordially invited.

THE LEICESTERSHIRE AERO CLUB.

The opening meeting of the Leicestershire Aero Club has been fixed for Saturday, Sept. 14, instead of the 28th, as previously announced. The usual races and competitions will be arranged.

The position of the Club's aerodrome at Desford was given as E.S.E. of Leicester in their last report. This is a mistake, the correct bearing being West by South of Leicester.

Visiting pilots and passengers are cordially invited, and will be the guests of the Leicestershire Club.

Promises of support have already been received from the De Havilland Aircraft Co., Ltd., from the Northamptonshire Club, from the Nottingham Club, and from several private owners.

THE CINQUE PORTS FLYING CLUB.

On Sunday, Aug. 25, an astonishing performance was put up by Dr. Furlong of Dublin, a town in Ireland. Dr. Furlong joined the Club on Aug. 17 and had to return to Ireland on Monday, Aug. 26. He had had a little previous instruction in Ireland in another type of machine, but not in a Moth. Sunday, the 25th, was the eighth day after he began instruction at Lympne, and Mr. Brown launched him solo at 14.38 hours. He did very well in his first solo flight and throughout the afternoon flew consistently. By 19.15 hours he had completed all his flight tests for "A" License. This is probably a record for quick tuition in any Club.

On the same day Mr. W. J. A. R. Cooke of Mayfield, Sussex, also passed his flight test for "A" License.

Besides getting two "A" Licenses on the 25th, Mr. Brown beat all previous Club records for one day's flying by keeping the two machines in the air for 11 hours 5 mins., which is roughly a distance flown of 825 miles by the two machines in the one day.

On this day the Club was visited by the Vicomte Jacques de Sibour who recently travelled round the world with his wife, and a Moth. He brought with him to Lympne Sq. Ldr. Jones-Williams (who was senior Pilot of the Fairey Long-Range Monoplane which flew to India non-stop), Flt. Lt. Fressanges (one of the pilots who made the historic rescues from Kabul), and Mr. Gordon Selfridge, Junr., who is learning to fly at the present time.

On Wednesday, Aug. 28, the Club was visited by the President, Earl Beauchamp, K.G., Lord Warden of the Cinque Ports, accompanied by his son Lord Elmlie, who is learning with the Norfolk Club.

The Club thought that it could not beat its record for July until another machine was in commission, as it seemed that the record of 124 hours was about the limit for a Club working with only one Instructor and two machines. But during August Mr. Brown established a new record for the Club. The two machines made 331 flights, totalling 139 hours 10 mins. in the air, equal to a distance flown of over 10,000 miles.

This total represents a splendid achievement upon which the Club heartily congratulates Mr. K. K. Brown and his staff. Mr. Brown himself actually flew over 96 hours in 27 flying days, which means very hard work. The membership at the end of August totalled 111.

The Club will be closed for Holidays on the evening of October the 6th, reopening on October the 16th.

SUPREME THROUGH THE YEARS

1913

This was the year when Palmer produced the first Landing Wheels and Tyres specially designed for Aeroplane use. Palmer was the only tyre manufacturer who made any intelligent effort to grapple with the problem of supplying Aircraft constructors with suitable Landing equipment.

1914-1918

These were the War years, when the entire British demand for Aeroplane Landing Wheels and Tyres was met by Palmer. *Every* British machine which left England was equipped with Palmer Landing Wheels and Tyres.

1919-1929

In the years since the war continuous research and new technical advances have kept Palmer Landing Wheels and Tyres first in efficiency and popularity. They have been chosen for all the notable flights undertaken on British machines, they are fitted as standard equipment on the great majority of British machines, and they are used in every country in the World where Aeroplanes are employed.

PALMER

And now comes the Palmer Aircraft Brake which satisfactorily solves, in an exceedingly simple manner, the problem of an efficient braking device for aircraft. All who are interested in safer flying should get particulars of this—the latest Palmer innovation.

COMMERCIAL AERONAUTICS.

THE HEINKEL K-2 CATAPULT.

Catapult-starting for sea-going aircraft has been in use some time in naval aviation. In the last year or two, attempts have been made to use similar methods for speeding up mails across the Atlantic.

In August, 1928, a Loiré et Olivier flying-boat with a 480 h.p. Gnome-Rhône Jupiter engine was launched by catapult from the French liner *Ile de France*, when the ship was still 500 miles from New York. By flying this distance 24 hours was saved over the ordinary mail-transit time. The scheme was suspended in October of the same year, after a flying-boat from the same ship had been forced to alight on the sea near the Scillies.

The North German Lloyd liner *Bremen*, recently very much to the fore as a result of her winning the blue riband from the *Mauretania*, has been equipped with a catapult.

This catapult, which has been designed and built by the well-known German firm of aircraft constructors, Ernst Heinkel Flugzeugwerke G.m.b.H., is used to launch an H.E.12 Heinkel low-wing monoplane (500 h.p. Pratt and Whitney Hornet engine). This seaplane is being used to deliver mail and customs papers ahead of the ship.

The Heinkel catapult as fitted to the *Bremen* consists of a skid or launching trolley accelerated over a launching-way about 60 ft. long. The skid is operated by compressed air. The catapult is mounted on the top deck of the *Bremen* between the two funnels. The turntable on which it is mounted allows the launching way to be swung through 90° on either side of the ship's course.

The launching way is a light angle-iron structure 20 m. (60 ft. 7in.) long. On the top surface of this structure which is plated to form a platform, are the rails, which appear to be angle-irons bolted to the sides.

The skid or launching trolley is built of high-grade material highly stressed to keep the weight as low as possible. The skid travels on four shoes and is pulled forward by a cable passing over a return pulley at the nose of the launching-way.

Two additional cables run aft from the skid to a drum at the starting end of the launching-way. These cables besides serving for testing purposes also appear to operate the brakes. The skid is brought to a standstill in a distance of 3 m. (9 ft. 10 in.).

The operating mechanism consists of a cylinder and piston. This piston has a stroke equal to one-sixth of the accelerating distance on the launching-way and is forced out by compressed air from the ship's normal supply.

The cable after passing over the pulley at the nose of the launching-way passes over a fixed pulley at the inner end of the structure. From here the cable is wound several times alternately round pulleys on the piston and pulleys fixed to the structure. When the piston moves outwards, more cable is needed to span the distance between the fixed pulleys and those on the piston. This has the effect of dragging the skid forward at many times the speed of the piston.

The ropes that run aft to the braking apparatus can also be used to rotate a fly wheel which acts as an indicator that the catapult is operating correctly.

The maximum acceleration produced by the catapult is not over 3G, and the flying-off speed is given as 110 km./hr. (68 m.p.h.). The maximum weight of the skid complete with machine in place is 3,500 kgs. (7,730 lbs.).

A RIVAL TO THE CATAPULT.

So far all attempts to use seaplanes in conjunction with steamships have been made either with specially prepared runways or catapult launching devices. The latter method postulates the use of a crane to pick up the seaplane from the water on its return.

A long runway is not practicable on a liner and a catapult is expensive. In addition if a catapult be used, the ship must be stopped to pick the seaplane up from the water and fast mail-steamers must not stop.

A method for launching and picking up seaplanes, which is used when the vessel is under way and has the important advantage of low initial cost, is known to our German friends as the Kiwullsche Stausegel,—or the Watersail designed by Dipl. Ing. Kiwull.

The Watersail is an expanse of canvas about 30 m. (98 ft.) long and 10 m. (32 ft. 9 in.) wide with spreader booms on the

THE HEINKEL CATAPULT ON THE "BREMEN."—Here Mr. Anthony Fokker is seen pointing at the catapult, with Mr. Heinkel beside him, and Baron von Studnitz, the pilot of the machine, on this side of Mr. Heinkel. Capt. Bunker of the U.S. Lines is facing them. The Heinkel monoplane is launched at the correct angle for a 68 m.p.hr. flying speed, whereas in the British and U.S. Navies the machines are launched at about 60 m.p.hr. and at an angle which needs about 100 m.p.hr. flying-speed.

Digitized by Google

THE KIWULL DROGUE.—Hauling a seaplane aboard.

underside. One end of this canvas runway is attached to the deck over the stern of the steamer and the other ends in a kind of drogue made of wide-mesh netting. This end is attached to the ship by tow-ropes.

The action of the drogue is to cause the water to roll in over the end of the drogue thus making it easy for a seaplane to taxi behind the steamer, and run onto the trailing runway. Once on the runway the floats are attached to skids, and the whole machine is hauled up the inclined canvas slope,—which is held taut by the pull of the drogue.

The process may be reversed for launching, as can be seen from the photographs. The men on the job appear to have little difficulty in doing work on the machine, so that the whole apparatus appears to ride steadily behind the steamer.

The Norddeutsche Lloyd Steamship Company are making extensive trials of this apparatus, which has been fitted experimentally to their local pleasure-ship *Roland* and their steamship the *Lützow*.

CHERBOURG JUNCTION.

Cherbourg is becoming the junction between the Air and the Atlantic. For some time now catapulted seaplanes have been landing there after flying from inward-bound liners and now further schemes are afoot.

A daily seaplane service between Cherbourg and Southampton is scheduled to start on September 15. The Luft Hansa and the Air Union have made arrangements with the North German Lloyd Steamship Co. and the Hamburg Amerika Line for a regular air service connecting Cherbourg and Cologne.

This linking up means of course that passengers from the Transatlantic liners can very speedily reach the middle of Europe and conversely passengers from mid-Europe can leave themselves much less time in which to catch the American boats.

THE USE OF TRI-COLOURED NAVIGATION LIGHTS.

Flying machines with a wing span of less than 60ft. are regarded as complying with the rules and regulations if they display the following modified lights:—

Two tri-coloured lights, one mounted above the centre-section of the aircraft and the other below the fuselage, instead of the usual side and tail navigation lights.

The lamps should be so constructed as to show a green light on the right side, a red light on the left side, and a white light astern, through the angles already prescribed.

This *Air Ministry Notice to Airmen* No. 51 of the year 1929 concludes by saying that flying-machines with a wing span of over 60ft. must carry the usual separate navigation lights.

AUSTRALIAN AIR MAIL.

The Postmaster-General announces that correspondence for Australia despatched from London on Saturdays by the England-India Air Service will now connect at Colombo with the mail that left London by ordinary route on the previous Thursday.

Correspondence for destinations beyond India—e.g., Ceylon, Straits Settlements, Hong Kong, Australia, New Zealand, can, therefore, now be sent by the India Air Mail, thus allowing about 1½ days' later posting than by the ordinary route. The latest time of posting is 7 a.m. on Saturdays at the General Post Office, London.

The air fee is the same as for India, namely, 6d. per *half*-ounce, in addition to ordinary postage.

Letters, etc., to be sent by the Perth-Adelaide Air Mail in Australia, as well as by the India Air Service, must carry the additional fee for the Australia Air Service, namely, 3d. per *half*-ounce, must also be prepaid, or 9d. per half-ounce in addition to the ordinary postage.

ARRANGEMENTS FOR THE CHANNEL AIR PASSAGE.

The pilots of machines about to cross the Channel, who have no W/T equipment, should read the *Air Ministry Notice to Airmen* No. 52 of the year 1929, which describes the necessary procedure in case the crossing is abandoned.

This procedure is particularly important, as failure to report the cancellation may cause a lot of trouble in the unnecessary organisation of a search.

An aircraft which has effected a circuit around Lympne aerodrome indicating departure for the Continent, but which is obliged, owing to weather or other cause, to abandon the attempt to cross the Channel, must return to Lympne and circuit the aerodrome a second time, such circuit being continued until the signal of acknowledgment (defined in Notice to Airmen No. 6 of 1929) is given. This second circuit will have the effect of cancelling the first circuit.

At present this "cancellation" procedure is only to be employed at Lympne aerodrome. Arrangements may be made later for its adoption at the Continental reporting points.

The notice concludes by stating that the search and rescue service has been augmented by a flying boat belonging to *Compagnie Aérienne Française*, which is available for patrol duty from Calais.

B. GRASE.

European Aviation has suffered a great loss by the death of Mr. B. Grasé, the chief of the test establishment of the Fokker Works in Amsterdam. There can be but few high officials on the Technical or Supply sides of the Air Services of all European nations who have not come in contact with him, or who have not admired his ability as a demonstration pilot and his high level as a scientific and practical engineer.

One never had an opportunity of knowing him well, but from friends in all nations one has heard only good of him. He was liked as a man, respected as a technician and admired as a pilot. To his family, and to his collaborators at the Fokker works one offers sincere condolences on his death at such an early age, and on the verge of such a promising career.—C. G. G.

One of his intimate friends writes:—

After a long and painful illness, the Chief of the Scientific Department and test pilot of the Fokker Works, Mr. B. Grasé, M.E., died at Amsterdam on Aug. 27.

Mr. Grasé was born on May 4, 1891. He studied mechanics at the Delft University and passed with honours the examination for mechanical engineer, a distinction which is only rarely awarded, and indicated his great ability in scientific-technical matters.

His interest in the scientific side of mechanics combined with his love for sports and his interest in aviation were the right base for his first function, which he accepted after having finished his study, i.e., engineer with the Ryks Studiedienst voor de Luchtvaart (National Research Institute for Aeronautics). He entered on Sept. 8, 1918, and as soon as this organisation had been completely installed—which was in the beginning of 1919—and it became desirable for the Institute to have an engineer-pilot at its disposal, Mr. Grasé was the right man in the right place.

He, therefore, was attached to the military flying service at Soesterberg where he learned to fly. He got his ticket on Feb. 27, 1920, after which he continued his training by interrupting his work at the National Institute with periods of training at Soesterberg and Schiphol. His extraordinary aptitude as a pilot soon appeared.

Not only did he fly with unusual gallantry, but he found in his scientific and technical knowledge a touchstone to analyse the qualities of the machines he flew.

Mr. Fokker, who himself possesses this rare combination of being an extraordinary pilot and having a cool criticising mind soon discovered the qualities of Mr. Grasé and enabled him to fly various new types.

This co-operation quickly led to the mutual desire to come to a closer form of collaboration and on June 1, 1923, Mr. Grasé left the R.S.L. and entered the Nederlandsche Vliegtuigenfabriek as Chief of the Scientific Department, in which function he had to fly and test all new types, to study them and indicate the necessary improvements. Since then Mr. Grasé has been with the Nederlandsche Vliegtuigenfabriek, and his advice has contributed to a high degree to the development of new types and his ability as a pilot has greatly furthered the success of the Fokker products.

Mr. Grasé was well-known in the whole of Europe and beyond. In 1924 he secured a big success for the Fokker Works in a military competition at Madrid and further by obtaining the second place in the Rally to Gothenburg. In 1925 he broke four World's Speed Records with useful load in the single-seater fighter Fokker D.XIII. and soon afterwards he improved on the existing World's Altitude Record with 1,000 kgs. load in an F.VII.

To recall the whole list of Mr. Grasé's special performances would take us too far afield. With a few exceptions all new types have been tested and made *au point* by him.

In the last years the malady which was then not yet discerned, but which finally carried him off, was often an annoyance to him; but it could not prevent him from achieving his task. In the Autumn of 1928 he started for a demonstration flight to the Balkans and Turkey, after having been operated upon before his departure, and apparently being cured. Notwithstanding the fact that during this trip new troubles arose, he continued fulfilling his duty without speaking of his suffering. He returned towards the end of January last, after a series of fine performances, cheerful about the results obtained.

Since he has been confined to a sick-bed.

Netherlands Aviation in general and the Fokker Works particularly lose in Mr. Grasé a figure of proved ability.

Marconi Short-Wave Transmitter Type A.D.19.

SHORT WAVE WIRELESS FOR AIRCRAFT

Short wave wireless equipment is particularly suitable for military and naval aircraft. Fixed aerials, giving complete freedom for manœuvring, may be used, and a number of important services may be conducted within a narrow waveband without interference. New short wave aircraft transmitters and receivers, Types A.D.19, A.D.20 and A.D.21, designed by the Marconi Company, combine these advantages with high efficiency, light weight and extreme compactness.

HANDLEY PAGE
AUTOMATIC SLOT CONTROL

"That the slotted wing has been found to be particularly useful in landing in water, is the opinion of the Director of the Provincial Air Service, who contends that a pilot is thus enabled to 'flatten out' ten or more feet above the surface, without resulting damage, in a 'pancake' landing. Among fliers it is generally conceded that unless there is a ripple to serve as a guide, it is practically impossible to judge distance accurately in landing on calm water."

SAFETY. - Actual photograph taken from an accompanying plane of six members of the Royal Air Force jumping simultaneously with IRVIN Air Chutes from Vickers Virginia bombers.

Jump—

----Zip!

IT'S OPEN.—You're safe! Your fall stops in mid air. And then relax. You rest

You glide smoothly, easily groundward, sharing the long-proven confidence of certain safety that Irvin Air Chutes have bred all over the world, in the minds of men who fly—and sometimes jump.

Scores and scores know what a life saver this is, from their own wide experiences in the air.

Already more than 200 aviators have been saved by use of their Irvin Air Chutes when naught else could possibly have brought them safely down.

Among these are aviators in the Air Forces of Great Britain, Japan, Sweden, Denmark, Poland and the Argentine Republic, as well as scores in the United States.

A number indeed have been saved in commercial operations.

Many of the emergencies were of the most extreme nature, and in every case the Irvin Air Chute functioned perfectly.

After thorough investigation and rigid comparative tests, many Governments have adopted the Irvin Air Chute as the standard life-saving equipment for their Air Forces.

If extreme emergency—all unannounced as it usually comes—suddenly confronts you in the air, will you, too, be ready to meet it with Irvin confidence?

Sept. 22.—The Bristol Club's farewell party at Filton.
Sept. 28.—Northamptonshire Aero Club meeting at Sywell.
Oct. 5.—Newcastle Air Pageant at Cramlington, with R.A.F. support.

WARNING TO PILOTS.

A well-meaning correspondent writes:—

One understands that the Air Ministry is taking steps to stop the growing practice of unlicensed pilots flying further than three miles from a recognised aerodrome. Occasional license inspections are to be made at flying meetings. It is probable that such an inspection will be made at Hamble and Cowes during the coming week-end when aircraft are arriving to see the Schneider Contest, so all pilots will be well advised to see that they have licenses which are up to date.

Even if not their own,—presumably.—C. G. G.

AN AERODROME FOR EASTBOURNE.

At a lunch given to Sir Alan Cobham during his visit to Eastbourne in *The Youth of Britain* the Mayor of Eastbourne said that Sir Alan had promised to come to Eastbourne again later in the year to help them to select a suitable site for an aerodrome. He assured his hearers that the aerodrome would not be on the Downs or anywhere near them.

Judging by the local newspapers, there is very considerable opposition in Eastbourne to building an aerodrome on the Downs.

CROYDON NOTES.

A recent distinguished traveller by K.L.M. from Holland was Capt. Kingsford Smith.

K.L.M., like all other firms, is doing extremely well in passengers, considering August is over. This firm made a change of programme on Sept. 2, when two of the four daily services were taken off. So good is the traffic on the London—Holland—Scandinavian line, however, that it may be necessary to call for the new 18-passenger triple-Jupiter Fokker for the London line. This aeroplane is now undergoing flying tests in Holland, of which pilots report extremely well.

Mr. Wilson, more or less as an afterthought, got out his Gipsy-Moth on Saturday last, and flew it with such rapidity and accurate timing to Hadleigh, that he won second prize in the International Rally there.

Of the tenth anniversary of the I.A.T.A. held recently in the Hague, very little was heard. It is supposed that the conference was held in a cellar by candlelight in whispers,—for that terrible fellow Snowden was in the Hague at the time, and liable to turn and rend any inoffensive international conference he happened to notice about the place.

Large men, at first suspected of belonging to the A.I.D., erected a strong brass cage around one of our leading Aerodromites recently, as he sat brooding in his office in the Main Hall. It was the well known Capitano Corko Lino (10d. per mile, laid free of charge) and at first we were unlucky when, ejaculating "Corko caged at last" we hurriedly thrust a small nut between the bars. A cigar, similarly proffered was, however, grabbed with true Zoo zeal, and Capitano Corko unbent and told us all about it. The cage, it appeared, was to protect him from unreasonable customers who, proffering a shilling, demanded twopence change, and insisted on flying a mile in the middle of the night.

If the misunderstanding waxed, Corko Lino expected the brass bars to keep the customer at bay until he got another of his inventions under way. This was a contraption of trap-doors and ladders behind the counter, resembling the companion-way of a ship, which enable Corko to disappear with remarkable suddenness. "The idea came to me," he said modestly, when studying the habits of that eccentric mammal, the Marzipan, which sits at the mouth of its burrow on the boundless veldt until a bit of bother starts in the vicinity, and then, with a derisive cry of "Bung ho!" precipitates itself backwards into security.

Capitano Corko Lino tried out the methods of the Marzipan recently on board s.s. *Savanother*, but found ordinary companion ways had too many knobs on, and his private chute will be lined throughout with sorbo sponge in consequence.

Warned by the dread fate of a certain Italian "monk of great renown," one Father Rosa, we feel a certain delicacy in continuing to jest with the great ones of the Aerodrome. Father Rosa seems to have written in a Jesuit organ comparing Mussolini to Napoleon, whereupon the whole of Italy rang with cries of "Viva Longo Baro Trocadero" and other loud expressions of patriotic zeal.

The good Father, however, tongue in cheek, wrote a second instalment, prophesying the fate of Napoleon for Il Duce. Immediately Mutes with muffled piccolo, played that impressive dirge "O doloroso spaghetti, chianti isoffo" in every town and village, and the monk was obliged to make a quick getaway to Spain.

Certain important-looking little men with magnetic eyes and a tendency to fold their arms across the paunch, have been eyeing us over recently in a manner far from reassuring to one who does not wish to drag out weary years of exile in Balham or the waste places of Wandsworth. Our terror will be well understood when we whisper the dread name "Organ P. Golly."—?.

DISC WHEELS FOR AIRCRAFT.

Aeroplane wheels of the disc type are being tested by the Air Ministry to acquire data on the strength of that type of wheel; also to investigate the various advantages which are claimed for it, such as reduction of weight for equivalent strength and adaptability to the requirements of brake gear, etc.

Wheels suitable for three types of aeroplanes are being supplied, and their behaviour will be observed under different conditions, including service in the Near East.

Mr. E. F. Goodyear, Managing Director of the Dunlop Wheel Works at Coventry, states:—

The experience gained in producing the landing wheels for the Beardmore Inflexible indicated that wire wheel equipment was not capable of meeting the test requirements, and this proved to us that the wire wheel did not represent finality in design and, indeed, in the larger sizes had certain undesirable features and definite limitations.

The disc wheel as we produce it to-day is carefully designed and made and its performance is unquestionable, representing a definite advance in the art. Two important features of any aeroplane wheel are strength and lightness, and in the development of the Dunlop

Digitized by Google

disc wheel comprehensive experiments were made, embodying the use of practically all the commercial light alloys.

The tyre-carrying rim is of novel section and is extruded, the metal being Duralumin. This rim is securely connected to the heavily webbed hub unit by two Duralumin discs, the whole representing a neat and strong wheel, which gives a very satisfactory ratio of strength to weight, particularly in the larger sizes, and in addition affords unique possibilities for housing the brake gear.

A disc wheel weighing 66 lbs. and having a breaking load of 50,000 lbs. compares most favourably with the wire wheel of two years ago which weighed 71 lbs. and sustained a maximum load of 39,000 lbs. The wire wheel of 1926 weighed 81 lbs. and its breaking load was in the region of 28,000 lbs.

A notable advantage of the disc wheel is its capability of bringing a machine safely to rest although the wheel itself may be damaged and distorted by reason of a bad landing, which would have brought about the complete collapse of a wire wheel.

This feature was recently demonstrated satisfactorily with a wheel which had been deliberately buckled. Again, certain possibilities of puncture of the tyre tube are eliminated, as the internal rim surface is smooth and free from the risk of spoke protrusion present in wire wheels under bad landing conditions.

A distinct advantage is gained with the disc wheel through the elimination of the canvas fairings associated with the wire wheel which owing to their tendency to become partially detached are a most troublesome and objectionable feature.

Its shape tends towards a reduction in head resistance, as the brake parts can be snugly housed, a particularly useful feature at a time when breaking systems are attracting the attention of designers. Shorter landing run and control of the machine without external help being of considerable importance, these objects must be obtained with a minimum increase of head resistance.

Aeroplane wheels and tyres are necessary evils and if the aeroplane designer could do without them he would; but, as he has to have them, he likes as little of them as he possibly can. That explains the popularity of our disc wheel which was fitted to a large proportion of the planes on view at the recent Aero Show.

FOR THE FAR EAST.

A first-class seaplane pilot is wanted. He must be quite first-class, he must have a "B" licence, he must have been a seaplane instructor, he must be a hard worker, he must be single, and he must be capable of training pilots on the ground as well as in the air. The salary works out at about £900 per annum, with first-class fare there and back. Applicants can write direct to Mr. R. Vaughan Fowler, The Far East Aviation Co., Asiatic Buildings, Hong Kong, and should send a copy of their application to "C. G. G." at this office.

PERSONAL NOTICES.

Death.

ANDERSON.—On Aug. 23, at Muree, India, David Robin, the beloved elder son of Flt. Lt. and Mrs. David Forgham Anderson, aged three years.

Marriages.

WILKINS—BENNETT.—On Aug. 30, at Cleveland, Ohio, Sir Hubert Wilkins to Miss Suzanne Bennett.

DIMENT—JUDGE.—On Aug. 31, at West Bromwich, Second Lieut. Walter John Diment (late R.A.F.), eldest son of Mr. Walter Diment and the late Mrs. Diment, Wolverhampton, to Ruth, daughter of the late Thomas Judge and Mrs. Judge, Handsworth.

Forthcoming Marriage.

THOMPSON—HILL.—The engagement is announced between Flt. Lt. D. R. W. Thompson, R.A.F., Little Heath, Herts, and Aileen Millicent, daughter of Mrs. and the late Rev. J. Seymour Hill, of Park House, Southwell.

Births.

ALLINSON.—On Aug. 27, at The White House, Mattingley, Hants, to Florence Muriel (*née* Hall), wife of Flg. Off. N. S. Allinson, R.A.F.—a daughter.

CROKE.—On Aug. 28, at 6, Nelson Road, Southsea, to Phyllis, wife of Flt. Lt. L. G. le B. Croke, R.A.F.—a daughter (Susan).

GEORGE.—On Aug. 27, at Caythorpe, Lincoln, to Betty (*née* Baldwin), the wife of Flt. Lt. Robert George, R.A.F.—a son.

HILTON.—On Aug. 27, at 42, The Ridgeway, Kenton, Middlesex, to Alice (*née* Cleghorn), wife of Flt. Lt. L. Massey Hilton, D.F.C., A.F.C., R.A.F.—a son.

PALMER.—On Aug. 28, in Dublin, to Catherine Ann, wife of Flt. Lt. C. Dudley Palmer, late R.A.F., of Rahan, Co. Kildare—a son.

PAXTON.—On Aug. 29, at Netheravon, the wife of Flt. Lt. Anthony Lauderdale Paxton, D.F.C., R.A.F.—a son.

SWOFFER.—On Aug. 26, at Ambury, Cheltenham, to Joan, wife of Flt. Lt. Swoffer, M.B.E., R.A.F.O.—a son.

AIRCRAFT INSTRUMENTS

We have specialised for many years in the manufacture of all types of Aircraft instruments, and only employ specialists in each branch; and our Works are equipped with the most modern plant, machinery and Scientific Test Apparatus. Therefore, we are able to turn out first-class work at very competitive prices; and we guarantee all our deliveries to the time specified.

We would appreciate your enquiries for:—

ALTIMETERS, REVOLUTION INDICATORS, AIR SPEED INDICATORS, CLINOMETERS, AIR AND OIL PRESSURE GAUGES, THERMOMETERS (WATER AND OIL), ETC.

REPAIRS carried out to any make or type of Aircraft instrument, promptly and at a very reasonable cost.

THE ACCURATE RECORDING INSTRUMENT CO., LTD.

Manor Road, TEDDINGTON, Middlesex.

Laboratories and Subsidiary Company for aerial photography in the British Isles Aerofilms Ltd., Colindale Avenue, Hendon (Colindale 6183 and 6184).

THE R.A.F. TROOPING SEASON.

R.A.F. personnel going overseas should advertise their cars, motor-bicycles, wireless sets and other unwanted gear in THE AEROPLANE, where it will be seen by everybody else in the Service, including those posted to the Home Establishment.

AEROPLANE PHOTOGRAPHS.

Copies of Aeroplane Photographs (indicated as such in the inscriptions under the pictures) may be had from:—THE AEROPLANE Office, 175, Piccadilly, London, W.1. Single prints, 6 in. × 8 in. cost 2s. 6d. each, and 1s. 6d. per print for three or more. Larger sizes or larger quantities may be had at special prices.

AIRCRAFT FOR SALE.

Authorised Moth Agents.—Immediate delivery from stock. Demonstrations arranged.—Phillips and Powis Aircraft (Reading) Ltd., Reading Aerodrome. 'Phone Sonning 114. **G-AADC Coupé Gipsy-Moth,** slotted wings. Done 150 hours. Just been overhauled. Complete with two 20 gns. compasses and Hot and Cold air supply and extra large locker. Offers to be made to Capt. W. R. Bailey, Cavalry Club. Machine can be seen and flown Stag Lane.

AIRCRAFT CAMERAS.

"Eagle" Aircraft Cameras and Equipment. Specialists in air photographic apparatus. Particulars from the manufacturers and patentees, Williamson Manufacturing Co., Litchfield Gardens, Willesden Green, London, N.W.10. Telephone 0073-4 Willesden. Telegrams "Kinetogram Willroad London." Contractors to the Admiralty, Air Ministry, War Office.

AIRCRAFT REPAIRS.

No job too small or too large. Complete reconditioning for C. of A. Full certificated staff—keenest rates. Brooklands School of Flying, Brooklands, Byfleet.

FOR SALE.

Mark I Cirrus Engine. Just been completely overhauled. Very highly recommended. What offers? Brooklands School of Flying, Byfleet.

The De Havilland Aircraft Co. Ltd., Stag Lane Aerodrome, Edgware, have for disposal 3 dozen propellers for the Liberty-engined D.H.9a, drawing No. T28925. Offers are invited.

AIRCRAFT WANTED.

Aircraft purchased for cash. Cars taken in exchange for aircraft. Deferred terms.—Phillips and Powis Aircraft (Reading) Ltd., Reading Aerodrome. 'Phone Sonning 114. **Modern aircraft purchased for cash. Part exchanges for new machines.—Brooklands School of Flying Ltd. Telephone Byfleet 437.**

SCHNEIDER TROPHY CONTEST.

Schneider Trophy.—Gentleman will take guests on his 113-ton yacht for the Schneider Cup at either £3 a day or by arrangement. Apply BM/A.S.S., London, W.C.1.

Schneider Trophy Race.—Parking space will be available at Apse Manor Aerodrome, 1 mile N.W. of Shanklin during week of race. Petrol pumps on the spot and also licensed ground staff. Apply Inland Flying Services Ltd., at the Aerodrome.

MISCELLANEOUS.

"Chequers Inn," Slaugham, Board Resident. Golf and coarse fishing half-mile. London 35 miles. Brighton 17 miles. Proprietor.

PATENTS.

STANLEY, POPPLEWELL AND FRANCIS, Chartered Patent Agents, Jessel Chambers, 88, Chancery Lane, W.C.2. Telephone, Holborn 6393; Telegrams, "Notions, London." **Patents and Designs Acts, 1907 to 1928.**—It is hereby notified that the owners of British Patent No. 186353, for "Improvements in or relating to Means for Controlling the Carburetters of Internal Combustion Engines," are prepared to enter into negotiations with interested parties for the sale of the Patent and other British Patents relating to Carburetters, etc. Communications please address to Dicker, Pollak and Mercer, Chartered Patent Agents, 20-23, Holborn, London, E.C.1.

PRACTICAL FLYING.

"A" and "B" Licenses at Reading Aerodrome.—Beautifully situated. First class instruction. Moderate terms. Accommodation.—Phillips and Powis School of Flying, Reading Aerodrome. 'Phone Sonning 114.

BROOKLANDS SCHOOL OF FLYING employs three pilots who have been instructing since 1916. Take advantage of their experience and let them teach you on a Moth or an Avro. Private accommodation on the aerodrome, which is only 50 minutes by rail or road from Waterloo. 'Phone: Byfleet 436-7.

HENDERSON FLYING SCHOOL.—Lt.-Col. Henderson offers unique terms both for "A" and "B" licences. All technical coaching arranged for. Personal attention. Minimum rates. Write to Croydon Aerodrome.

CINQUE PORTS Flying Club (Subsidised) gives cheapest tuition ever offered. Monthly sub. 21s. for 28 days. (No entry fee.) Annual subscription 63s. (entrance 21s.). Moth Equipment—Club-room, Bar and Lawn—Perfect Aerodrome near Folkestone, 1¾ road hours from West-End. No waiting list. Write Secretary, Hythe, Kent.—LEARN AT LYMPNE.

CHEAPEST FLYING IN THE WORLD! at the Norfolk and Norwich Aero Club. Subscription £3 3s. Instruction rates 25s. per hour. Accommodation can be arranged on Aerodrome. Applications to Secretary, Mousehold Aerodrome, Norwich.

Learn to Fly at the Midland Aero Club. Four tuition machines, two fully qualified expert instructors. No waiting. Particulars Hon. Secretary, 22, Villa Road, Handsworth, Birmingham.

Surrey Flying Services, Croydon Aerodrome (Telephone Croydon 1736) have vacancies in their flying school for pupils at moderate rates. Avro aircraft used. Residential accommodation at Aerodrome Hotel.

Southern Aero Club.—Thorough Avro tuition, no waiting list. "B" licences instruction arranged. Apply Secretary, Shoreham Aerodrome, Sussex.

The De Havilland School of Flying, Stag Lane Aerodrome, Edgware, Middlesex. Fourteen machines: Nine Moths, five advanced training machines, Seven Pilot Instructors, Lecture Classes, Restaurant and Recreation Pavilion. The largest and most up-to-date civilian organisation for flying tuition in the British Empire.

SITUATION VACANT.

Experienced Jig and Tool Draughtsman required, with experience in Tooling for Metal Aircraft, including design of dies for draw benches and Rolls special Section Materials. Write stating age, experience and salary required, Box No. 5707, THE AEROPLANE, Cannon House, Pilgrim Street, E.C.4.

SITUATIONS WANTED.

"B" License Pilot requires post, Home or Abroad. Extensive experience. No crash record. Excellent credentials. Previous Eastern experience.—Box No. 5708, THE AEROPLANE, Cannon House, Pilgrim Street, E.C.4.

"B" Licence Pilot requires situation, 1,400 hrs., excellent record.—Apply Box No. 5702, THE AEROPLANE, Cannon House, Pilgrim Street, E.C.4.

Pilot "B" Licence, now free. Good references.—Apply Box No., 5701, THE AEROPLANE, Cannon House, Pilgrim Street, E.C.4.

Pilot-Salesman, can fly any type, over 2,000 hours. Near London preferred.—Apply Box No. 5706, THE AEROPLANE, Cannon House, Pilgrim Street, E.C.4.

TUITION.

We offer sound instruction in Aeroplane Design, Fitting and Riggiing, and Aero-Engine Fitting and Rigging; also expert training for Ground Engineers (Categories A, B, C and D). All tuition is by correspondence. Write to-day for our "Aeronautical Engineering" Booklet. International Correspondence Schools Ltd., 179, International Buildings, Kingsway, London, W.C.2.

ON THE SCHNEIDER SHOW.

Politics.

We are definitely pledged to defend our possession of the Schneider Trophy if and when any other nation challenges us. The pledge was given by the Prime Minister at the official ceremony in the steamship *Orford* after the official banquet after the Contest,—all duly described in detail later in this history. Speaking in that wonderful voice of his, no word of which could be misunderstood, he assured our Italian friends that "We are going to do our level best to win again."

A Benevolent Despotism may be the ideal form of Government, according to political science. But a Limited Socialism in conjunction with a Limited Monarchy seems to be about the best working alternative while humanity remains what it is.

If a Conservative Prime Minister had given such a pledge he might have found himself faced a year or so hence with demands from the Opposition to know how, with our hundreds of thousands, or possibly million or so, unemployed, the Government dared to spend hundreds of thousands of pounds on designing, experimenting, making and operating pure racing machines of no practical value when there were doles to be paid and food to be found for the unemployables of the Nation.

When a Socialist Prime Minister pledges his Government to such expenditure there is nothing much to be said about it by the free and independent voters. Possibly Conservatives may ask in the House why the money is being spent on sport and not on subsidising Imperial air lines or National taxi-ranks. But such querulous voices will be quickly quelled. For the great heart of the Nation is after all in the right spot.

Sir Philip Sassoon was profoundly right when he said that the risk of life and the outlay was justified by the friendly chivalry which such contests as that for the Schneider Trophy produced between nations, and by the friendships which arise between the competing nations.

Commercial.

Apart from all that, there is a cold-blooded commercial justification for the risk and the cost. The War 1914-18 did much to cause a better understanding between nations. We know our Allies better than we did in 1914, and we have a greater respect and admiration for, and a closer understanding of, Germany than we have ever had. But the War delayed the progress of Aviation.

Money was worth nothing and lives were worth nothing. Performance was everything. And we got performance simply by jamming on power regardless of cost. We learned a little of what the human physical machine can stand, and of what metal and wood will stand, but we took no trouble to discover efficiency. And we have done little enough in the ten years since then, as is shown by the fact that the performance of the light aeroplanes of to-day is nothing like as much of an improvement as it should be on the performance of the very elementary light aeroplanes on which people learned to fly between 1910 and 1913. And the performance of our war machines of to-day is very little better than the performance of our war machines of 1917-18. But thanks to the Schneider Trophy Contest and the deceased contests for the Gordon Bennett Cup and the Deutsche Cup we are gradually learning something.

"WE WENT THROUGH FIRE AND THROUGH WATER: BUT THOU BROUGHTEST US OUT INTO A WEALTHY PLACE."

(Psalm lxvi. 12.)

THE WINNING TEAM.—Left to right: Flt. Lt. D'Arcy Greig, Flg. Off. Waghorn (the winner) and Flg. Off. Atcherley (the record-holder for 50 kilometres and 100 kilometres).—(*"Aeroplane" photograph.*)

Digitized by Google

THE PRINCE AND THE BRITISH TEAM.—From left to right: Flg. Off. Waghorn, Flt. Lt. Stainforth, Sq. Ldr. Orlebar, H.R.H. the Prince of Wales, Flt. Lt. Greig, Flg. Off. Atcherley, Wing Cdr. S. W. Smith and Flg. Off. Moon.

KNOWLEDGE.

The one direction in which the greatest progress has been shown in the past ten years is in the increase in speed. Admittedly we have achieved our present quite high speeds by enormous increase of power, but in getting that power our engine designers have learned an immense amount.

The Rolls-Royce R. engine which won the Schneider Contest is said to be giving 1,950 horse power. It is getting it for very low weight. But, what is even more important, it is getting it for a very small frontal area.

No engineer of fifteen or twenty years ago looking at the front end of those Supermarines would have believed that nearly 2,000 horse power could be got into a body of such a small cross-section. And the Napier Lion, although according to its bench tests it gives very much less horse power than the Rolls-Royce, is a very much smaller engine in every way. But it gives horse power proportionate to its weight. And its area has been reduced to a figure so small that if it were made any smaller there would be no room for a man to sit behind it.

That in itself, quite apart from the weight, indicates progress, for the smaller your power plant the less valuable space it will take for whatever purpose it may be used.

PRACTICE.

In air transport speed is more important than anything else. Speed is the one thing which makes air transport worth while. And, to get speed, whatever goes through the air must be made as small as possible.

If we are going to carry mails as fast as possible we must put them into long slim machines which can slip through the air. Though we must necessarily stow the passengers comfortably, if we are going to carry passengers we should have our power-plants inside the area which is necessary for the passengers, so that there must be no added resistance for the said power-plants.

Also our engine-designers have got their weights down to figures which would have seemed impossible even ten years ago. We are very near that coveted 1 lb. per horse power which at present seems to represent the aim and object of the designers of internal-combustion engines. And we have achieved all this chiefly because one nation has been trying for ten years to beat all other nations in speed contests.

One puts all these sordid commercial considerations first because they are most likely to appeal to a nation of shopkeepers, more especially because, with the notable exception of the Supermarine Company, the Gloster Company, and the Napier Company, who, as was remarked last week, have spent a great deal of their own money on building racing aircraft and engines in the past, so few of our aircraft firms have put their hands in their own pockets to any noteworthy extent to improve the breed of aircraft through air-racing, in the same way as the breed of our horses have been improved by racing. No other British firm has built a pure racing machine for the past eight years, with the solitary exception of the Tiger Moth.—And the Trade, as well as the millionaire Modocks, who remember their association

THE PRINCE AND THE ITALIAN TEAM.—From left to right: Lieut. Cadringher, Lieut. Monti, Capt. Canaveri, H.R.H. the Prince of Wales, Lieut.-Col. Bernasconi, Warrant Officer Dal Molin and Serjt. Agello.

British Air Triumphs

1918 A Napier-engined D.H. aeroplane climbed to a height of 30,500 feet in 66 minutes. At this time no human being had ever soared so high.

1919 A Napier-engined D.H. aeroplane won the Aerial Derby. Speed 129·3 m.p.h.

1921 A Napier-engined Gloster aeroplane won the Aerial Derby. Speed 163·4 m.p.h.

1922 A Napier-engined Supermarine flying-boat regained the Schneider Trophy for Great Britain at a speed of 149 m.p.h.

1922 A Napier-engined Gloster aeroplane won the Aerial Derby. Speed 180 m.p.h.

1923 A Napier-engined Gloster aeroplane won the Aerial Derby. Speed 192·4 m.p.h.

1926 The first non-stop crossing of South Atlantic ocean carried out by Commandante Franco, flying a Dornier flying-boat with two Napier engines.

1926 First formation flight from Cairo to Cape Town and back to England. Four Fairey aircraft, each fitted with Napier engine, covered 56,000 engine miles without trouble.

1927 Schneider Trophy won by a Napier-engined Supermarine-Napier seaplane flown by Flight-Lieut. S. N. Webster, A.F.C. Speed 281·669 m.p.h. Only two machines completed the course, both Supermarine-Napier seaplanes fitted with Napier engines.

1927 World's speed record over 100 kilometres set up by Flight-Lieut. S. N. Webster, A.F.C. Speed 283·313 m.p.h.

1928 Flight-Lieut. D. D'Arcy Greig, D.F.C., A.F.C., flying Supermarine-Napier seaplane, fitted with Napier engine, set up speed of 319·57 m.p.h.

1928 Capt. H. S. Broad, flying D.H. Hound, fitted with Napier engine, secured three World's speed records whilst carrying loads of 500 and 1,000 kilogrammes.

1928 The greatest formation flight ever carried out was made with four Supermarine-Napier Southampton flying-boats, each fitted with two Napier engines. The machines flew from England to Australia, round Australia and back to Singapore, covering 180,800 engine miles without mechanical trouble.

1929 The first non-stop flight from England to India was carried out with a Fairey monoplane fitted with Napier engine. 4,130 miles in 50 hrs. 38 mins.

with Aviation only when there is an advertisement to be got cut of it, ought to be ashamed of themselves.

Organisation.

That being that, now let us turn to certain other aspect of this year's Contest. First of all, the Royal Aero Clu does deserve sincere congratulations on the way in whi the whole affair was organised. All our visitors were thusiastic about the whole thing. Americans like Mr. J Ide and Mr. Lester Gardner and Mr. Grover Loening, were in the *Orford,* have all had experience of big Ame air meets and have been concerned with the organis of a good many of them. And they said definitely nothing they had ever seen in the States was quite a as the Aero Club's organisation.

Herr Brandenburg, German Controller of Aviation sistant Herr Hentzen, and Herr von Hoeppner, t President and Secretary-General of the Aero Clu many, who also know just about as much as there about organisation, were equally spontaneousl mentary.

So far as one has been able to check up resu direction, whether it was in the arrangement casting or in the arrangements for the offici in the timekeeping and the transmission o the timekeepers, or the keeping clear of the Navigability Trials (with one sad excepti went with the regularity of clockwork.

Mr. Harold Perrin, the Secretary, and Assistant Secretary, have worked despera the past few weeks over this organisation the thanks and congratulations of eve Never have Mr. Perrin's driving energy imperturbable good nature been tried s have they proved so unbreakable. A achieved such fine results. The only failed, the steamships and railways. range of action

The timekeeping, which was done by and Mr. F. T. Bidlake, was done wit is only achieved by many years of pr ments for the conversion of lap tim per hour, and the transmission of th and/or wireless, worked to perfectio

Even the English weather behave two days before the Contest, and o itself, it was quite perfect. The showers, the wind and the mist at when the Contest had to be postp recollections of that place a dismal with the brilliance of the Solent t

AERO ENGINES

PROGRESS: 2. Weight Reduction

This chart illustrates the result of 14 years progress in Aircraft Engine design technique. It shows the steady improvement given which Rolls-Royce Ltd. have made in power obtained from a weight of material, not only at ground level, but also by the use of a Supercharger, when flying at high altitude.

The whole experience was one of the most heartbreaking affairs that have happened in the competition experience of the British Aircraft Industry. Whether the cause of the trouble will ever be discovered seems doubtful. If it should be discovered, then the information should be published as widely as possible, for no good purpose can be served by keeping it dark while the engine people blame the design of the aeroplane, and the aeroplane people blame the engine.

WHAT EVERYBODY KNOWS.

Everybody knows that there is some subtle difference between the behaviour of an engine on the test bench, and in an aeroplane on the ground, and in an aeroplane in the air. The difference between the running of an engine on a solid test bench, constantly kept cool with fresh water, and driving a dynamometer, is obviously likely to be different from the behaviour of the same engine in a springy structure like an aeroplane. But anybody might imagine that there could be little difference between the behaviour of that engine in the same aeroplane on the ground and in the air.

Naturally the rush of air past the air-intakes of the carburettor must alter the carburation when there is an airscrew running, or when the machine is flying. And this rush of air must create a mixture of air and petrol which is different from the mixture which that same carburettor takes in when the engine is running on a test bench. But when the airscrew is running on the ground one might expect the rush of air from the airscrew to be practically the same as that which is caused by the machine flying through the air. And in fact it is not.

THAT BOW-WAVE.

The reason for this would seem to be that when the machine is stationary and the airscrew is pushing the air back it does not create a definite bow-wave round the nose of the engine such as is made by the machine rushing through the air. That is to say, when the machine is stationary on the ground the airscrew has to suck the air towards itself, and it then pushes it back in a way which may actually cause what may be best, if unscientifically, described as a "partial vacuum" round the airscrew-boss and the nose of the machine, so that no bow-wave is thrown out, whereas when the machine is flying, especially at these very high speeds, there is enormous pressure on the actual airscrew boss, and quite a different air-flow over the nose of the machine.

Consequently an air-intake which may seem to be quite correctly placed when the engine is running in the aeroplane on the ground may prove to be quite incorrectly placed when it is in the air because of the different direction of the bow-wave.

Added to this there is the further complication that all our new racing engines are supercharged, and when the supercharger is running, if the bow wave throws the air out past the mouth of the air intake, then the supercharger is being starved because obviously with a supercharger more air must be sucked through the intake than would be needed if the engine depended on its own natural suction.

Probably these suggestions are every bit as inaccurate as all the suggestions which have been made by all the experts down at Calshot in their efforts to find the trouble. But at any rate the failure of all the experts to locate the trouble does seem to indicate that the bow-wave has something to do with the difference in the carburation with the engine running on the ground and when it is in the air.

Every time the machine has come in the engine people and the aeroplane people have been quite sure that they have located the trouble. When all hope of getting the machine into the Contest was given up on Friday morning, they were all equally certain that they had found the cause of the trouble and that they would be able to go for the Speed Record this week. One hopes most sincerely that they have located it at last. But on the other hand one will not be in the least surprised if they have failed to do so. One can only wish them the best of luck.

At least everybody must congratulate the engineers who have worked on those machines during the whole of last week as nobody could have worked unless spurred on by the finest sporting spirit. No other inducement could have produced such work. Nothing in the way of overtime pay or hope of personal advancement could have put such energy into men. It could only have come from their innate sportsmanship. And for that they deserve just as high commendation as has been poured forth on the winner of the Contest himself.

THE LESSON.

The only lesson to be learned is that putting things off till the last moment is sheer folly. We have been so afraid of having engines and machines ready a little bit too soon, humbugging ourselves with the idea that if we did so our competitors might get wind of our designs or of our mechanical processes, that we have put things off too late.

If the engines had been ready six months ago and if the machines had been ready for the engines at the same time, and if they had been flown, let us say, in June, and this trouble had then disclosed itself, there might have been some hope of discovering the cause of it. But of course if the machines and engines had been ready and had been flown in June, and if the Italian machines had been ready and had been flown in June, then we might each have learned something about the other's machines and we might have copied something from the Italians and they might have copied something from us, and then we both might have altered our machines accordingly and we should probably both have made a mess of them.

[Note the Object of the Excitement in the Right-Hand Top Corner.]

A LONG SHOT.—Warrant Officer dal Molin getting off in the tests on Friday—("Aeroplane" photograph.)

All the same, personally one is perfectly certain that on a job of this sort the proper thing to do is to have the engines and the machines ready and actually flying a good four months before the Contest. There are always little things that can be done in the way of tuning, and minor alterations which can be made which will add just the odd fraction of a mile an hour which makes the difference between winning and losing.

As Mr. Ramsay MacDonald has pledged us to defend the Trophy, and as General Balbo has practically challenged us to compete again two years hence, for goodness sake let us start work now, and let us arrange to have our machines in the air in June 1931. That only gives us a bare twenty-one months for the job, and it is none too much.

THE GENERAL IDEA.

So much for the general aspect of the affair. Let us now turn to the Contest itself. Actually this began on Friday when the machines had to pass tests which were supposed to prove their airworthiness and seaworthiness.

As there are so many phases of the Contest the description has been split up between various members of the Staff of this paper so that readers may get a general idea of how it was seen from many different points of view.

Mrs. McAlery, as befits one whose existence is devoted to the Royal Air Force, chose to represent The Aeroplane at Calshot Air Station on Friday afternoon and Saturday. Her description will be read with particular interest because it is so essentially the point of view of the R.A.F. itself.

Mr. Thurstan James chose to go seafaring with some friends and see the Contest from the Western turning point, where he had an excellent opportunity of observing the working of that curious institution, the Marine Mind, which played such an important part in the whole show right away from the qualifying tests up to the moment when the élite of British Aviation went ashore.

Mr. Leonard Bridgman watched the performance from the *Orford*, and gives his impressions of a life on the Solent wave.

Mr. Norton had perforce to stay at home, and gives his view of the affair as received on the wireless.

Mr. Geoffrey Dorman, being cumbered with much advertising, gives an impression of the affair from the advertiser's point of view.

Interspersed among them all are the excellent photographs of Mr. C. A. Sims, whose work is rapidly becoming World-famous.

For oneself, one was concerned in the naval manœuvres connected with the qualifying tests on Friday, and thereafter one was plunged into the social vortex in the *Orford*. As the said naval manœuvres began the actual contest let us begin with them.

NAVAL MANŒUVRES.

By C. G. G.

The Prohibited Area.

On Friday morning, Sept. 6, certain members of the staff of The Aeroplane rose before dawn to take a hand in those naval manœuvres which are euphemistically called Navigability Tests, by the competitors in the Schneider Trophy Contest. As described in The Aeroplane last week, each competitor before flying in the Contest has to take his machine off the water, fly round a given course of something between 5 and 10 miles, alight, taxi between two marks on the water, get off, fly round, and alight again. There are three of these flights and three alightings to be done. After that the machine is moored out for six hours, and if it has not sunk by then, it is passed as fit to fly next day.

We were warned that the machines might leave Calshot soon after 06.00 hours. We arrived. We waited. And then we waited some more. The Marine Mind affects even the water-borne section of the Royal Air Force.

Somewhere around 07.30 hours the three Italian machines and the three British machines were towed out to their floats, and in them were towed off to the middle of the Solent to a point roughly midway on a line due north from Cowes. For the purposes of the trials a course, in which all traffic was prohibited, was kept clear, so that the machines might do their taxi-ing tests and alighting tests without fear of obstruction. The limit of this prohibited area was a ship of His Majesty's Navy called the *Medea*, whose purpose in life otherwise was not very apparent.

Having acquired marine habits ourselves, we hung around Calshot until the official Press-boat, full of photographers and journalists, had gone off to lay up, or ride to her moorings, or drop anchor, or sling her hook, or swing the lead, or whatever the proper marine phrase may be, somewhere ahead of the *Medea*—but how they discovered which was ahead and which was astern must have been quite difficult, for the *Medea* seems to have but little difference between the blunt end and the sharp end.

Thanks to the loving-kindness of Mr. Harold Perrin, a delightful little motor yacht, the owner of which had sportingly volunteered to do any services required of him, was told off to take us to the borders of the Prohibited Area.

When We Put Forth to Sea.

She was a delightful boat—a very good sea-boat—and her owner-driver was, and one hopes is, a amateur sea-faring gentleman of the most affable. But the boat had two engines. The port engine refused to run, and the starboard engine stopped every now and then.

The first thing we struck—that is the word—in our voyage were two large motor vessels of some kind belonging to the R.A.F. One was full of doctors and flew a Red Cross flag, and the other told us it was a salvage vessel. So we felt that if there was going to be a crash there would be some hope

THE TESTS.—Flt. Lt. Greig starting. Lt. Monti's machine on the lighter.—("Aeroplane" photograph.)

of first-aid being taken to the pilot within a very few hours of the accident. For one could not expect the Marine Mind to act more quickly.—Doubtless you realise that the Marine Mind has no conception of Time and very little of Space—transport over oceans has that effect on those who follow the sea on their lawful occasions.

These two vessels had hitched their head-ropes to the banisters of the Calshot lightship, and the personnel seemed perfectly happy lying in the sun smoking.

When we had seen Mr. Waghorn do his tests we came to the conclusion that there was not going to much fun at our end of the area, so we went on several miles further to where the *Medea* and a number of yachts and motor-boats were anchored. As there were motor-boats with female spectators in them tied up to both ends of the *Medea*, we were not very sure what part of the vessel really represented the boundary of the prohibited area, and assumed that it was one side of her, as there were no boats there.

NOT UNDER CONTROL.

At that time neither of our engines was feeling very well, so we drifted with the tide and with the wind a little astern of a boatful of spectators which was tied up to the *Medea*, and let go our anchor. Whether our chain was not long enough, or our anchor was not heavy enough, or the mud was not sticky enough, one did not bother to inquire. But anyhow, we continued to drift.

While we were doing so Mr. Atcherley very kindly did some excellent alightings quite close to us, of which Mr. C. A. Sims managed to get some quite good pictures. As may be seen, they were quite uneventful, and from a purely aeronautical point of view this part of the proceedings was deadly dull.

While we were thinking how kind Mr. Atcherley was, a speed-boat dashed up commanded by Lt.-Col. Bristow complete with seafaring cap, yellow oilskins, American spectacles, and military moustache, and besought us by all his gods to go away, because if we did not he would get into trouble.

Loving Colonel Bristow like a brother, we tried to induce the owner-skipper to up-anchor and away. But he then discovered that though his anchor would not hold, he could not get it up, because one quite imbecile member of his crew had dropped one handle of his winch overboard, and the other was not big enough to heave the anchor. And meanwhile the anchor was dragging.

So both members of the crew got hold of the chain, and after a lot of trying, man-handled it up. During this period of our voyage the R.A.F. Police-boat, carrying the Lord High Provost-Marshal of the Royal Air Force, came tearing over to us and told us to get out—surprisingly politely under the circumstances.

We pleaded plaintively that the owner and his crew were doing their best, but that the tide was too much for them and that the mud was not enough. And then Col. Bristow reappeared and tried to chase the Police-boat away, because in chasing us the Police-boat, which is, in private life, really a motor yacht belonging to Sir Guy Granet, had also got well into the Area, and Col. Bristow thought that it also was a law-breaker.

While all this argument was going on, Flt. Lt. D'Arcy Greig and one of the Italian machines proceeded to do some close-up work for our benefit.

HOMEWARD BOUND.

Finally we hove up our anchor and got under way and steamed, or rather petrolled, up among the rest of the shipping, where, thanks to the eccentricities of the engine—that is to say, the one which kept running—and the fact that the crew and the skipper were both so engrossed with the engines that they slightly miscalculated the effects of wind and tide, we very nearly rammed the R.A.F. flag-ship, and we did definitely collide with another R.A.F. vessel on which one recognised Sir Henry Segrave, and was recognised by him. Even that recognition failed to make one blush, for by this time one was past all sense of shame and was merely suffering internal agonies through trying not to laugh openly at the efforts and gyrations of our amiable skipper and his crew.

No doubt if this kind of thing had gone on much longer we should have been sunk by gun-fire from the *Medea*, or we should have been rammed by the police-boat, and arrested when rescued from the water, or perchance we might have been taken in tow by some friendly plutocrat of the Aircraft Industry, whose expensive motor-boats and yachts were lying around in profusion. But happily our right-hand engine did consent to work, and so we stole quietly back towards Calshot—with our painter between our screws, as it were.

After we had been going for about five minutes we were overhauled by a speed-boat with several R.A.F. officers in it. We quite made up our minds that we were going to be put under arrest, but when they came alongside we found they proved to be friendlies, and that all the trouble was

GETTING DOWN TO IT.—Mr. Atcherley doing his last test alighting.—(*"Aeroplane" photograph.*)

that one wanted a lift back to Calshot. He happened to hold an important position on the Station. He came with us trustingly, little knowing that we held him as hostage against being sunk by bombs when we came along under the pier head. And so we escaped back to dry land—leaving skipper and crew to their fate

Back to the Land.

We learned next day that the same motor yacht distinguished itself still more on Saturday. It had been gyrating out in Southampton Water, and for some reason came across the pier-head at Calshot. At that moment one of our competing aircraft was being let down the slip-way to its float. As the boat came past the end of the pier those on the pier-head shouted loudly a warning about the machine on the slip-way just ahead.

The skipper, complete with crew, looked up to the pier-head to see what all the noise was about, and the boat, under its own control, ran good and hard aground on the slip-way. Fortunately the aircraft was so far up the slip-way that it was not touched, and the motor-boat which was to tow it out to the float had not come to the slip-way. But if the machine had actually been in the water, as it would have been a minute or so later, it would have been rammed by the yacht.

Mr. Moon of the R.A.F. team contemplated removing the yacht with dynamite. The Admiral of the R.A.F. Fleet considered towing it off by putting at least three R.A.F. launches onto the job at once. Happily the tide happened to be rising and a few of the stronger members of the R.A.F. beach-party pushed the thing into the water again, and it was cast forth with contumely from the precincts of Calshot.

The British Navy.

So far as we of The Aeroplane were concerned, we were far away when this unfortunate affair of Saturday morning happened. And our escape from the prohibited area on Friday morning passed unnoticed by all the R.A.F. people, and the police-boat and Col. Bristow, because while we were having our own little private collisions, a vast ship came down the Solent from the direction of Ryde and steamed very slowly with immense solemnity slap across the whole of the prohibited area.

One of the Italian machines having circled round by Cowes, was coming down to alight, when the pilot saw several hundreds of yards of huge grey mass right across his course. He opened up his engine, turned round again over the Isle of Wight, and aimed his alighting past the hind-end of the ship—so luckily no regrettable incident occurred so far as he was concerned. But the language of the R.A.F. was distinctly regrettable.

The real joke turned out to be that the offending ship which had disobeyed all the orders of the local Admiral to keep the course clear for the Navigability Trials of the Schneider machines was the Flagship of the said Admiral himself, H.M.S. *Iron Duke*. Serious comment on the incident would be unprintable, and any attempt to be humorous would merely spoil what is in fact just about the funniest story that has ever happened to the sea-going side of the R.A.F.—But it might have been a tragedy.

THE OBSTRUCTIONIST.—H.M.S. "Iron Duke," well in the fairway, with Lt. Monti alighting past her stern.

HOMEWARD BOUND.—Warrant Officer dal Molin after his tests. —(" *Aeroplane* " *photograph.*)

AT CALSHOT.

By C. M. McALERY.

The tumult and the shouting died with the departure of the Royal Aero Club officials from Calshot at 13.00 hours on Friday, Sept. 6. The three blue and silver Supermarines and the three scarlet Macchis, conscious of their duty done and tests well passed, lay at their moorings rising and falling gently on the swell of passing craft. The population adjourned to lunch, and Calshot was itself again.

The navigability trials ended in the following order and times: No. 2 Supermarine-Rolls-Royce S.6 (Flg. Off. Waghorn), 09.41 hours; No. 4 Macchi 52 bis (Warrant Officer dal Molin), 10.00 hours; No. 5 Supermarine-Napier S.5 (Flt. Lt. Greig), 10.20 hours; No. 7 Macchi 67 (Tenente Cadringher), 11.51 hours; No. 8 Supermarine-Rolls-Royce S.6 (Flg. Off. Atcherley), 11.12 hours; No. 10 Macchi 67 (Tenente Monti), 10.57 hours.

During the six hours that the machines were moored out for the Watertightness test, each member of the selected team went up for a last look at the course. Mr. Waghorn went first, and when he alighted again Flt. Lt. Greig took the same Flycatcher over the course. In the meantime, Mr. Atcherley took up a second Flycatcher, and after flying round the course, he treated the spectators at Calshot and on the ships in the vicinity to a delightful and hair-raising display of aerobatics. He looped and rolled and spun the Flycatcher in masterly style, and finished up the display by diving down and flying between two liners, the *Montcalm* and the *Olympic*, which were passing each other just off Calshot Spit at the time—which must have larned them to be liners.

The visiting aircraft moored out off Calshot during the day included the Italian Savoia flying-boat, a Junkers seaplane, and two R.A.F. flying-boats from Cattewater. The Dornier Do.*x* had intended to be present, but such poor moorings were offered to her to see the race that she sulkily refused to be present. The rumour that the Prince of Wales was flying in the Saro Cutty-Sark was not confirmed, although she was seen cruising about in and over Southampton Water on the following Sunday.

Distinguished visitors at Calshot during the day included Marshal of the Royal Air Force Sir Hugh Trenchard and Lady Trenchard, Lord Thomson, Mr. Ramsay MacDonald and Miss MacDonald, the French high-speed team, who would have been competitors if their machines had been ready, and the officers of an Italian destroyer lying off Cowes.

One of the Gloster-Napier machines was brought out of her shed and the engine was run up, but things were not satisfactory, and she was taken in again.

When the Watertightness tests were completed the competitors were towed in and put to bed for the night. The rest of the evening was spent in gossip, the consumption of long drinks, and other harmless occupations. Certain evil-minded people got an enormous amount of amusement out of the discomfiture of some of the Italian visitors, caused by the inaccurate translation of one of the notices on the camp into Italian.

Accommodation round Calshot was rather strained, and a member of the staff of THE AEROPLANE who slept in a greenhouse and was annoyed in the early morning by bumblebees, was haunted by a nightmare of being chased round Heaven by a Macchi made of tomatoes mounted on cucumber floats.

THE GREAT DAY.

Most of the morning of the contest was taken up in getting the machines onto their pontoons and towing them to the starting base.

The Italian machines had been run up overnight, and without any delay whatever they were shoved down the runway, taken in tow, and all three neatly packed onto one pontoon. The Supermarines were run up in turn on the station before being towed out and put each on to its own pontoon. The pilots sat around, wisely taking no interest in the machines, and trying hard to dodge the attentions of the Press photographers.

The real excitement was watching the operations and manœuvres of the Southampton Harbour Board officials, who have a jetty and hut at Calshot. The duty of these officials was to attempt to prevent passing ships from washing the aircraft off the slips and floats. They had a flag flying which indicated in international code that all passing ships must reduce speed

Many of these ships, through ignorance or cussedness, turned a blind eye, with the result that the Harbour Board officials, who are the self-appointed father and mother of all Schneider aircraft, worked themselves into a perfect frenzy of international indignation. Semaphore flags wagged unceasingly saying all sorts of rude things in their own code, and when even that failed, the voice of the highest official was raised in a mighty roar of wrath. One bellow which must have been heard from Gilkicker to Cowes said: *Prince of Wales*—reduce speed!!!" A rush to witness the result of this exhibition of *lèse-majesté* saw the Cowes ferry, packed with trippers, humbly reducing speed.

While most of the Press representatives and other spectators were having lunch, the British team slipped away to the starting base in a lighter, followed shortly afterwards

THE LAST TEST.—The two teams moored out for six hours on Friday. —(" *Aeroplane* " *photograph.*)

Digitized by Google

DOWN!—Flt. Lt. D'Arcy Greig alighting.—(*"Aeroplane" photograph.*)

by the Italian team. Thus those who were ready with advice and bouquets were neatly thwarted.

The starting base could be seen quite clearly from Calshot marked by the Naval mine-sweeper *Medea,* which was acting as a wireless communication ship during the contest. Although the competitors took off away from Calshot, they could be seen the whole time they were on the water, and for several seconds after they got in the air, with the naked eye from any point at Calshot. In the air we could see them coming over Gilkicker, down the course to Cowes, round the Cowes turning-point, and away to Ryde again.

Enormous amusement was afforded to the spectators by the R.A.F. patrol-boats, which were keeping the course clear. Tugs, herring-boats, and assorted craft controlled by holiday-makers, tried to get into what appeared to be a nice, clear, lonely patch of water, only to be chased off by infuriated Air Force speed-boats which raced up, described the ancestry of the occupants of the offending craft through a megaphone, and circled round them until they practically sank themselves with shame.

All the plutocrats on S.S. *Orford* and Ryde Pier missed the take-off of the machines, which was some of the most exciting part of the day's racing. Each competitor had a quarter of an hour to get over the starting line at Ryde after the firing of the gun at the starting-base. They all got away without any delay. The veteran Supermarine-Napier S.5 took off with the shortest run, and the old Macchi took very little more. All the others seemed to the anxious watchers as if they would never unstick. As a matter of fact, they each took about 32 seconds—but it seemed years.

THE CONTEST FROM CALSHOT.

Mr. Waghorn, the first away, flew a beautiful course. His cornering at the Cowes turn was perfect, and he did not seem to lose a second. A good many people at Calshot miscounted the laps, as he did himself, and moans of anguish went up when he was seen to leave the course and alight between Cowes and Ryde. He had forgotten to break the paper over one hole of his lap-counter, and was on his eighth lap when he ran out of petrol and came down. He was still unconscious of his mistake when he was picked up by the towing-boat, and had to be told that he had finished the course.

Warrant Officer dal Molin, in the old Macchi, was next away, and there was a thrilling moment when Mr. Waghorn overtook and passed him on the Cowes-Ryde leg of the course

Flt. Lt. Greig, on the old S.5, followed, and went round the course like a well-tried piece of machinery. His lap-times were so consistent that he must have flown a perfect course with his engine practically full out the whole way. He circled over Calshot twice before alighting, and then put the machine down alongside its tender.

Tenente Cadringher overshot the Cowes turn by so wide a margin that he must have lost a lot of time on his first and only completed lap. The second time round he left the course and came down. He made a good landing, in spite of the fact that he was almost overcome by the fumes from the exhaust.

By the time that the gun went for Mr. Atcherley's start, the wind had freshened, and he met a considerable swell, with the result that the machine porpoised badly at the beginning of her run. But he got her under control again and took off beautifully. Everybody expected him to beat Mr. Waghorn's time, because Mr. Waghorn had instructions

FIRST

CONGRATULATIONS to Flg. Off. H. R. D. Waghorn, the Supermarine Aviation Co. Ltd., and Messrs. Rolls Royce Ltd. on their splendid achievement in winning the Trophy again for Great Britain.

The result has conclusively shown to what heights British Airmanship, British Aeronautical design and British steels can reach.

Naturally we are glad to have added our quota to their success in the event by being responsible for the Special Alloy Steels from which the following engine and machine components were made.

Connecting Rods	**Crankcase Bolts**	**Cylinder Studs**
Propeller Shaft	**Main Reduction Gears**	**Main Reduction Pinions**
Camshaft	**Supercharged Gears**	**Pump Drive Shaft**
Valves	**Valve Springs**	***Cowling Fastenings**
***Combined Fin and Oil Cooler**		***Y-Couplings to Water System**

Spar Coupling Hinge Fittings (S.62B)

**These parts made from FIRTH STAYBRITE STEEL (DTD42).*

THOS. FIRTH & SONS, LTD., SHEFFIELD.

("Aeroplane" photograph.)

to nurse his engine to make sure of completing the course. Having seen Mr. Waghorn safely over the course, Mr. Atcherley could let his go practically all out, and, therefore, when the broadcast announcement gave the first lap as at 302 m.p.h., everybody knew that something was wrong. What actually happened was that he had lost his goggles and mistaken one of the turning-points. He was still racing round the course when the news came through that he had been disqualified.

The last man away was Tenente Monti, in the second Macchi 67. After doing one lap of the course at 301 m.p.h., he failed to appear over Gilkicker. After a few minutes of anxiety the news came through that he was down off Hayling Island with a broken oil-pipe. Tenente Monti was rather badly scalded on his arms and legs, and directly he was landed he was rushed up to the Station Sick Quarters in the ambulance. He was so far recovered the following day that, to everybody's delight, he was cheerfully playing the drum in the volunteer dance-band in the Mess.

THE RETURN OF THE CONQUERORS.

The British team were only just ashore when H.R.H. the Prince of Wales arrived in a motor-boat and jumped on to the pier to congratulate them. He talked to Sq.-Ldr. Orlebar and the rest of the team for a few minutes, and then went away again.

His departure let loose the hordes of Press photographers and movietone operators who followed the team about and surrounded them every time they stopped. The scene was best described by an aircraftman who was overheard to say: "Just as if they were waiting for rats to come out of a hole."

Shortly after the teams had landed, Squadron Leader Orlebar granted an interview to the assembled representatives of the Press, an act of courtesy for which one hopes they were duly grateful.

Sq. Ldr. Orlebar said that he believed the Press wanted to know what the pilots said to him after the race was over. After the usual congratulations they had all said how grateful they were for the work that had been done for them by the three companies concerned in the manufacture of the machines, the Supermarine Company, the Rolls-Royce Company, and the Napier Company. They fully realised

that these people had worked day and night to get the machines ready.

The pilots had included in their thanks the N.C.O.'s and men of their own Flight, who had been working with the firms' employees since they came to Calshot, and had also, for the past eight months, kept the practice machines in working order—this last no child's play.

With regard to the individual experiences of the three pilots who had flown in the race, Mr. Waghorn's machine had taken off and lapped perfectly. The engine had run extremely well. The course had been excellently marked. The pilots had, naturally, felt very hot, but the ventilators which had been fitted the previous night on the combined suggestion of Waghorn and Atcherley had proved most effective in diminishing the discomfort of flying these machines on such a hot day.

All three pilots had used a lap-indicator consisting of a board with eight holes in it with paper pasted behind each hole. The pilots had to break the paper over one hole as they crossed the starting line, and over the other holes at the start of each lap. All three pilots had broken the one marked "Finish." [Subdued hum of congratulation from the Press.]

Waghorn had not been absolutely certain that he had done his seventh lap, and did three-quarters of another lap when he ran out of petrol. He had landed perfectly satisfactorily on the leg of the course between Cowes and Ryde.

Flt. Lt. Greig's machine had behaved beautifully—in which connection it was interesting to note that this was the first time that Greig had taken it off with full load. The S.5 was now well over two years old, and yet it had lapped at just over Flt. Lt. Webster's speed at Venice, which had been 282.11. Another point of interest had been the remarkable consistency of Greig's lap times, which had only varied from 283.73 to 281.16 the whole way. The rev-counter drive had broken on this machine, and Greig had lost the cotton-wool out of his right ear, and was consequently somewhat deaf.

Mr. Atcherley had been disqualified for missing one of the turns. He (Sq. Ldr. Orlebar) had lodged a protest. Dur-

THE ITALIAN TEAM.—The two Macchi 67s and the Macchi 52 on their lighter.

ing the first lap Atcherley's goggles had got oiled up and he had pushed them up and then looked out to see where he was, and lost them. Each pilot wore a second pair round his neck, but before Atcherley could put them on he had passed the turn.

Atcherley's machine had hit a little rough water just after opening out and had porpoised slightly, but had recovered. He had landed in front of the pontoons, as previously arranged.

Sq. Ldr. Orlebar then invited the Press representatives to ask questions, and, with the mercilessness of their kind, which takes no regard to the obvious tiredness and boredom of its victoms, they did so. Replying to these, Sq. Ldr. Orlebar said that none of the pilots had experienced any "black-out" on the turns (owing to centrifugal force taking the blood from their brains).

Atcherley had been disqualified for not rounding the turn at Bembridge. If the disqualification was not upheld, he would be placed second in the contest.

He could not tell the Press exactly what the Prince of Wales had said to the pilots, but he had discussed the race and the machines and had said that it was a jolly good show. [When asked by Sq. Ldr. Orlebar in a penetrating roar what the Prince of Wales had said to him, Flt. Lt. Greig said that he hadn't the faintest idea.]

Waghorn had established a new record for the 100 kilometres on his second and third laps, when he had averaged 330.32 m.p.h. This record had then been broken by Atcherley, who had averaged 331.75 m.p.h. on his sixth and seventh laps.

Finally Sq. Ldr. Orlebar said that as Captain of the Team he would like to record his appreciation of the work of the Team, of the firms who had made the machines and the engines, and of the whole personnel of this great Flight.

AT THE SHARPEST BEND.

BY THURSTAN JAMES.

A party of enthusiasts, among whom was this humble chronicler, left London in the very small hours of Saturday morning for the first stage of the journey to Cowes. After a long period of stoicism the party found itself on board a motor-boat and cruising round the Solent.

Cowes Roads must have been one of the prettiest pictures in the world that morning—with the clear sky, the brilliant sun, and ever-changing water all conspiring to make the yachts, launches, and even barges, look their very best. Of all the contraptions made by man, ships and boats, even speed-boats, approach nearest to having a soul of their own, and that must be why a collection of craft swinging at their moorings in brilliant sun makes such a perfect picture.

Just before the Contest the S.S. *Ranchi* swung into position to the west of the turning pylon off Cowes. As the anchors rattled down, a multitude of flags were broken from the rigging as the ship was dressed. All the boats in Cowes Roads were similarly decorated, and the multi-

AWAY!—Lt. Cadringher starting in the Contest.

coloured scraps of bunting added even more colour to an already vivid picture.

Up the Medina by the sheds of Saunders-Roe, Ltd., were the only sea-going visiting aircraft visible, a Dornier-Wal and a Junkers F.13 on floats.

The chronicler's party cruised round and about, had a look at the *Argus*, and decided they had never seen a ship with so many stove-pipes and chimneys before. They wondered whether everybody had a private stove or geyser-bath.

The *Iron Duke* seemed well and cheerful, the crew were noticed to be smiling, so it was presumed that effect of the rebuke administered by *The Daily Express* and by others in authority over us had worn off.

By this time the official hour for complete immobility was drawing nigh, so a course was set for the Gurnard Anchorage. This anchorage, it must be explained, is off West Cowes, and offered the closest anchorage to the sharpest bend in the Contest, namely, the turn around the markship off West Cowes. After avoiding large numbers of speed-boats and other dangerous craft, the mooring place was reached and the anchor dropped.

In the middle of lunch, a patrol-boat arrived, and the sub-sub-sub-midshipmite (this must have been his rank, because of his subsequent misbehaviour) insisted on our boat being moved. This was a great pity, because it induced a positive passion in our craft for shifting from one spot to another, and also because the midshipmite carefully refrained from moving a larger craft with some of his girl-friends aboard. Luckily the chronicler has a personal providence who was no doubt responsible for the midshipmite's subsequent eclipse.

When the tumult and the shouting had died and the Captains and the Midshipmite had departed, it was nearly two o'clock, and one believed that the starting gun was heard. But it may have been our crew saying what it felt about patrol-boats.

A dark object was seen moving along the yellow shore by Lee-on-Solent, and before an acrimonious discussion as to whether or no it was Flg. Off. Waghorn had resolved into blows, the speck lifted and, climbing at incredible speed, shot away for Ryde.

Then there was a hush as everyone gazed over towards the *Argus* and waited for the first black smudge that should be the machine. There it was, past the *Argus*, past the *Iron Duke*, across the open water, and here one bent down for the camera. Getting up, one looked for the machine, and was startled not to see it, though the roar got louder and louder. Of course, sound travels slowly by comparison now-a-days, and one has to look miles ahead of the noise.

Mr. Waghorn on No. 2, the first Supermarine Rolls-Royce S.6, started his turn before he got to the mark-ship, did a climbing turn, and dived down upon the Gurnard anchorage, straightened out, and streaked away down to Ryde. He left behind a roar that faded away, leaving an impression of incredible engine-power.

Mr. Waghorn's next turn was wider and right over-head. Seen from beneath, the S.6 looks short, much shorter than it does in side elevation. This must be due to the long floats dwarfing the fuselage and wing-span.

The third turn was tighter and nearer the water.

Owing to, shall we say, a hitch in the organisation, there was no wireless aboard our craft, and we did not know that Mr. Waghorn was shattering records with every lap. But twenty minutes had now elapsed, and a red streak could be seen along the Lee Shore (no pun here). This was Warrant Officer dal Molin on the Macchi 52 bis.

Mr. Waghorn again came round, and so accustomed had we become to the fantastic speed that we looked forward to the arrival of the Macchi, though we know it to be miles an hour slower.

Mr. Waghorn's fifth turn and Sgr. dal Molin's first made

The Silent Service, becoming vocal, shepherds the Air-Minded

Digitized by Google

the best moment of the day at the Cowes' bend. The Italian flew fast and low along the water, behind and above came the S.6. They rounded the bend together, one above and one below. They straightened out and were past, the silver and blue S.6 pulling inside to clear the scarlet Macchi, and there they were, past Old Castle Point and out of sight.

Mr. Waghorn was soon back again on his sixth turn, followed some while after by the Macchi on its second turn. This old Macchi was certainly the quietest machine in the race.

Mr. Waghorn dived past on his last lap, and we wondered at the amazing regularity with which he appeared, cornered and flashed past.

The Macchi 52 bis did its third turn, and then its fourth flying low and making consistently tight turns.

At this moment our crew discovered the motor-boat to be dragging its anchor fast, and attempts to start the engine caused such a diversion that the take-off of Flt. Lt. D'Arcy Greig passed unnoticed. He soon appeared in the S.5, and we all noticed the different engine-sound and much lower speed. His turn was near the water and of small radius.

Then Mr. Waghorn appeared with the engine off and the machine coming down. The S.6 appeared to have adopted the habits of the autogiro or slotted Moth, for it was obviously the slowest of all slow aeroplanes. This must have been relativity, because the S.6 stalls somewhere about 80 m.p.h., though that is a very low figure for such a fast machine.

The fifth appearance of Sgr. dal Molin was the signal for a spot more trouble with our anchor, but we managed to notice his passing. Apropos of anchors, one should point out that the tide swept over the Gurnard anchorage as a river about to fall over a cliff like Niagara.

The S.5 completed its second turn, followed by Sgr. dal Molin on his sixth, then the S.5 on its third, and finally the Macchi 52 bis on its seventh and last.

Coming down the water, and silhouetted against the yellow shore, we now saw Lt. Cadringher on the new Macchi 67. He took off and, flying high, crossed Flt. Lt. D'Arcy Greig on the S.5.

Flt. Lt. Greig then arrived, and completed the turn with his usual and unvaried close turn. The engine popped three or four times, and then continued its steady roar. We noticed that, with the exception of the final and seventh turn, the engine in the S.5 gave several pops or misses every time the machine rounded the bend. This machine was the only one in which we noticed this phenomenon.

Lt. Cadringher then arrived on his Macchi 67. This machine could be traced travelling low and fast all the way from Southsea, but it was evident that there was going to be trouble, and there was. The Macchi did not appear to bank until it had passed the mark-boat, and then it seemed to skid with one wing down. Slowly the craft came round and passed between us and the shore. We all thought a crash amongst the masts of the shipping was imminent. Besides the roar of the engine, there was an angry menacing scream not noticed on any of the other craft.

The Macchi tore across the estuary, lifted just in time to clear the hill above Old Castle Point, and dived down out of view. Somewhat relieved, we turned our attention seawards.

Much shouting then arose, and the patrol-boat in charge of the midshipmite was seen to be very much in distress and quite out of control. This patrol boat, whose number shall be kept a close secret, drifted down with appalling velocity onto a perfectly good racing yacht of large dimensions and hit it with a loud crash, tore it from its moorings, and the two craft drifted away.

The yacht's crew worked quickly, got clear, and hoisted sufficient sail for steerage way.

Meanwhile the hapless patrol craft had drifted clear and was engaged in breaking up somebody else's property.

Some while afterwards this patrol-boat, complete with a gaping hole in its bows, was towed ignominiously away from the scene of its misdemeanours.

By this time Lt. Cadringher had come round again in another wide turn, and was seen to be making a forced landing down towards Ryde.

The S.5 completed her sixth turn and then her seventh, thus disappearing from this history.

We saw Flg. Off. Atcherley take-off in the second S.6, and soon he appeared for his first turn, which he made rather widely. Shortly he was back to do his second, and then we saw Lt. Monti diving down on the starting line.

Our final excitement was the arrival of Lt. Monti and Mr. Atcherley at the point together, or very nearly so. The Supermarine came round fairly high and wide, while the scarlet-gleaming Macchi came round extremely low and in a very tight bend. As they raced past with the Italian in front we thought the Macchi appeared the faster.

Now the time had come for a change of anchorage, so the motor-boat slipped away to where a loud-speaker was audible. And from its stentorian throat we heard of Mr. Waghorn's amazing times and the forced descent of Lt. Monti.

ROUND WE GO!—Mr. Atcherley at the West Cowes turn.

We sat in the sun and watched Mr. Atcherley completing the course, and heard of his ever-increasing speeds. We heard with dismay of his subsequent disqualification, and then settled down to tea.

Later on the Junkers F.13 taxied nonchantly seawards, took off beyond the Roads, circled Cowes, and flew off. This machine appeared to be very manageable, and taxied through the shipping with no trouble whatever.

"ORFORD" IMPRESSIONS.

BY LEONARD BRIDGMAN.

At 07.30 hrs. on Friday, Sept. 6, one proceeded to Waterloo to take passage in the first special train to connect with the special Schneider "Cruise" organised by the Royal Aero Club and the Orient Steam Navigation Co. Ltd.

With the opulence of the Aircraft Industry and the growing number of wealthy people now taking an interest in aviation one expected a full train. Apparently the Southern Railway was of the same opinion,—but we were wrong. A nice long train composed of first-class corridor stock with two coaches fitted up with breakfast tables left Waterloo at 08.58 hours practically empty. Breakfast in an absolutely empty coach, which was thus running light on its springs, was of the sporting type, and the task of making connection between coffee cup and lips was only equalled by the difficulty of preventing the bacon and egg from leaping into one's lap.

After an otherwise uneventful journey one transferred to the tender at Southampton Docks to be conveyed to the S.S. *Orford* lying off Ryde. An Autogiro, whirling along at several thousand feet, passed over the tender just before it reached Calshot. At the latter place there were moored-out a Savoia S.55 twin-hulled flying-boat, two Southampton flying-boats, the two Supermarine Rolls-Royce S.6s, the Supermarine-Napier S.5 and two Macchi monoplanes. The last five, which were on their mooring-out tests, were carefully guarded by patrol boats. A hand-signalled warning from one of these boats resulted in the tender being slowed down while passing these craft.

On the slipway could be seen the tandem-engined Savoia racing monoplane and approaching the station, in the neighbourhood of Calshot Spit light, was the third Macchi monoplane being towed from the scene of the Navigability Tests to undergo its six hours' mooring test.

Digitized by Google

But enough of uninteresting detail and let us hasten to the *Orford*. She is a ship of 20,000 tons, has innumerable floors, or decks, interconnected with an elevator, two yellow funnels, which, owing to the fact that there are no low bridges between here and Australia, do not fold down, and a ventilating system in the dining saloon which could be guaranteed to transform a hot dish into a cold one in less time than it took to procure the services of a steward to re-direct the blast of cold air in another direction.

Once on board newcomers and those already there got jammed in the corridors trying to hurry to their cabins, unpack and be the first to appear on deck in whatever their idea of shipboard dress-wear happens to be.

One-way traffic and white lines would have been of considerable help, as would have been signposts and a few A.A. guides. The penetration of the rabbit warren-like interior of a ship is always confusing to land-lubbers, and the sporting of yachting caps provides very little help.

The remainder of Friday was given over to "shaking down" as they say on ships, although this phrase is intended to imply anything the reader may like.

The anchorages inside the course seemed particularly empty on the day previous to the contest. In the warship anchorage were three Italian ships, the cruisers *Pisa* and *Francisco Ferruccio*, and the square-rigged training ship *Cristofero Colombo*, the Chilean submarine *O'Brien* and a few British ships, including H.M.S. *Furious*, a light cruiser and a destroyer.

Among the liners in the vicinity of the *Orford* were the *Orontes*, a sister-ship of the *Orford*, the *Arandora Star*, of the Blue Star Line, and the *Araquaya*, of the Royal Mail Steam Packet Company. All these ships were on special two- or three-day cruises for the Schneider Trophy Contest.

Very little flying was done after the actual completion of the navigability tests. During Friday afternoon two Fly-catchers flew round the course, and later in the day the tandem-engined twin-hulled Savoia S-55 flying-boat also went round.

At about 20.00 hours a further tender-load of passengers arrived alongside and this completed the passenger complement of the ship with the exception of the load of day trippers or "emigrants" due to arrive on Saturday morning.

Saturday morning broke dull and cloudy with a fresh breeze, but even before breakfast the sky had cleared. All ships at their anchorages were dressed in accordance with the official request, but the Solent in the region of the *Orford* still seemed comparaitvely empty. H.M.S. *Argus* which had been lying off Portsmouth had now moved to her mooring near the western turning point, and H.M.S. *Centurion*, the wirelessly-controlled gunnery-training ship, had changed her wave-length and disappeared off the scene.

In the distance could be seen H.M.S. *Iron Duke* and H.M.S. *Ark Royal*, the former off Cowes and the latter nearer the Hampshire coast. An interesting but quite irrelevant point noticed with regard to the aircraft carriers *Argus* and *Furious*, both of which discharge their smoke aft below the flying deck, is that the after portions of the ships are painted black. This, one presumes, is a specimen of Naval economy to obviate the necessity of trying to keep the grey paint grey in an uneven battle with the ravages of soot and smoke.

As the morning wore on a considerable number of small boats took up their positions on the land side of the course off Ryde and through glasses large numbers of people and motor-cars could be seen massing along the Hampshire shore-line but the special stands appeared to be very sparsely populated.

A certain amount of fear and trepidation was felt as to the effect of bringing on a large number of day visitors to the points of vantage on the various decks of the *Orford*, but by the time the tender had disgorged its load of "emigrants" this fear was completely dispelled.

Incidentally, before the tender was alongside the order went forth that all cabins should be locked—an intimation of the opinion held by the Orient Line of the integrity of the Aero Club's visitors.

An early lunch enabled everyone to be on deck in plenty

THE LAND OF THE FREE.—Southsea Beach during the Contest.

Digitized by Google

of time to choose a suitable place from which to view the contest, but generally it was considered that a fixed location was undesirable. It was possible to see both the long legs of the course from the ship, and therefore most people chose to wander from side to side of the wide decks as the race progressed, with an occasional halt midway at one of the several loud-speakers to hear the broadcast from Ryde Pier giving the lap times and speeds.

Almost exactly at 14.00 hrs. the first starting gun was heard from Calshot and immediately afterwards a wisp of smoke was seen far away off Cowes. It gradually lengthened, and a tiny dot was seen at its head which grew with amazing rapidity into the Supermarine S.6 flown by Flg. Off. Waghorn. It shot across Ryde Pier and was gone away into the distance in less time than it takes to write this down. The race had started.

Excitement was intense. What would be the speed of he S.6 on its first lap? Would all the rumoured speeds be borne out in actual practice, and what would the new Macchi 67 monoplanes with their 1,700-1,800 h.p. Isotta-Fraschini engines do when their time came to start?

The S.6 could be heard coming along the Hampshire Coast and one endeavoured to pick it up. It was only after looking considerably ahead of where the sound appeared to come from that it could be seen speeding along low down under Gosport and past Lee-on-Solent.

By the time one had followed it as far as one could towards the Cowes turning point and crossed the deck to the Isle of Wight side it could be heard coming down the straight for Ryde on the completion of its first lap.

Very soon after his passing the speed was announced as 324 m.p.h.—43 m.p.h. faster than the winning speed of 1927 and 6 m.p.h. faster than the World's straightaway Speed Record.

The interest in the contest varied over a very large range. Some, in fact the majority, were engrossed in the race and kept their programmes fully up-to-date with the lap times and speeds as they were broadcast. But there were a few who slept through it and long before it was over there were others who could not resist the attractions of the Smoking Room and Lounge and the liquid refreshment dispensed therein.

The majority of people assembled on the top deck in the full glare of the sun. Here the view was obstructed by the boat-davits, and boat-falls, and, aft, by the netting of the tennis courts.

Below, on "B" deck there was more room, although by no stretch of imagination could the boat deck be said to be crowded. Here also there was shelter from the glaring sun which was right in the eyes of the spectators, there were no davits and there were two loud speakers which gave considerably clearer results than those above. On "C" deck there were not more than half-a-dozen people at the most crowded time.

The second machine away, a Macchi 52, flown by Signor dal Molin, looked perceptibly slower than the Supermarine S.6, but it also was the quietest machine in the contest, which perhaps heightened the illusion. This pilot, the only Italian to finish, flew low and put up a splendid demonstration of consistent piloting.

The third machine, the Supermarine S.5, flown by Flt. Lt. D'Arcy Greig, also flew a steady and an extraordinarily consistent course.

The fourth machine, the first of the new Macchi 67 monoplanes flown by Lieut. Cadringher, which only lasted one lap, was disappointing in its performance. It looked very fast and emitted a most ear-splitting roaring whine, but its lap speed of 284 m.p.h. was obviously not a true demonstration of its capabilities, a fact which was borne out when Lieut. Monti did one lap on a sister machine at 301 m.p.h. Lieut. Cadringher was troubled with fumes from the exhausts of the middle cylinder-block. These being on the left side not only fogged the left side of the windscreen in straight flight but also entered the cockpit when the machine turned.

As the Italian pilots were seated lower in the machines and had lower windscreens than the British, Lieut. Cadringher must have been very nearly blind when approaching the turning points, unless he flew wide. And on top of this he was being overcome by fumes and was flying the machine only for the second time, the first having been the navigability trials on the previous day. An exceedingly stout effort and one that deserved a better showing.

Flg. Off. Atcherley was the next away on the second Supermarine S.6, and his machine looked as fast as the first. Some people sensing that Mr. Atcherley, otherwise "Batchy," the "Tomboy," "Grock of the Air," etc. (*vide* the Daily Press), was going to fly all-out, declared that he was much faster than Mr. Waghorn. His first lap speed of 302 m.ph. therefore came as an astounding shock, but hope was

THE LAND OF THE FEE.—Ryde Pier and its Reserved Enclosure. The "Orford" in the background and Mr. Waghorn passing the finishing line.

Digitized by Google

revived when his subsequent lap speeds rose to the 330 m.p.h. order.

The last machine away was the second Macchi 67, flown by Lieut. Monti. This machine did look faster than that of Lieut. Cadringher and its sound was different. The noise of Lieut. Cadringher's machine was likened to "a hundred lunatic laundresses tearing up an acre of calico on board the 'Flying Scotsman' in the middle of a thunderstorm." So far as Lieut. Monti's machine was concerned one might perhaps leave out the thunderstorm.

After completing one lap at 301 m.p.h. Lieut. Monti was reported to have landed safely off Hayling Island with a burst oil-pipe, and this left the contest a certainty for Great Britain. Very satisfying, but at the same time disappointing, in that there was not more serious competition.

Thereafter people drifted about with a self-conscious smug look on their faces and said, "Jolly good show," in the same time-honoured fashion that Englishmen follow when labouring under the weight of victory.

[*Here the narrative will be discontinued for a few lines to represent the lapse of several hours given over to the inbibulation of the cup of victory.*]

For those not invited to the official banquet an early dinner was provided. At about 20.30 hrs. the dining saloon was cleared of unwelcome clients, and these social outcasts repaired to the after hatch, on which rested the Schneider Trophy, in readiness to witness the presentation ceremony, which it was announced would take place at 21.15 hrs.

The timetable was not strictly adhered to, but as a consolation for those waiting an excellent firework display at Ryde was witnessed under ideal conditions—that is, over water.

At 20.30 hrs. to a gun signal both the *Orford* and *Orontes* were illuminated in outline by electric bulbs and by floodlights and presented a pretty spectacle.

All three Italian war vessels were also illuminated, and the hull, masts and yardarms of the *Cristofero Colombo* were completely outlined.

While waiting for the arrival of the chosen guests an attempt was made to remove the unchosen ones from the vicinity of the presentation enclosure, but with no effect. At about 20.30 hrs. the banqueteers arrived in the enclosure, and Sir Philip Sassoon, Lord Thomson, Mr. Ramsay MacDonald, General Balbo and the British team assembled on the improvised platform. A short wait for the Italian team gave no result, so someone was sent in search for them.

Ultimately the Italian officers arrived, but great difficulty was experienced in getting the two modest Italian non-commissioned officers to mount the platform. Amusement was caused by the diminutive Serjt. Agello, who refused to take a chair while Sq. Ldr. Orlebar was standing. Sq. Ldr. Orlebar tried to equalise matters by sitting on one arm of the chair, but Serjt. Agello refused to sit down until signalled to by an Italian officer. Thereafter Sq. Ldr. Orlebar put his arm round Serjt. Agello's shoulders, as a true gesture of Anglo-Italian friendship.

The speeches, which were many and short, are dealt with elsewhere, so will be ignored here.

After the break-up of the presentation ceremony all adjourned to celebrate, and once again the curtain should be lowered to represent on this occasion not only a lapse of time but for some people a different kind of lapse.

The sight of famous aircraft designers wearing funny hats and playing silly instruments makes one believe that after all everyone is human, and that the chasing of X's can at times be varied by the hunting of grotesque reptiles of varied hues.

Music by the R.A.F. band provided an excuse for dancing up till 01.00 hrs., the bar was officially timed to close at 02.00 hrs., but there was no restriction as to the time people might go to bed, or to the amount of good cheer that might be dispensed in private cabins. All ended very cheerfully, but several heads throbbed on the following morning.

So far as the Schneider Trophy Contest was concerned, all was over. The *Orford* was once planned to cruise round the Isle of Wight on Sunday, but there was no doubt that the Orient Line desired to rid itself of its passengers as soon as possible. On Sunday morning at 11.30 hours, to much rattling of ship's bells, the *Orford* left its moorings and steamed down towards the Needles, with the intention, as everyone was led to believe, of cruising round the Isle of Wight.

On passing the Needles, however, the ship was turned completely round, and a course set for Hamble. The ship arrived there about 15.30 hrs.

On arrival at Southampton Docks a couple of hours later the railway sheds were locked, the train was in a siding and there were no porters available except for a few stevedores temporarily unemployed. After a wait of an hour the train

steamed out and eventually arrived at Waterloo at about 19.45 hrs.

One has had experience of ships ranging from those guaranteed to run 20 yards on one winding to Transatlantic liners, but the Orient Schneider Trophy two-day "Pleasure Cruise" was a new experience. Meals were not noted for their generosity of helpings, one felt that one's presence on the ship was by way of a favour on the part of the ship's officials, and when the race was over their one object was to get the passengers off as soon as possible. And all this for a sum which insofar as one was personally concerned would have transported oneself the best part of the way to Canada, with considerably more comfort and attention.

In voicing this complaint, let it be known that one is registering no grouse against the Royal Aero Club—in fact, one is grateful to that august body for providing one with the opportunity of sampling an Orient Line cruise.

It is true that the Orient Line does not habitually dock at Southampton, and therefore had to use what existing facilities there were that were not in use by other lines.

The fact that there were legitimate grounds for complaint is disclosed by the letter of apology, which has presumably been sent to all passengers in the *Orford* by the Orient Line.

[To which one may add that the "emigrants," who left Waterloo at 07.05 hrs. on Saturday found that no breakfast-cars were on the train, and no food was available at Southampton Docks,—so they starved till they were allowed to board the *Orford* at 11.40 hrs.—when a meagre buffet-lunch was provided at 3s. per head.—They left the *Orford* at 18.00 hrs. and arrived at Waterloo about 24.00 hrs.,—again without food on the journey.—And they had to pay £2 2s. per head for the day trip.—C. G. G.]

THE MARINE MIND AT WORK.

By C. G. G.

Once Aboard The "Orford."

Our naval manœuvres being over one returned by road from Calshot to Southampton and there waited for conveyance to the *Orford* in the tender timed to leave at 17.00 hours. At 17.30 hours the Southern Railway had still not delivered the special train of passengers for the *Orford*. Somewhere about 18.00 hours the train arrived and a very long time afterwards the Marine Mind began to work and the tender slowly started for Ryde.

The weather was charming and the voyage was enjoyable. But when we arrived at the *Orford* we found the Marine Mind at work again. After some hundreds of passengers had clambered into the ship by the solitary gangway their suitcases were slowly passed from hand to hand along the same gangway into the lobby at the end of the dining room where a number of people were already having dinner. The belated tender had arrived somewhere about the time when the second instalment of dinner ought to have been served.

Half an hour or so later the baggage had been sorted out to the various owners and by about 20.30 hours there was a chance of looking for some dinner. Then one found that the Marine idea of staff-work had been operating. People who had arrived on the tender after the first sitting at dinner had begun found that they had been allotted seats for the first sitting at 19.00 hours.—And who wants to dine at 19.00 hours anyway, except at sea when one is ready to eat at any time?

Ultimately we managed to get a dinner which might have been value for eighteenpence in Soho, but must have seemed very poor value to some of our foreign visitors who were paying about £10 a day for their accommodation. One likes chip potatoes, but one does not like chip partridge. Nor does one like an alleged Pêche Melba made with tinned peaches and cornflower ice, flavoured apparently with aniline dye. And the Wine List of the *Orford* was a curiosity, because of its amazing omissions,—not being much of a wine drinker oneself it did not matter vitally.

The *Orford* herself is a fine modern ship. The cabins are of the Bibby type which arranges quite cleverly that even the innermost cabins shall each have a port hole. Mr. Bibby began by making oil-cake for cattle. Then apparently he bought cattle to eat his oil-cake. Then he started canning his cattle. Then he bought ships to transport his canned and chilled meat. And then he found that passenger traffic might be made to pay, so apparently he invented cool cabins for passengers as well as cold rooms for chilled meat. The result is quite the best cabin system in the World.

But the Marine Mind has not yet discovered how to give passengers hot water in their cabins by the simple process of fitting each with a Junkers electric geyser,—which is found in thousands of middle-class houses in Germany, and could be fitted in every cabin at a cost of three or four pounds.

Personnel.

The personnel in the *Orford* was curiously uneven. One had the best cabin steward one has met and one was awakened unnecessarily early by bath-room stewards whistling in the corridor outside, a thing that simply could not happen in some ships. One of the table-waiters was the best possible and another who was so sulky that one nearly hit him.

On the Saturday morning we all had as good a breakfast as could possibly be served. On Sunday morning, getting up a trifle late after the party, we found that at 10.30 hours there was absolutely nothing to be had except some

SUPER-MARINE.—The pleasure party arranged by the Design Department of the Supermarine Works, paying a triumphal visit to the "Orford," after their victory.

Digitized by Google

obsolescent cold ham, indifferent eggs and soggy toast. We were not among the most luxurious passengers, but even at such an absurdly low price as four guineas a day one does expect decent attention, and one does suggest to the Orient Line that 10.30 a.m. is not too late for breakfast on a Sunday morning.

The truth of the matter seems to be that the chief catering official in the *Orford* is so used to having a kind of grown-up school treat of World-tourists who humbly obey his orders as to when they may eat and when they may not that he thought he had the same kind of clientèle last week-end. He ought to go and do a few weeks' service in the Cunard on the Atlantic run for his education. In the *Mauretania* one never found the slightest trouble in getting anything one wanted at any time of the day.

On Tuesday morning last the passengers in the *Orford* received an apology from the Orient Line for the delay in getting them away from Southampton Dock. One can assure the Orient Line that the delay for which they apologised was of little account compared with other things for which they did not apologise.

Somehow the whole arrangement reminded one strongly of those great Irish houses in which the architecture, decorations, and general equipment, are equal to the finest things of their kind in the World and all the outer accessories and a good many of the internal arrangements would be laughable if they were not tragic. Some years ago Rudyard Kipling wrote what he thought about the P. & O. Line, in describing his journey to Egypt. He might confer a benefit on the Orient people by doing much the same to them. But one doubts whether even the power of Kipling can have any serious influence on the Marine Mind.

THE CONTEST.

The actual Contest for the Schneider Trophy as seen from the *Orford* was extraordinarily dull. The human eye and mind very easily becomes accustomed to the sight of a machine streaking along at about 300 miles an hour, and after the thrill of the first roar of the Supermarine S.6, and the thought that this great international contest had really begun, there was really little to be said about it.

At first people did rush from one side of the ship to the other as the machines passed on their Eastward and Westward journeys. But they soon lost even that much interest. There was one passenger who grumbled terribly because the competition began at 14.00 hours. He said that he always had lunch at half-past one and that after lunch he always had a little nap and waked at three. And he could not understand why the race began so early. He was assured that the start could not be postponed to oblige him, so he had his lunch at half-past one and he slept peacefully till long after three in the saloon.

All the news of the Contest was very well delivered by the loud speakers, and there was practically no excitement at all.

Mr. Atcherley's disqualification naturally caused a great deal of disappointment. Seen from the *Orford*, he seemed to pass properly to the right of the mark-boat at Bembridge and then swerve further to the right, and then turn left beyond it.

Apparently what he did was to pass almost over the mark boat, but ever so little to the left of it—and so got himself disqualified. Apparently he realised that he was on the wrong line and turned out to the right,—hoping that he was still in time to clear it. But by that time he was too late.

The result was that owing to his swerve to the right he actually covered a much longer course than he would have done if he had been on his true course. And yet, of course, he had to be disqualified for it. The cause of his trouble was the loss of his goggles, as described by Mrs. McAlery.

The only other incident of any kind was the passing of the first Macchi 67. It left a trail of thick smoke behind it, and on reaching the turning-point at Bembridge did the typical Italian turn, which is done by throwing the machine up into the air, cart-wheeling it onto the left wing and then diving it onto the course again. A very wasteful but highly spectacular method. This, as done with the trail of smoke, caused somebody to ask whether this was a race or a demonstration of sky-writing.

Everybody admired the extraordinary regularity of Flt. Lt. Greig's lap times. A comparison of the score board at Ryde, with that at Venice two years ago, which THE AEROPLANE is able to publish thanks to a loan of the photograph from Flt. Lt. Webster (who happened to have it in his pocket on the *Orford*) shows that Flt. Lt. Greig was very nearly as regular as Flt. Lt. Webster.

The interesting point about this machine is that the machine which Flt. Lt. Greig was flying was actually that which Flt. Lt. Worsley flew at Venice in 1927, but it had had

LE GRAND PENSEUR—OF TO-DAY.—Sir William Morris, of Morris Motors Ltd., on the "Orford."—The man who may give us the 100 h.p., 100 lb., £100 aero-engine.

put into it, instead of its ungeared Lion, one of the geared Lions which was built as a spare for the Contest at Venice.

We were all very sorry when the Italian machines came down, but after all General Balbo had said on the subject we were not surprised. The ear-splitting scream of the Macchis was rather impressive. Whether it comes from their three-bladed airscrews or from their superchargers nobody seemed to know. But it would have drowned even a Fairey Fox.

The extraordinary accuracy with which the capacity of our machines had been gauged was shown when Mr. Waghorn came down on his eighth lap, having run completely out of petrol. As described elsewhere, he was under the impression that he had only done six laps when he had in fact done seven, and he ran out of petrol when well within sight of Ryde in the eighth lap. Which means that for a seven-lap race the machines were only carrying enough petrol for seven laps and three-quarters.

One slight satisfaction that we had in the *Orford* was learning that there was any quantity of room on Ryde Pier, and that apartments could be had in the Isle of Wight at the last moment at very low prices,—so much for the Island pirates, whether Jutes or Jews.

Apparently the Southern Railway had very much underestimated the gullibility of the public in trying to get them to pay three guineas for a trip from London to Ryde and back with a seat on the Pier. If they had been content to charge 25s. or 30s. they might have filled the place.

And undoubtedly Ryde Pier was the best point from which to see the Contest, for on the Hampshire coast, as on the ships, the onlookers had the sun in their eyes, whereas on Ryde Pier the light was exactly right and the machines passed very much closer.

And that is about all there is to be said on the subject. For the benefit of those who really want a description of the Contest one appends a few extracts from *The Sunday Express*, written by a Mr. Denis Dunn. Frankly, THE AEROPLANE cannot compete in descriptive writing. And the Staff collectively takes off its hats to what Mr. Denis Dunn.

The boom of the starting gun—a roar—a glittering, flashing bullet hurtling through space—a flash—and gone!

That is the story of how Britain retained the Schneider Trophy yesterday, when two million people saw three British and three Italian airplane pilots laugh at death in

Digitized by Google

an attempt to cover seven 31-mile laps over the Solent in the quickest time.

It was a great day for Britain.

That air epic of to-day will never be adequately described. While these dare-devils of the air crashed past us I heard women scream hysterically, saw them faint—and saw men turn their heads away.

Waghorn made two million hearts palpitate as they have never done before. His turns were splendidly reckless. Men who had travelled thousands of miles in the air stood there breathless.

"That strain will tear the wings from the fuselage," yelled an excited official. Once he missed a flight of seagulls by a few inches Once he turned so sharply that his exhaust smoke cut an acute angle in the sky.

What was the race for the two million people who watched?

This:—

A battery had opened fire in the sky! They are coming! The dainty deadliness of them.

Something silver hurtles by, and loud speakers and half the world shriek: "Waghorn, Supermarine. Waghorn, Supermarine."

The silver something became a dancing dot on the horizon, while the unbelievable noise of the engines battered at our ear-drums, and we realised that there was an heroic lunatic in the dancing dot.

"Viva Dal Molin." Every Italian opened his lungs as the stout old Macchi—blood-red and fearful—catapulted past, to become another of those devilish dots.

"He is our deadliest rival," said an R.A.F. officer, levelling his glasses. "That old Macchi, with her new engine, can beat anything we can do, for, don't forget, Waghorn's S.6, the Rolls-Royce, is a 'paper' engine, and we really know very little about it."

"Aye ——" his words were drowned by a loud speaker.

"D'Arcy Greig," it bellowed. Although crammed in his little cockpit, Greig would have smiled to hear the cheers that met him as he flashed over the line. So they passed. It is a dread anthem to speed, a sacrifice to "idol m.p.h."

"Cadringher," shrieked the speaker. Again a scream in a cloud banged by. That yelling flash of spotted lightning was built in nineteen days, and the gambler in the cockpit was testing it fully for the first time.

"Atcherley," cried the speaker. "Atcherley is playing pitch and toss with his life."

"Monti," howled the wireless. "Zoom"—he passed while our hands had only begun to wave. "This speed is Satanic," whispered a white-faced official. He clutched my coat and screwed up the clothes in his hand, curious little tremors ran through the spectators' faces as the terrific roar of the engine caught them square in the ear-drum.

They were white and afraid, but loving it like people on a scenic railway on the brink of a dive.

A gun fired. It was over.

An hysterical woman screamed—shrilly screamed—at steady intervals, but the others drowned her. Cheers crackled round the coast. Hats flew up like gargantuan confetti; women giggled—some cried. It echoed over from Portsmouth, and we in Ryde sent it back across the Solent.

Minutes of terrific cheering, and then the mosaic of white sails broke up on the Solent, and curious seagulls ducked

[But not in THE AEROPLANE.—C. G. G.]

THE CLOSING SCENES.

CEREMONIAL.

The closing ceremony of the whole affair was a banquet given in the steamship *Orford* by the Royal Aero Club to the competing teams and a number of assorted distinguished visitors, besides several undistinguished. Considering that this banquet was an overload on the supply staff of the *Orford*, it was surprisingly well done.

Here one may remark that the reason why those who went to the banquet were asked officially not to dress was that the official guests included a number of distinguished diplomatic and Service representatives of Foreign nations who had been asked by the Government Hospitality Branch to see the race from H.M. Aircraft Carrier *Argus*. These guests having come down from Town for the day, naturally could not be expected to bring evening dress with them. So the people who were living in the *Orford* also retained their day clothes, so as not to put them out of countenance. The thought was a kindly one of the Committee of the Aero Club. But they might have stated their reasons when sending out their notices.

The whole arrangement produced the curious effect that while the ordinary members of the Aero Club and the various hangers-on of Aviation who only take an interest in the game on great occasions were doing themselves well in the first-class saloon in evening dress, the Great Ones of the Aeronautical World were feeding in the third-class saloon in any old clothes they happened to be wearing during the day—for the third-class saloon was the only apartment on the ship big enough to hold the assembled notabilities.

THOSE PRESENT.

The guests of honour at the Banquet, besides the competing teams, were:—Marshal of the Royal Air Force Sir Hugh Trenchard and Lady Trenchard, Air Chief Marshal Sir John Salmond and the Hon. Lady Salmond, Admiral Sir Roger Keyes, the Rt. Hon. Sir Samuel Hoare and the Lady Maud Hoare, Brig.-Gen. the Rt. Hon. the Lord Thomson (Secretary of State for Air), His Excellency General Italo Balbo, Herr Brandenburg (German Controller of Aviation), M. L. Hirschauer (The Aéro-Club de France), the Rt. Hon. J. Ramsay MacDonald and Miss MacDonald, and Mr. F. Montague (Under-Secretary of State for Air).

Among those also present were:—

Sir Alan Anderson, Major K. M. Beaumont, Lt.-Col. de Bernardi (winner in 1926), Mr. H. C. Biard (winner in 1922), Group Capt. A. W. Bigsworth, Lt.-Col. B. F. Bitossi, M. L. Blériot, Group Capt. R. J. Bone, Air Cmdre. F. W. Bowhill, Sq. Ldr. A. R. Boyle, Lt.-Col. J. T. C. Moore-Brabazon, Air Vice-Marshal Sir Sefton Brancker, Group Capt. Breese, Mr. Griffith Brewer, Lt.-Col. W. A. Bristow, Sir Harry Brittain, Mr. H. S. Broad, Major J. S. Buchanan, Mr. C. Ll. Bullock, Mr. N. Burroughes, Mr. J. C. Cantrill, Air Cmdre. J. A. Chamier, Capt. L. W. Charley, Mr. C. L. Colebrook, Lt.-Col. M. O. Darby, Mr. F. G. T. Dawson, Capt. G. de Havilland, Rear Admiral L. Donaldson, Mr. C. R. Fairey, Lt.-Col. L. F. R. Fell, Group Capt. A. Fletcher, Mr. H. P. Folland, Mr. Lester D. Gardner, Mr. Alan Goodfellow, Lord Gorell, Lt.-Gen. A. Grocco, Sq. Ldr. R. A. de H. Haig, Jonkheer Van den Berch Van Heemstede, Sq. Ldr. W. Helmore, Air Marshal Sir John Higgins, Air Cmdre. T. C. R. Higgins, M. L. Hirschauer, Capt. von Hoeppner, Air Cmdre. F. V. Holt, Wing Cdr. B. L. Huskisson, Mr. J. J. Ide, Mr. F. H. Jones, Air Vice-Marshal C. L. Lambe, Capt. A. G. Lamplugh, Col. F. Lindsay Lloyd, Air Vice-Marshal C. A. H. Longcroft, Mr. David Longden, Mr. John Lord, Mr. H. W. W. McAnally, Lt.-Col. Sir Francis McClean, Mr. I. H. McClure, Sir Robert McClean, Sq. Ldr. R. L. G. Marix, Maj. R. H. Mayo, Mr. R. J. Mitchell, Mr. R. H. S. Mealing, Group Capt. E. R. C. Nanson, Lt.-Col. Mervyn O'Gorman, Mr. F. Handley Page, Mr. Hubert Scott Paine, Major R. E. Penny, Mr. C. Howard Pixton (winner in 1914), Flt. Lt. R. L. Ragg, Mr. F. E. N. St. Barbe, Lieut. de Vaisseau A. Sala, Air Cmdre. C. R. Samson, Sir Henry Segrave, Col. the Master of Sempill, Mr. A. F. Sidgreaves, Wing Cdr. S. W. Smith, Mr. T. O. M. Sopwith, Mr. T. S. Sprigg, Maj. O. Stewart, Mr. O. J. Tapper, Lieut.-Cdr. W. D. Thomas, Mr. H. T. Vane, Wing Cdr. W. Welsh, Capt. G. S. Wilkinson, Capt. C. B. Wilson, Flt. Lt. Webster (winner 1927), Mr. H. E. Wimperis.

After all had well eaten and drunken, Sir Philip Sassoon as Chairman of the Royal Aero Club announced that the Schneider Trophy would be handed over to the British Team on the after deck.

Sir Sefton Brancker then arose and said: "Will you all please keep your seats till those at the tables to my right and left" (meaning the high and distinguished official guests) "can get up." Fortunately they were all able to do so, in spite of the excellence of the wines, and within a few minutes not only the plain-clothes banqueting party but the much more respectable-seeming people from the upper decks and the first-class saloon were assembled round the after well-deck—which one believes is the proper nautical phrase—where was a platform backed by flags of all nations with the Schneider Trophy in the middle, and chairs round about for the teams and the Highest of all Officials. The platform and the Trophy were flood-lighted, and the whole effect was rather pleasing.

SIR PHILIP SASSOON, opening the proceedings, sympathised with the Italians in the hard luck which had befallen them, and congratulated them on their splendid sportsmanship in coming to England to compete. He expressed particular sympathy with the Italian Nation in the death of Captain Motta. He then congratulated the British team on their team work and on their individual skill, and also those who were responsible for the design and construction of these remarkable engines of steel and fabric.

He said that Squadron Leader Orlebar, the Team Captain, Flying Officer Waghorn the actual winner, and the aircraftmen who had handled the machines and worked hard, equally with the skilled engineers and mechanics of the constructing firms, all deserved the best thanks of the British Nation for justifying the confidence placed in them and securing this victory over worthy opponents.

THE PLATFORM PARTY.—From left to right: Sergt. Agello, Mr. Ramsay MacDonald, Sq. Ldr. Orlebar, Lord Thomson, Flg. Off. Waghorn, the Italian interpreter, Sir Philip Sassoon, Col. Mervyn O'Gorman, Warrant Officer dal Molin, Flt. Lt. Greig, Lieut. Cadringher, Fig. Off. Atcherley, General Balbo, and Lieut.-Col. Bernasconi.

WAKEFIELD Castrol Regd. MOTOR OIL

—The Product of an All-British Firm

C. C. WAKEFIELD & CO. LTD., Wakefield House, Cheapside, London, E.C.2.

Digitized by Google

He reminded his hearers that till that day an Italian engine and aeroplane held the World's Record for speed, and he said he was not certain that the machines now in the workshops of Italy might not soon give us another achievement to surpass.

He said that the justification for risking lives in these competitions, and in the outlay of money involved, lay not only in the scientific and technical progress which was produced in building these crafts, but in the friendly chivalry which was caused and the lasting friendships which were produced between the competing nations.

Sir Philip ended by saying that this year's victory was a remarkably achievement, and if, in future, Italy should win the Trophy, she would receive no greater applause than that from the British Empire.

GENERAL ITALO BALBO, speaking through a remarkably clever interpreter, said how grateful he was to his dear friend Sassoon for his kindly words about Captain Motta. Nobody more than aviators themselves could appreciate the words pronounced. He thanked the British aviators for their kind sympathy and assured us that none felt more deeply the loss of our wonderful Kinkead than did the Italian aviators.

Referring to the event of the day, he said that Italy had obtained the results which they expected and they had now finished playing their part as sportsmen. To-morrow their work as competitors would begin.

But before beginning, he would like to congratulate the winners. The English had won a great prize, and the world looked on the winning pilot as a master. He hoped that we should meet again—with other nations also competing to make the winning more difficult. He extended his hearty congratulations to the winner.

LORD THOMSON, as Secretary of State for Air, read a telegram from His Majesty the King, conveying hearty congratulations to Flying-Officer Waghorn and the Royal Air Force. Lord Thomson congratulated the Italian pilots on their high courage and skill.

SIR PHILIP SASSOON, calling on the winner for a few words, said that we must suppose that Flying Officer Waghorn had won the Trophy, though he looked so composed and clean that he hardly seemed to have come out of the cock-pit of an aeroplane.

FLYING OFFICER WAGHORN said that really he had nothing much to say, he had had no difficulties during the contest, and everything had been plain sailing. He expressed his gratitude to the Italian team for competing, and to the meteorological experts for assuring fine weather.

LIEUT.-COL. MERVYN O'GORMAN, thanking Sir Philip Sassoon for his part as Chairman of the Royal Aero Club, said that by acquiring him as Chairman the Aero Club had received a very charming fillip.

THE PRIME MINISTER, MR. RAMSAY MACDONALD, rising in response to loud demands for a speech, said that he was there as a guest and that such demands were most improper. He said that in such a contest as this we were always sure to see a splendid demonstration of true sportsmanship. The victor held his friendly competitors in profound respect.

He then pledged the British nation to a continuation of the contest by assuring Italy that "*we are going to do our level best to win again.*"

He said how profoundly thankful he was that no accident had happened.

He added that now he considered himself an aviator, and had been wondering whether Flying Officer Waghorn would not give him enough instruction to enable him to get his certificate. Becoming serious again, he congratulated Mr. Waghorn on his fine courage, and wished the best of luck to our Italian friends in their future efforts.

SQUADRON LEADER ORLEBAR, also rising under protest in answer to appeals, thanked everybody for the kind things said about the team. He referred especially to Flying Officer Moon, the engineer in charge (Voice from the background: "Shine up, Moon!"), and those members of the team who were not on the platform. He mentioned particularly the Non-Commissioned Officers and Airmen who had kept them going. He also said how much he appreciated the sporting action of the Italian team in coming over.

LIEUT.-COL. BERNASCONI, the Captain of the Italian team, offered thanks for the courtesy which his people had received from the British team, and the help that had been given to them. They had come to England to show their goodwill; some day they hoped to do better. He congratulated the English team on their victory.

ANTI-CLIMAX.

So ended one of the greatest events in the history of International Aviation. Everything thereafter was more or less an anti-climax. But some of it was very funny. The Government guests and the teams were taken off the *Orford* by tenders into the darkness, and, one hopes, arrived safely at their intended destinations in Town, in yacht, or what not. And those who remained on board celebrated the event with solemn dance, in more or less approved fashion. The R.A.F. band played the dance music quite as if it enjoyed it, and seemed to forget that it generally plays military marches. But one cannot understand why it thinks that it can play dance-music under normal conditions.

After the ball was over, the celebrations continued till an early hour.

Some of us who stayed up late will hold in memory a kind of mental photograph of a distinguished Squadron Leader endeavouring to balance half a dozen soda-water

THE TIMES OF 1927.—The score-board on the Lido. There is interest in comparing the regularity of Flt. Lt. Webster's times with those of Flt. Lt. Greig in an exactly similar Supermarine-Napier S.5.

THE LAP TIMES.—The official score-board on Ryde Pier.

bottles one on top of the other till they wobbled like a snake trying to stand on end, while another distinguished Squadron Leader, who has served much in the East, paraded round him, with bows and waving of arms, chanting Oriental incantations fitting to a snake-charmer. And there is a story of one gentleman who passed out completely and woke in the dim dawn to find himself laid out, with flowers along his sides and a bunch of lilies in his crossed hands, and wondering whether he was dead or alive.

Next morning, by way of clearing the cobwebs, we were taken for a charming trip up past the Needles and back. We were all quite happy, because we thought we were going straight up to Southampton. But we anchored just off Calshot.

Then a kind of a cross between a tender and a tug came alongside and the passengers were herded into it. There was standing-room only for most of us, though some people found lying accommodation on the covers of some boats. There we sat, or stood, or lay, grilling in the heat for an hour and a half, while the baggage was slowly handed from the ship to the tender. The Marine Mind has not apparently risen as yet to the idea of a luggage-chute on the lines of a moving staircase, even though farmers, who are supposed to be the most stupid of land-living humanity, have been using elevators on a similar principle for hay and straw for about fifty years.

After that we took something over half an hour to get up to Southampton Dock, where the Marine Mind again became manifest. Only one gangway was put up to the tender and down it the passengers passed in about 20 minutes. Then three or four stevedores proceeded in a leisurely way to put the luggage ashore. Most of the shifting was done by the passengers themselves, who squeezed past the stevedores up the gangway and helped themselves out of the heap of baggage on the deck.

All this took about another half an hour. And, be it remembered, the baggage was nearly all suitcases. So what would happen with a load of passengers accompanied by heavy baggage for a long sea voyage, heaven alone knows.

Having thus acquired our light luggage, some of us got away to taxis and cars, thinking that we had then done with the sea-faring people. But before we could get out of the Docks we had to cross the Railway, and we found the road blocked for a further five or ten minutes by the Southern Railway's special train for the *Orford* passengers, which could not get down to the Dock to pick them up because nobody had thought of opening the shutters which give access from the quay to the railway platform.

Southampton Docks belong to the Southern Railway, but they are run in such close conjunction with the shipping people that apparently they also have acquired the Marine Mind. And the Marine Mind, as so often demonstrated, has absolutely no appreciation of the meaning of Time. It may set its ships on fire, or burst its boilers, or run them onto rocks trying to beat some place-to-place record for the sake of publicity, but, apart from that, Time has positively no meaning. And so long as it brings its passengers to their destination it seems to think that it has done everything that can be expected of it. And that is why air-transport is some day going to kill sea-transport.

Anyhow, at last the train moved out of the way and we were able to get out of the Dock gates onto normal roads and back into normal living. For which relief much thanks.

—C. G. G.

THE SCHNEIDER TROPHY BY WIRELESS.

By L. W. Norton.

1.50 p.m. on Saturday last was probably a time that was looked forward to by thousands of people who, like myself, were unable to see the actual Schneider Trophy Contest itself, but were relying on the much abused B.B.C. for their share in the thrill which the other thousands were to get round about the Solent.

Lunch was hastily swallowed and fingers were itching to leave knives and forks for those little black knobs that wireless fans love to twiddle till the small hours of the morning. But with 1.50 p.m. arrived the tragedy! A high-tension battery whose condition resembled the railway bun, in that it had very little *current*, was doing its utmost to ruin reception.

Not to be outdone, the trusty Austin 7 standing at the doorway was started up, and taken off with a speed that would probably have frightened early Trophy holders, and a race followed through traffic to a friend's house, known to possess the very latest thing in sets.

Apparently nothing had been missed, as Mr. Waghorn was still in the air causing awful vibrations to the various screened-grids and valves each time he hurtled past the microphone.

Our hearts thumped as we caught the excitement of the two announcers and their cry of alarm as one Italian gentleman dived low down as if to give us a "close up" of his engine—the reading of countless official chits, all with higher speeds for our machines, punctuated with terrific bursts of noise from another competitor crossing the line—was most realistic.

One feared for the safety of these men as one heard that two had force-landed, and for once in a way one appreciated the efforts of those at the other end of the land-line, and hoped that they would be preserved from the fate which one confesses one has often wished would overtake so called professors after their particularly dry talks.

Next came Mr. Atcherley's wonderful flight to keep our interest up, and the note of his powerful engine brought a look of dismay to the owner of the aforementioned super-set, who informed us that he had paid 12s. 6d. for those valves and made to switch off at the critical period when we were waiting for the speed of Mr. Atcherley's last lap. Much to our relief we heard that the noise was the shattering of the lap record, and that our friend's valves still dull-emitted!

Thus were we able to follow the progress of the race through the able descriptions of Sq. Ldr. W. Helmore and Flt. Lt. R. L. Ragg, and one takes this opportunity of thanking these two gentlemen for talking to us at a time when they probably would rather have sat and stared in amazement at those record breaking aviators.

THE PUBLICITY VIEW.

By Geoffrey Dorman.

The following firms supplied various necessities to the Supermarine S.6 monoplane and Rolls-Royce "R" engine and thus ensured the victory:—

The airscrew was a Fairey-Reed and this, as Mr. Fairey points out, should get the most credit because, being in the very forefront of the machine, it came in first before any of the rest.

SAFETY. – **Actual photograph taken from an accompanying plane of six members of the Royal Air Force jumping simultaneously with IRVIN Air Chutes from Vickers Virginia bombers.**

Jump—

----Zip!

IT'S OPEN.—You're safe! Your fall stops You rest in mid air. And then relax.

You glide smoothly, easily groundward, sharing the long-proven confidence of certain safety that Irvin Air Chutes have bred all over the world, in the minds of men who fly—and sometimes jump.

Scores and scores know what a life saver this is, from their own wide experiences in the air.

Already more than 200 aviators have been saved by use of their Irvin Air Chutes when naught else could possibly have brought them safely down.

Among these are aviators in the Air Forces of Great Britain, Japan, Sweden, Denmark, Poland and the Argentine Republic, as well as scores in the United States.

A number indeed have been saved in commercial operations.

Many of the emergencies were of the most extreme nature, and in every case the Irvin Air Chute functioned perfectly.

After thorough investigation and rigid comparative tests, many Governments have adopted the Irvin Air Chute as the standard life-saving equipment for their Air Forces.

If extreme emergency—all unannounced as it usually comes—suddenly confronts you in the air, will you, too, be ready to meet it with Irvin confidence?

SEAWORTHINESS TEST OF "ROHRBACH-ROMAR."

SEAWORTHINESS !

Seaworthiness will always be one of the most difficult conditions to be met by flying-boat constructors.

For quite a couple of years the Aircraft Industry has been unable to guarantee their Customers any reasonable figures of seaworthiness for flying-boats.

The Rohrbach Metall-Flugzeugbau G.m.b.H. was the first firm, ever since the construction of flying-boats was started by the industry all over the world, to guarantee, for the three "Rohrbach-Romar" ships then under construction seaworthiness in a sea up to force 5 (Beaufort).

On December 12th and 13th, 1928, the "Rohrbach-Romar" underwent her seaworthiness trials, under supervision and to the entire satisfaction of the "Deutsche Versuchsanstalt für Luftfahrt and Deutsche Lufthansa A.G.," who satisfied themselves of the excellent manœuvrability of the ship in rough waves.

CUTTY-SARK — CABIN FLYING BOAT

Twenty years' experience

in the design and production of aircraft, in addition to a century's work in marine construction, is the foundation upon which rests the new and modern organisation of Saunders-Roe.

Since the pioneering days of flying there have been Saunders seaplanes; and the name of Roe, associated as it is with the design of Britain's earliest aeroplanes, becomes, as it were, the final symbol to complete the hall-mark of proficiency in aeronautical research and design.

The flying-boats, seaplanes, and amphibians produced by the house of Saunders-Roe are backed by a combination of experiences, ideas, and achievements, together unique and outstanding in the sphere of aeronautical engineering. This vast constructional and servicing organisation is ready and well able to meet the world's demands for airworthy and seaworthy British marine aircraft.

The fuel used was an Ethyl mixture of Pratts' supplied by the Anglo-American Oil Company.

The instruments, of course, were supplied by Smiths Aeronautical Instruments, which is the new branch of S. Smith and Sons (M.A.) Ltd., which has been formed as a separate entity under the guidance of Mr. J. E. Chorlton to supply the aeronautical community.

Lodge Plugs were used. This is the first time since the War that this famous firm has made a serious attempt to be represented in an air race, and one congratulates them on their instant success.

So far as one can gather no one appears to have made the carburetter. It was a miracle and just happened. Anyhow it never popped a pop.

The magnetos were made by the famous firm of British Thomson Houston Co. Ltd., which have made nearly all the magnetos for successful British aircraft since the War.

The dope was supplied by Cellon Ltd., who thus continue to keep unbroken their record of having doped all British Schneider winners. They doped many of the passengers on the *Orford* as well.

The general mess-up on leaving the *Orford* was made by the Orient Line and the Southern Railway between them and the subsequent remarks made by the unfortunate passengers are unprintable.

The broadcasting of the race was made by Sq. Ldr. Helmore who occasionally allowed Flt. Lt. Ragg to say a word (but very occasionally).

The course was made by the Schneider Trophy Committee, but having seen them in action one realises that they probably could not help it.

The mistake of anchoring the *Orford* so far off the course that the machines could only be seen in the distance was made by the Orient Line with the cordial co-operation of the Admiralty and the King's Harbour Master. [Plus the Marine Mind.—ED.]

The wet paint on the mast on which Mr. Joe Taylor of B.P. sat to hear the speeches was probably made by Mr.

Dick Ashley Hall and John Hall and Son (Bristol and London) Ltd. He *would* do that sort of thing. Anyway he left his dog at home.

The refreshments supplied at Capt. Charles Wilson's party on Saturday night were made by Messrs. Bollinger, Bass, Haig and other great patriots. No one was sufficiently interested the next morning to care who would supply the coffins.

All that beautiful crockery from the *Orford* which throughout the three days found its way to the bed of the Solent, and will make bathing at Ryde so perilous in the next few years, looked as though it was supplied by somewhere in Bond Street.

The pen with which this has been written was supplied by the office and has now come to an end.—G. D.

THE FLYING SQUAD COMPETES.

Eight foreigners, believed to be members of an international gang were arrested among the crowds of spectators at Portsmouth on Sept. 7 and on Sept. 9 were sentenced to three months' imprisonment each as suspected persons, and recommended for deportation. Two were Belgians, one a Spaniard, and five Italians.

In London two Italians were arrested on a charge of loitering for the supposed purpose of picking pockets on the night of Sept. 7 outside the London Hippodrome.

They were remanded on Sept. 9 at the Bow Street police court pending inquiries Both had come from Italy to see the Schneider Trophy Contest and had arrived back at Waterloo a quarter of an hour before they were arrested.

THE WEEK'S BEAUTIFUL THOUGHT.

The following letter from a woman reader has been sent to *The Daily Express*:—

Sir,—I wonder how many women wish, like myself, that some of the brains and energy that are brought to bear on perfecting speed machines and other horrors of modern progress might be diverted to solving the problem of, say, the extinction of the common house-fly?

(Mrs.) P. E. COPE.

A PORTSMOUTH BANQUET.

On Sept. 9 the Lord Mayor of Portsmouth, Councillor J. E. Smith, entertained at a civic banquet at the Portsmouth Guildhall the officers and men of the Italian Naval Squadron and the British and Italian pilots in the Schneider Trophy Contest.

The Lord Mayor presided, and among his guests were the Italian Ambassador, Admiral Rota, commanding the Italian Squadron, Colonel Bernasconi, Admiral Sir Roger Keyes, Commander-in-Chief, Portsmouth, Rear Admiral L. A. B. Donaldson, Rear Admiral Dunbar-Nasmyth, V.C., Air Commodore T. C. R. Higgins, etc. The Lady Mayoress entertained a large party of ladies who afterwards gathered in the balconies to listen to the speeches.

THE LORD MAYOR proposing the toast of "The Royal Italian Navy" welcomed Admiral Rota and the other representatives of the Italian Squadron and also the Italian and British aviators who flew in the Schneider Trophy Contest. He said that he was especially glad to welcome two of the Italian pilots who had competed in the Contest. The spirit of sportsmanship they had shown in circumstances of great difficulty had won for them the admiration of all. While naturally thrilled by the triumph of the British team we were stirred by the Italians' heroic fight against immense odds and sympathised with their bad luck.

THE ITALIAN AMBASSADOR, responding, expressed his admiration of the splendid performance of the British team and renewed his congratulations to the R.A.F., Flg. Off. Waghorn and his colleagues, to the Supermarine Company and to the Rolls-Royce Company. He said that the Italian team came over prepared to be beaten after a succession of misfortunes, but added that he personally insisted that they should come. In this he had an easy task as he felt, as everybody in Italy felt, that it would be a test of friendship and sportsmanship to give to the contest the chance of a competition. In such a contest it is not only the victory that counted. It is also a glory to have been able to try to reach this victory. As the British Prime Minister said at the presentation ceremony on the previous Saturday, he reiterated that Italy will do its best, as Great Britain will do, to win the next contest.

ADMIRAL ROTA, replying for his squadron, thanked the Lord Mayor for the splendid hospitality which had been shown them by the City of Portsmouth. Referring to the Schneider Trophy Contest, the Admiral said that what struck him most was the liking of the British people for a struggle of any kind. The Italians would begin their activities for the Schneider Trophy by copying the wonderful qualities of the British victors and trying to follow them. They intended to compete for the trophy again at an early date.

CAPT. W. P. HALL, M.P., proposed "The Italian and British Air Services." Air Commodore Higgins replied for the R.A.F. and Col. Bernasconi for the Regia Aeronautica.

At the invitation of the Lord Mayor Flg. Off. Waghorn also made a brief speech.

THE LAST WINNER.—Flt. Lt. Webster, Winner in 1927, watching from the "Orford" the smashing of his records.

THE WORLD'S SPEED RECORD.

On Sept. 10 the Royal Air Force succeeded in beating handsomely the World's Speed Record held by Major de Bernardi at 318 m.p.h.

The two pilots chosen to make the attempts were Sq. Ldr. Orlebar, the Officer Commanding the High Speed Flight, and Flt. Lt. Stainforth, the reserve pilot for the Schneider Trophy Team. The former flew the Supermarine-Rolls Royce S.6 and the latter the Gloster-Napier VI.

Flt. Lt. Stainforth made the first attempt and covered the 5-kilometre course five times. His best four laps were as follows: 351.3 m.p.h., 328.3 m.p.h., 336.2 m.p.h., and 329.3 m.p.h., making an average speed of 336.3 m.p.h.

Sq. Ldr. Orlebar made four flights over the course and his speeds were:—368.8 m.p.h., 345.3 m.p.h., 365.5 m.p.h., and 343.7 m.p.h.—making an average of 355.8 m.p.h.

Bad visibility made accurate flying difficult, and fresh attempts were to be made later in the day.

The Supermarine S.6 was being fitted with a new airscrew, when the message reported above was telephoned by THE AEROPLANE's representative at Calshot.

PERADVENTURE.

Dead Past, nor a dumb Hereafter, let no man vex in vain;
Only our loosing laughter keep for our changeless gain;
Star-gift, and the life-sweet looted; the loves and the roses' musk
(And hidden the hopes unfruited in the day-forgiving dusk).
Be the reckoning all as the rueing, foredone where the Moment stands,
For this is our Noon of Doing, and nothing shall stay our hands.
And the losing or winning never, nor hap of the judgment won,
Shall count in our stark endeavour, but only the race we run.

G. DE H.-S.

THE ROYAL AIR FORCE.

The London Gazette.

September 3.

ROYAL AIR FORCE.

GENERAL DUTIES BRANCH.—Plt. Off. R. C. Warner is promoted to the rank of Flg. Off. (June 30).

Wing Cdr. H. Blackburn, M.C., A.F.C., is placed on the retired list (Aug. 29).

Lt. J. F. M. Robertson, R.N., Flg. Off., R.A.F., ceases to be attached to the R.A.F. on return to Naval duty (Aug. 16).

ACCOUNTANT BRANCH.—Sq. Ldr. E. W. Gregory, M.C., is placed on the half-pay list, Scale A., Aug. 31, to Nov. 4, 1929, inclusive.

MEDICAL BRANCH.—The following Flg. Offs. are granted perm. comns. in this rank (Sept. 4):—G. H. J. Williams; J. C. Neely, B.A.; J. Kemp, M.B. Flg. Off. J. M. Ritchie, M.B., is promoted to the rank of Flt. Lt. (Sept. 1). Flg. Off. A. C. Lysaght resigns his S.S. comn. (Sept. 3).

CHAPLAINS' BRANCH.—The following Chaplains are promoted to the relative rank of Wing Commander:—The Rev. M. H. Edwards, O.B.E., B.A.; the Rev. C. A. B. Allen, M.A. (Aug. 6); the Rev. G. H. Collier, M.A. (Aug. 12).

RESERVE OF AIR FORCE OFFICERS.

GENERAL DUTIES BRANCH.—The following Plt. Off. on probation of the Special Reserve are confirmed in rank:—P. F. Canning (June 8); G. D. S. Horsfall (July 2). The following Flg. Offs. relinquish their commissions on completion of service:—W. J. McDonough (Feb. 22); J. Spooner (Aug. 27). Flt. Lt. H. M. Ireland, D.F.C., relinquishes his commission on completion of service, and is permitted to retain his rank (Aug. 5). Flg. Off. H. Tulloch relinquishes his commission on account of ill-health, and is permitted to retain his rank (Sept. 4). The commission of Plt. Off. on probation R. P. Donnelly is terminated on cessation of duty (April 21).

MEDICAL BRANCH.—Flt. Lt. J. D. Driberg is granted a commission in Class D.D. (Aug. 20). Sq. Ldr. H. Harvey relinquishes his comn. on completion of service, and is permitted to retain his rank (Aug. 1).

AUXILIARY AIR FORCE.

MEDICAL BRANCH.—No. 601 COUNTY OF LONDON (BOMBER) SQUADRON.—Flt. Lt. J. D. Driberg resigns his commission on appointment to the Reserve of Air Force Officers (Aug. 20); Flt. Lt. E. D. W. Reid is transferred from General Duties Branch (Aug. 21).

Flight Cadetships and Scholarships.

The Air Ministry announces that Aircraft Apprentices N. C. S. Rutter, S. C. Widdows, and C. W. Williams, from No. 1 School of Technical Training (Apprentices), Halton, and Aircraft Apprentices A. D. Messenger and F. C. Daubney, from the Electrical and Wireless School, Flowerdown, have been selected for cadetships at the R.A.F. College, Cranwell, on the result of the examinations held on completion of their three years' training as aircraft apprentices.

"Sir Charles Wakefield" Scholarships valued at £75 each have been awarded to Flight Cadet J. R. MacDonald on the result of the recent competitive examination for entry into the R.A.F. College, and to Flight Cadet N. C. S. Rutter. T "Hyde-Thomson Memorial Prize," valued at about £2 has been awarded to Flight-Cadet A. D. Messenger.

No. 13 (Army Co-operation) Squadron.

The Headquarters of No. 13 (Army Co-operation) Squa ron, which has been temporarily located at Odiham, clos on Aug. 17, and re-opened at the R.A.F. Station, Andov on Aug. 19.

Central Flying School Categories.

The following officers and airman pilots have been categorised, as follows, from the dates against their name

A.2 TO A.1.—Fl.-Off. the Earl of Bandon, Aug. 15; 973 F Sjt. McCleery, W. R., Aug. 15; 352302 Sjt. Bonar, E. V Aug. 15.

B. TO A.2.—Fl.-Lt. F. W. Long, Aug. 23; Fl.-Off. G. Walker, Aug. 15; 318362 Sjt. Jurdon, J. E., Aug. 15.

The Late Flight Lieutenant Kinkead.

Air Vice-Marshal F. R. Scarlett, C.B., D.S.O., who w Chairman of the Kinkead Memorial Committee, has ceived a letter from Mrs. Kinkead, the mother of the la Flight-Lieutenant S. M. Kinkead, D.S.O., D.S.C., D.F.C expressing her deep appreciation and regretting that s is unable to thank individually all those who subscribed the Memorial, and asking him to convey her thanks to al

ESAVIAN Folding & Sliding DOORS

FOR

AEROPLANE HANGARS

ESAVIAN Folding & Sliding DOORS

The Unique Principle

The Esavian Folding and Sliding Doors are hinged to **Sliding Uprights** (patented) These uprights slide with the greatest ease, being fitted with purpose made Ball-Bearing Runners which carry the weight of doors of any height. Esavian Doors over 20 feet high can be fitted with Winding Gear (patented) so that they can be opened by one man.

The Test

Esavian Fittings have been supplied to the Government for Doors to cover over **Ten miles** of openings. These openings vary in height up to 32 feet and in length to 100 feet. Esavian Doors were fitted to the Hangar at Heston Aerodrome, 19 feet in height and 100 feet in length, and are also being supplied to Hanworth Park.

Esavian Doors, 32 ft. high and 70 ft. long, fitted at Henlow Aerodrome.

THE LIGHT AEROPLANE AND THE FLYING CLUBS.

THE CLACTON DISPLAY.

The third Air Display organised by the Brooklands School of Flying was held at their Clacton Aerodrome on Aug. 28.

Beginning at 11.00 hrs., a huge crowd, which overflowed all the enclosures and eventually surrounded the aerodrome, were thoroughly entertained throughout the day by a continuation of events following closely on each other.

The proceedings were opened by the Chairman of the Clacton Council (Councillor J. E. Ball, J.P.), who severed a ribbon tethering Capt. E. A. Jones's Avro, releasing it to lead a formation flight over the sea-front and town. Two Siskin machines then appeared overhead and whetted the crowd's appetite by giving a display of loops and slow rolls.

Sir Horace Plunkett, Bart., a member of the Senate of the Irish Free State, flew over from Brooklands accompanied by Capt. H. D. Davis, A.F.C., the Managing Director of the School. And other visiting pilots included Mr. Mok, a Chinese graduate of the Brooklands School. Mr. George Murray, who gave a splendid display of aerobatics; Messrs. Broad and T. Rose (of Pratts), Miss Winifred Spooner, Mr. Nieuwenhuizen and Mr. Hanstock. Mr. G. De Havilland, Junior, also paid a flying visit.

Bombing exhibitions were given by Capt. Davis, Capt. Jones and Mr. Murray, and several direct hits were made on a car and motor-cycle combination.

Mr. Broad then gave a splendid display of aerobatics in his usual expert manner, and Mr. John Tranum made a wonderful parachute jump into the middle of the aerodrome from Capt. Davis' Moth, in spite of a badly damaged ankle, sustained in a motor-cycle accident two days previously. The crowd thoroughly appreciated his sportsmanship in jumping despite this disability and gave him the reception he deserved when taken round the enclosures.

On the whole the Display was highly successful in every respect and is certain to be followed by others.

It will be remembered that the first Display was held at Brooklands and the second at Maidenhead.

THE LAST CIVIL MEETING AT FILTON.

The Bristol and Wessex Aeroplane Club will be holding an aerial Garden Party at Filton on Sunday, Sept. 22, to celebrate their successful tenure before moving during the coming winter to take over the new municipal aerodrome on the south side of the town.

Filton is now a Royal Air Force station and it is hoped that many who have visited the club in the past will come once more. All visitors will be assured of a hearty welcome and will be the guests of the club during the day.

There will be a bombing competition and various displays, including the Autogiro. Mr. H. S. Broad has also promised to give a show.

All entries for the competition will be made on the aerodrome.

TEACHING OUR ARYAN BROTHERS TO FLY.

The following has been extracted from the letter of a correspondent who is a member of a flying club in the East.

Almost all the Indians at the Flying Club were n.b.g. and I have seen Blank the Instructor come in and after struggling for words for a few seconds inveigh against some pupil for twenty minutes without repeating himself. Our particular pet was a Babu whom we will call after Mr. Kipling's hero, Huree Chunder Mookerjee, and those of us who were privileged to be present will never forget the last morning he turned up at that aerodrome. He had done about twelve hours' dual at another Club and about ten hours at this one (and walked about the town all day wearing flying goggles and a flying topi with the 'phones hanging down in front—a really good advertisement for the Club!).

On this particular morning the wind was coming bang across the tarmac towards the hangar. Blank and Mookerjee climbed in, the former looked at me and raised his eyes to Heaven and told the other to take off. Mookerjee started off in the right direction about as slowly as the plane would taxi and had a good look at the circle and went round it,—to make sure it was all right presumably,—and then slowly went on till he came to the high trees on the far side of the flying ground. Blank, sitting in the front cockpit just behind the engine—very nice when the sun is 140° in the open—said nothing,

CUTTING IT CLOSE.—A Moth at Clacton in the Bombing Competition.

Digitized by Google

AT CLACTON.—Sir Horace Plunket and Capt. Davis of the Brooklands School.

so he turned round and came back again. When he was *twenty yards* from the hangar he opened out suddenly and tried to take off, *down wind*. How Blank pulled her down and round I do not know.

Well, for a quarter of an hour he taxied round, occasionally opening out and doing a ten yards hop down or across wind. Finally Blank got fed up and took the plane up into the air. When he got about 100 feet up he gave over control again, and Mookerjee, under the impression that he had got a Westland Wizard or summat, tried to climb at 60 deg. When Mookerjee tried to land he hurtled over the aerodrome—bang over it—200 feet up at about 60 m.p.h. and nearly hit some scrub out in the desert. Blank asked "What the hell are you doing?" "I am looking for the aerodrome, Captain," replied Mookerjee.

THE DELHI FLYING CLUB.

The membership of the Delhi Flying Club on Aug. 1, 1929, was 189. Five new members joined in May, eight in June, and five in July.

The effect of the hot weather on the Club's operations has been distinctly bad. During the greater part of May a hot and dusty wind blew during the afternoons, and the flying hours in the mornings were spoilt by a heavy bank of hot dust hovering in the air about 1,000 feet above the aerodrome June was even worse. During the month there were only 13 days' flying.

The total number of hours flown, including dual instruction, solo flights, pleasure flights, and tests, were: May, 44 hours 30 minutes; June, 20 hours 25 minutes; July, 49 hours 50 minutes.

A new bye-law has been adopted by the Club which forbids any member or non-member to fly a Club machine for gain or reward without express authority.

In May, an appeal was made for funds to buy another Gipsy Moth aeroplane for the Club. Sir Victor Sassoon has offered to pay one-quarter of the cost if the balance is collected by Sept. 30.

The Hon. Secretary of the Delhi Flying Club is Major C. M. Grant Govan, the Instructor is Mr. Alan I. Riley, A.F.C., who is understood to have been formerly test pilot for the Westland Aircraft Works, and Vickers, Ltd., and the Ground Engineer is Mr. Clifford.

SIR CHARLES THE MUNIFICENT.

Sir Charles Wakefield, whose beneficence in the interests of Aviation is World-famous, recently offered a D.H. Moth to be competed for by the principal Indian Flying Clubs.

This machine has been won by the Bombay Flying Club who have sent Sir Charles the following cablegram:—

"The Chairman and members of the Bombay Flying Club having won the gift of the Moth aeroplane, express their grateful thanks for your munificent award for the furtherance of civil aviation in India."

Learn to fly at HANWORTH

THE London Air Park at Hanworth, headquarters of the N.F.S. flying organisation, is the ideal instructional centre, where the flying pupil may qualify for the Air Ministry "A" Licence for private pilots, quickly and at the minimum of expense.

Experience shews that the average flying member is able to "pass out" after a period of from 13 to 20 hours training. The minimum under N.F.S. rules is eight hours "dual" instruction, and five hours "solo" flying, the cost of this minimum course being under £25.

Not only is Hanworth one of the largest air parks in the country, but as a Country Club it is unexcelled. The Club itself provides first-class residential accommodation; lounges, dressing and drawing rooms, writing room, ballroom and an excellent standard of catering. Tennis and squash racquets courts provide facilities for outdoor recreation. The Hanworth estate covers an area of 230 acres.

A limited number of members are now being enrolled at the following rates: Flying Members, 5 gns. entrance fee, and 5 gns. annual subscription. Non-flying Members, 3 gns. in each case. For 1929, two-thirds of the annual subscription is rebated. Serving Officers of H.M. Regular Forces are admitted without entrance fee. Membership of Hanworth Club confers honorary membership of all other N.F.S. Clubs, and free use of every N.F.S. station. Private flying for qualified members costs as little as £1.1.0 an hour (3½d. a mile). Residential terms at Hanworth range from 5½ to 7 guineas per week.

Write to-day for the N.F.S. brochure that fully describes the privileges of membership and enumerates the services offered to all who wish to fly.

COMMERCIAL AERONAUTICS.

THE "GRAF ZEPPELIN."

The *Graf Zeppelin* landed at Friedrichshafen on Sept. 4 at 8.48 hrs. after completing the journey from Lakehurst to Friedrichshafen in 67 hours 35 minutes.

The *Graf Zeppelin* flew round the World from Lakehurst to Lakehurst in 21 days 7½ hours and from Friedrichshafen in 20 days 4 hours. These times quite put Jules Verne's dream of Round the World in 80 days in the shade.

As a result of the *Graf Zeppelin's* transatlantic flights and the interest thereby aroused on both sides of the Atlantic the possibilities of a transatlantic airship service appear somewhat closer.

The Goodyear-Zeppelin Company of America are about to build two airships, which have already been designed, and the German company, the Luftschiffbau Zeppelin is proposing to build two. The American-built airships are to be used for a Transpacific Service and the German for Transatlantic use.

THE LOSS OF THE "CITY OF JERUSALEM."

The *City of Jerusalem*, a three-engined D.H. Hercules belonging to Imperial Airways Ltd., crashed while making a night landing at Jask on Sept. 6. The pilot, Captain A. E. Woodbridge, Mr. V. G. Bell, of the Malay States Forestry Dept., who was a passenger, and Mr. J. Court, of Imperial Airways, were killed. Mr. H. Bourne, the wireless operator, and Mr. H. C. Amor, the engineer, received burns, but are now progressing satisfactorily. They are expected to leave for Karachi by the first steamer.

The *City of Jerusalem* appears to have been late in arriving at Jask and therefore the pilot found it necessary to ignite the wing-tip flares for landing in the dark. One of these flares seems to have set fire to the wing and thus caused a crash by burning away the wing-tip and aileron on that side.

Lord Thomson, Secretary of State for Air, has sent the following telegram to Sir Eric Geddes, Chairman of Imperial Airways, Ltd:—"Air Council learn with profound regret of accident to air liner at Jask and loss of three lives involved."

The Postmaster-General announces that as a result of the accident the outward-bound Indian mail which left this country on August 31 has been totally destroyed.

AN AMERICAN AIR LINE DISASTER.

The wreckage of a Ford Tri-motor Monoplane belonging to Transcontinental Air Transport Lines, the *City of San Francisco*, was discovered near the top of Mt. Taylor, New Mexico, on Sept. 8.

The machine had been missing since Sept. 3 when it left Albuquerque, New Mexico, for Los Angeles.

Five passengers and the crew of three were all dead.

The aeroplane appears to have been forced from her course by a storm and to have struck the hill-top while travelling at full speed.

The wreckage caught fire, and reports say that the metal fuselage was destroyed. This seems probable, as aluminium burns fiercely when subjected to intense heat.

"THE AIR PILOT."

Volume I of the 1929 edition of *The Air Pilot* has now been published by H.M. Stationery Office from whom it may be obtained or from THE AEROPLANE Book Dept., Cannon House, Pilgrim Street, E.C.4, at the price of 12s. 6d. net.

As a result the Monthly Supplements have ceased with the issue of No. 55. A new series of supplements, entitled *The Air Pilot (Volume I) Monthly Supplement*, will be published, the first number of which will appear in September.

The loose-leaf system of binding has been retained for the 1929 edition, so as to facilitate the insertion of amendments and additions. An alphabetical index has been included.

A CALCUTTA FOR FRANCE.—On Sept. 3 a Short Calcutta 14-passenger flying-boat (three Bristol Jupiter engines) which has been ordered by the French Government was tested at Rochester prior to being handed over. In the group above are, from left to right: Capt. Mayer of Short Bros., M. de Fleuriau, the French Ambassador, Lieut. de Vaisseau Sala, the French Air Attaché, Mr. Oswald Short, Managing Director of Short Bros. Ltd., and Mr. Mayer of the Bristol Company.

The new volume is divided into two parts. The first is devoted to Great Britain and Northern Ireland, the second to the Irish Free State. Under the headings of *General Information, Pilotage Directions, Meteorological Services, Radioelectric Services,* and *Air Stations,* is a mass of information which is necessary to all concerned with air pilotage.

CIVIL AIR MAPS OF GREAT BRITAIN.

Air Ministry Notice to Airmen No. 5 of the year 1929 announces the placing on sale of certain additional sheets of the civil air maps of Great Britain. These are as follows:—

(i) *The Ordnance Survey Ten Mile Map of Great Britain (Special Air Edition).*—

Sheet 1.—That portion of Scotland lying N. of Latitude 55°40/N.

(ii) *The ¼ inch Ordnance Survey Map of England and Wales (Civil Air Edition).*—

Sheet 5.—That portion of England and Wales lying between Latitudes 52°34/N. and 53°36/N., and between Longitudes 0°45/W. and 3°21/W.

Sheet 6.—That portion of England lying between Latitudes 52°32/N. and 53°36/N., and E. of Longitude 0°45/W.

Sheet 8.—That portion of England and Wales lying between Latitudes 51°32/N. and 52°34/N., and between Longitudes 0°48/W. and 3°20/W.

Sheet 9.—That portion of England lying between Latitudes 51°30/N. and 52°32/N., and E. of Longitude 0°48/W.

Sheet 11.—That portion of England and Wales lying S. of Latitude 51°32/N., and between Longitudes 0°50/W. and 3°19/W.

Copies of these maps may be obtained through the usual agents or through The Aeroplane Book Dept., Cannon House, Pilgrim Street, E.C.4.

MEMENTO MORI.

A memorial to the late M. Maurice Bokanowski, the former French Minister of Air, who was killed in a flying accident, was unveiled at the Ministry of Air in Paris by M. Laurent-Eynac, the present Minister, on Sept. 2.

It was the death of M. Bokanowski which considerably accelerated the reorganisation of French Civil Aviation resulting in the purchase of foreign-built aircraft for use by the subsidised French Air Lines,—to encourage French constructors.

THE KAITAK AERODROME, HONG KONG.

A *Reuter* message from Hong Kong dated Sept. 5 states:—

In the Legislative Council to-day the Colonial Secretary announced that the Air Ministry would co-operate in the building of a shed hangar at Kaitak Aerodrome. The contributions of the Imperial Government towards the construction would amount to £100,000.

A ROYAL PATRON FOR HULL.

It is stated that Prince George, who is to be present at the air pageant arranged for the opening of civic week at Hull, will arrive and depart by air. He will fly from Croydon in the morning and land at the Hedon aerodrome.

THE JUNKERS C.I. ENGINE.

On Friday, Aug. 30, the Junkers aircraft fitted with the the Junkers compression-ignition oil-engine was sent on its first utility flight, from Dessau to Cologne. The flight was uneventful and took 3 hours non-stop.

SIGHT-SEEING FOR CHARITY.

King Edward's Hospital Fund for London have arranged for a special visit to the Air Port of London, at Croydon, on Saturday, Sept. 21, at 2.30 p.m.

The party will be conveyed by omnibus from Charing Cross Underground Station, Victoria Embankment, leaving at 2 p.m.

They will be able to witness the arrival and departure of Continental air liners and to inspect the control tower from which the taking-off and landing of outgoing and incoming aeroplanes are regulated, and the lighting equipment and movement of aircraft in the vicinity are controlled.

"SEA-CLIFF" Trade Mark.

C. Clifford & Son LTD

BIRMINGHAM.

Phosphor Bronze

IN ALL FORMS.

Non-corrosive. Hard as Steel.

Looks like gold.

Tickets, price 7s. 6d., can be obtained from the Secretary, King Edward's Hospital Fund for London, 7, Walbrook, E.C.4.

By arrangement with the Surrey Flying Services, visitors will be given an opportunity of taking short flights over the surrounding district at an additional charge of 10s. 6d.

WHAT A HOPE!

A report in *The Times* of Sept. 10 states that invitations have been issued by the French Aero Club to the British and Italian Air Departments to compete for a cup to be offered by the club at La Baule on Sept. 15 for racing seaplanes.

HOW TO PUSH A WIRE ROUND A CORNER.

All aircraft drawing offices and similar high-brow concerns interested in the production of better and better aircraft, know the sickening business of taking control systems round corners.

An extremely simple and ingenious gadget has been devised which makes bends and curves a positive holiday for the P.B.D. This device is now approved for use on British aircraft by the Air Ministry, and is known as the Arens Control, and is being looked after in this country by Mr. L. H. Freeman, of 52, Russell Square, London, W.C.1.

The Arens Control consists essentially of a flexible multi-strand, multi-lay wire cable, covered with a spirally wound wire cover (that is to say, essentially a Bowden mechanism), both of which pass through a brass tube bent through the required angle at a standard radius. The ends of the cable and wire cover are sweated to screwed studs for the attachment of the tubes of the control system.

When a compression load is put on the system, it is taken through the spirally wound cover, and when the system is in tension, the flexible cable takes the stress.

The Arens Control was produced in America, and a sufficiently impressive guarantee of the device's value is the fact that American aircraft firms of such calibre as Boeing Curtiss, Keystone, Wright, Laird and Fokker, all use the Arens Control.

The whole mechanism works very easily, and the losses due to friction are small, though forced lubrication of the grease-gun type can easily be fitted. The Arens Control can be made to suit any particular conditions, and can be designed to transmit loads through any complicated system of curves.

[Something very like it, but with a flexible outer casing instead of metal tube, was put on the market in 1903, or thereabouts, and gave a practical flexible push-and-pull mechanism. Unfortunately it was killed by the Bowden patent.—C. G. G.]

THE LONDON TERMINAL AERODROME.

ANALYSIS OF FIGURES FOR PAST WEEK.

Trips per Day.—Sunday, 24, Monday, 40, Tuesday, 41, Wednesday, 43, Thursday, 37, Friday, 37, Saturday, 34.

Imperial Airways Ltd.:

London—Egypt—India: London—Le Touquet—Paris—Basle—Zurich: London—Ostend—Brussels—Cologne and return: Machines 100, passengers 930, freight 36 tons. India Mail: inward, 4 passengers, mail 754 lbs., outward, 1 passenger, mail 726 lbs.

Air Union:

Paris—London and return: Machines 73, passengers 324, freight 26 tons.

K.L.M.:

Amsterdam—Rotterdam—London and return: Machines 28, passengers 207, freight 15¼ tons.

Sabena:

Brussels—London and return: Machines 13, passengers 71, freight 31 tons.

Deutsche Luft Hansa A.G.:

Amsterdam—London and return: Machines 26, passengers 66, freight 8 tons.

Miscellaneous:

British Machines 11, passengers 11.

Foreign Machines 5, passengers 2.

Total number of trips by British Machines 111, carrying 941 passengers. Foreign Machines 145, carrying 670 passengers.

COMPARATIVE FIGURES.

Week ending Sept. 7:
Machines, 256; Passengers, 1,611; Crews, 582. Total personnel, 2,193.

Corresponding week, 1928:
Machines, 227; Passengers, 1,423; Crews, 397; Total personnel, 1,820.

Corresponding week, 1927:
Machines, 144; Passengers, 941; Crews, 266; Total personnel, 1,207.

Corresponding week, 1926:
Machines, 167; Passengers 657; Crews, 193; Total personnel, 850.

Corresponding week, 1925:
Machines, 136; Passengers, 607; Crews, 184; Total personnel, 791.

Corresponding week, 1924:
Machines, 137; Passengers, 572; Crews, 165; Total personnel, 737.

Corresponding week, 1923:
Machines, 138; Passengers, 549; Crews, 223; Total personnel, 772.

Corresponding week, 1922:
Machines, 121; Passengers, 411; Crews, 215; Total personnel, 626.

Corresponding week, 1921:
Machines, 96; Passengers, 224; Crews, 120; Total personnel, 344.

Corresponding week, 1920:
Machines, 115; Passengers, 285; Crews, 142; Total personnel, 427.

AIRCRAFT FOR SALE.

Authorised Moth Agents.—Immediate delivery from stock. Demonstrations arranged.—Phillips and Powis Aircraft (Reading) Ltd., Reading Aerodrome. 'Phone Sonning 114.

G-AADC Coupé Gipsy-Moth, slotted wings. Done 150 hours. Just been overhauled. Complete with two 20 gns. compasses and Hot and Cold air supply and extra large locker. Offers to be made to Capt. W. R. Bailey, Cavalry Club. Machine can be seen and flown Stag Lane.

Mark IV Avian, 100 hours' flying, 8 months' old. £420. Southern Aircraft Ltd., Shoreham.

Parnall Pixie Monoplane. Bristol Cherub III. M/c: 16 hours. Engine: 241 hours. Fit for Flying, but C. of A. Expired. £150. Apply Bristol and Wessex Aeroplane Club Ltd.

SITUATIONS VACANT.

Experienced Jig and Tool Draughtsman required, with experience in Tooling for Metal Aircraft, including design of dies for draw benches and Rolls special Section Materials. Write stating age, experience and salary required, Box No. 5707, The Aeroplane, Cannon House, Pilgrim Street, E.C.4.

Section leader required on Aircraft. State age, experience and salary to Saunders-Roe Ltd., East Cowes, I.O.W.

Crown Agents for the Colonies. Colonial Government Appointments. Applications from qualified candidates are invited for the following posts. M/1328. Artisans qualified as Ground Engineers required for the Kenya and Uganda Government Railway for one tour of 20 to 30 months, with possible extension. Salary £300-£18-£360 a year. Free quarters and passages and liberal leave on full salary. Candidates, age 25 to 35, must be qualified Ground Engineers, holding an Air Ministry licence either in Categories "A" and "B" or "C" and "D." Apply at once by letter, stating age, whether married or single, and full particulars of qualifications and experience, to the Crown Agents for the Colonies, 4, Millbank, London, S.W.1, quoting M 1328.

Wanted for the Colonies. Experienced Aeronautical Draughtsman able to undertake detail and Component Design. Full particulars and salary required to Box No. 5710, The Aeroplane, Cannon House, Pilgrim Street, E.C.4.

Engineering fitter-erector with experience of aircraft construction required for Inspection Dept. Preference to applicants with Ground Engineer's Licence "A" or "B." Give full details of experience and state wage required. Apply in writing to Chief Inspector, Westland Aircraft Works, Yeovil.

AIRCRAFT PARK.

D. Watt, Brooklands Aerodrome, Byfleet 331. Houses machines and carries out overhauls of every description to aircraft and cars.

FLYING CLOTHING.

No Connection with any other Firm.

S. LEWIS'S.—The Old Firm of Flying-Racing and Motor Clothing Fame. 19 and 27, Carburton Street, London, W.1. We wish our Thousands of Customers to know we have no connection with any other Firm. Flying Helmets, best Quality, Fur trimmed, 14s. 6d., 12s. 6d.; All Leather Lined Chamois, 10s. 6d., 12s. 6d.; Flat Type Phones, 5s.; Metallic Tubing and Rubber Connection, 2s. 6d.; V Piece and Adapter combined, 3s. 3d.; White Flying Suits, 25s. 6d.; Ditto, with Lightening Fasteners, 35s.; White Combination Suits, 14s. 6d.; White Flying Helmet, 6s. 6d.; Featherweight type Goggles, fitted genuine Triplex Lenses, slightly tinted, new W.D., 7s.; Ditto, fitted genuine clear Triplex Lenses, 11s.; Aviation Mask Goggles, fitted genuine Tinted Triplex Lenses, 14s. 6d.; Ditto, fitted Tinted Triplex, 12s. 6d.; Meyrowitz Luxor Goggles, fitted Triplex unsplinterable lenses, 40s.; R.A.F. Scarf, 5s. 6d.; Pilot's Gauntlets, 12s. 6d. per pair; Suede Golf Jacket, best quality, ideal for flying, 50s. We are contractors to Foreign and Colonial Governments. S. Lewis's, 19 and 27, Carburton Street, London, W.1.

No Connection with any other Firm.

Wainwright's Flying Equipment.—Wainwright Flying Helmet (passed by A.M.) lined chamois, 22s. 6d., in Black or Tan, Fur trimmed helmets 12s. 6d., 15s. 6d. White helmets, pique or drill, 12s. 6d. Flat type earphones, complete with connections and "Y" pieces, 12s. 6d. Flying mask goggles, clear or anti-dazzle, 12s. 6d. Genuine R.A.F. Sidcots 57s. 6d. Chrome Leather flying coats, 84s. to £8 8s. Write for catalogue, Wainwright's, 300-302, Euston Road, London, N.W.1. 'Phone: Museum 6280.

Officers' Uniform R.A.F. Whipcord.—Excellent materials and workmanship. Jacket to measure £3 15s., slacks 30s., suit £5. Kings, Madeira Walk, Ramsgate.

Established over 30 years.

AERODROME LIGHTING.

Mobile combined Beacon Floodlights, Emergency Signalling, Navigation, High Intensity, Lenses, Carbons, Strands, Cords. The London Electric Firm, Croydon.

AIRCRAFT REPAIRS.

No job too small or too large. Complete reconditioning for C. of A. Full certificated staff—keenest rates. Brooklands School of Flying, Brooklands, Byfleet.

AIRCRAFT WANTED.

Aircraft purchased for cash. Cars taken in exchange for aircraft. Deferred terms.—Phillips and Powis Aircraft (Reading) Ltd., Reading Aerodrome. 'Phone Sonning 114.

AVIATION INSURANCE.

Aircraft Comprehensive Insurance.—Aeroplane owners requiring Insurance covering damage, 3rd party, occident and life *should first consult* Services and General Insurance Agency, 108, Victoria Street, Victoria, S.W.1. *Special terms according to experience.*

Advice given and rates quoted.—Apply to **Bray, Gibb and Co., Ltd., Aviation Dept., 166, Piccadilly, London, W.1, and 14, Sherborne Lane, E.C.4. All classes of Insurance effected.**

PRACTICAL FLYING.

HENDERSON FLYING SCHOOL.—Lt.-Col. Henderson offers unique terms both for "A" and "B" licences. All technical coaching arranged for. Personal attention. Minimum rates. Write to Croydon Aerodrome.

CINQUE PORTS Flying Club (Subsidised) gives cheapest tuition ever offered. Monthly sub. 21s. for 28 days. (No entry fee.) Annual subscription 63s. (entrance 21s.). Moth equipment—Club-room, Bar and Lawn—Perfect Aerodrome near Folkestone, 1¾ road hours from West-End. No waiting list. Write Secretary, Hythe, Kent,—**LEARN AT LYMPNE.**

CHEAPEST FLYING IN THE WORLD! at the Norfolk and Norwich Aero Club. Subscription **£3 3s.** Instruction rates **25s.** per hour. Accommodation can be arranged on Aerodrome. Applications to Secretary, Mousehold Aerodrome, Norwich.

Learn to Fly at the Midland Aero Club. Four tuition machines, two fully qualified expert instructors. No waiting. Particulars Hon. Secretary, 22, Villa Road, Handsworth, Birmingham.

Phillips and Powis School of Flying.—An "A" license in the shortest time and the lowest cost at Reading. Personal attention, no waiting, concentrated instruction. The school is very successful in turning out good pilots in a minimum of time. Write for particulars of recent successes. Make it a flying holiday. Special offer, trial lesson 12s. 6d. 45 minutes Paddington.—Reading Aerodrome. 'Phone Sonning 114.

Surrey Flying Services, Croydon Aerodrome (Telephone Croydon 1736) have vacancies in their flying school for pupils at moderate rates. Avro Aircraft used. Residential accommodation at Aerodrome Hotel.

Southern Aero Club.—Thorough Avro Tuition, no waiting list. "B" licences instruction arranged. Apply Secretary, Shoreham Aerodrome, Sussex.

The De Havilland School of Flying, Stag Lane Aerodrome, Edgware, Middlesex. Fourteen machines: Nine Moths, five advanced training machines. Seven Pilot Instructors. Lecture Classes, Restaurant and Recreation Pavilion. The largest and most up-to-date civilian organisation for flying tuition in the British Empire.

SITUATIONS WANTED.

Pilot "B" Licence, now free. Good references.—Apply Box No. 5701, The Aeroplane, Cannon House, Pilgrim Street, E.C.4.

Pilot-Salesman, can fly any type, over 2,000 hours. Near London preferred.—Apply Box No. 5706, The Aeroplane, Cannon House, Pilgrim Street, E.C.4.

Ground Engineer offers services to individual, club, or firm. Accept small salary if taught to fly. Sound maintenance experience, indentures. Good references. Apply Box No. 5711, The Aeroplane, Cannon House, Pilgrim Street, E.C.4.

G.E. Licensed "A" and "C" (Gipsy and Cirrus) requires situation abroad in any capacity, nine years' experience. W. M., 20, Osborne Avenue, Salford.

Young Man, 25, well-educated. 7 years' commercial experience, desires any position to obtain start in aviation. Box No. 5709, The Aeroplane, Cannon House, Pilgrim Street E.C.4.

Private Owners, Flying Clubs and Schools—"B" Licence Pilot, extensive experience, instruction and cross-country flying, requires post. Now free. Excellent credentials. Box No. 5708, The Aeroplane, Cannon House, Pilgrim Street, E.C.4.

AIRCRAFT CAMERAS.

"Eagle" Aircraft Cameras and Equipment. Specialists in air photographic apparatus. Particulars from the manufacturers and patentees, Williamson Manufacturing Co., Litchfield Gardens, Willesden Green, London, N.W.10. Telephone 0073-4 Willesden. Telegrams, "Kinetogram Willroad London." Contractors to the Admiralty, Air Ministry, War Office.

THE R.A.F. TROOPING SEASON.

R.A.F. personnel going overseas should advertise their cars, motor-bicycles, wireless sets and other unwanted gear in The Aeroplane, where it will be seen by everybody else in the Service, including those posted to the Home Establishment.

MISCELLANEOUS.

Petrolmotor Castings, partly machined, ½ horse (9s. 9d. per set). Catalogue 3d. Madison's Works, Wade Street, Littleover, Derby.

A Guest House.—Mrs. Rogers, 25, Castlenau, Barnes, S.W.13, has a few vacancies, single and double rooms. 25 minutes from Piccadilly Circus. Tennis Court. Recommended by Service people. Telephone, Riverside 3371.

Lt.-Col. G. L. P. Henderson, being unable to compete with Subsidisation and monopoly by continuing instruction at commercial rates, begs to announce the inauguration of a new flying Club for South London with a magnificent aerodrome at Addington on the 1st of October. Instruction will be given at competitive rates and every facility given to private owners for garage and repairs. All communications for particulars as to membership, etc., to Lt.-Col. G. L. P. Henderson, Croydon Aerodrome.

"Chequers Inn," Slaugham, Board Resident. Golf and coarse fishing half-mile. London 35 miles. Brighton 17 miles. Proprietor.

YOU'LL GET A BETTER BID FOR YOUR MACHINE AT BROOKLANDS

Send full particulars of your second-hand aircraft to the Brooklands School of Flying. You'll get a better bid for it there. And a better deal when you buy a new plane in part exchange for your own. The School's Sales Manager knows the second-hand market intimately and pays the full market price.

BECOME OWNER PILOTS FOR £236 10s.—Buy your new Moth at Brooklands—Official D.H. Agents. Through its important financial connections the School can sell on specially attractive hire purchase terms. Pilots can take a Moth from the Show Room and fly it away on the payment of £236 10s., which includes Insurance.

SERVICE AFTER SALES.—To those who buy their new Moths from us we offer FREE SERVICE for the first month. The life of an engine depends on its treatment during this period.

REPAIRS AND OVERHAULS.—The School has extensive workshops and undertakes all repairs and overhauls for C. of A.

SPECIAL CHARTER.—Four-seater Saloon machine available at shortest notice. Any distance.

FIRST-CLASS TUITION.—Flying tuition at Brooklands is *not* cheap. Yet, since June, 30 pupils have found that to be well taught *pays* in the end.

Sound instruction depends on the experience of the Instructor. The following are responsible for the high standard of flying at the School: H. D. Davis, A.F.C., Managing Director and Chief Instructor; E. A. Jones; C. M. Pickthorn, M.C.; J. R. King; R. Y. Bush, who between them have done 14,250 hours' flying.

Ring up Byfleet 437 to fix a trial lesson—or write to

BROOKLANDS SCHOOL OF FLYING BYFLEET, SURREY.

The Aerodrome is forty minutes from Waterloo. Five minutes' walk from West Weybridge Station. Trains every hour.

U.S.A., 1 Year, $8.50. Entered as second class matter at the New York (N.Y.) Post Office.

ON GETTING BACK TO WORK.

There is a legend, which like all other legends probably has some standing on fact, that when, after winning the Schneider Trophy at Venice in 1927, Squadron Commander James Bird and Mr. R. J. Mitchell returned to Southampton, to be received on their arrival by the Mayor and Corporation complete with bands and banners, as they stepped out of the railway carriage Sq. Cdr. Bird turned to Mr. Mitchell and said "Now Mitchell, we have finished with all this nonsense and we can start doing some real work." Whether the story is true or not the sentiment should be taken to heart at this moment by the British Aircraft Industry.

Besides the fresh glory which has been deservedly added unto the Supermarine firm by Mr. Waghorn's victory, and by Mr. Atcherley's records for 50 kilometres and 100 kilometres, and by Sq. Ldr. Orlebar's records for absolute speed over the straight three kilometres, the whole British Aircraft Industry shares in the reflection of that glory. British aircraft and British aero-engines have received a World-wide advertisement. And now is the Heaven-sent chance for our Industry to get to work and profit by that advertisement.

To Whom The Honour.

The British Aircraft Industry owes a deep debt of gratitude to Mr. Mitchell and to Mr. Royce for designing the aeroplane and the engine which have given us that advertisement.

With them must be joined Sq. Cdr. Bird, Chief Director and Mr. Hunn, the Works Manager of the Supermarine Works, and the Directors of Vickers (Aviation) Ltd., who, though they acquired the Supermarine Company after the winning machine had been designed and very largely constructed, have shown themselves as enthusiastic in their support of the Supermarine projects as if those projects had originated in Vickers House. Also we should acknowledge the work of Mr. Sidgreaves, the new Managing Director of Rolls-Royce Ltd., who has backed up so thoroughly the efforts of that great engine firm.

Hardly less gratitude is due to Mr. Wilkinson of the Napier Company and to Mr. Folland of the Gloster Company for the designs which produced the graceful Gloster-Napier machines. Though they did not win or capture records they did at any rate show a remarkable advance on

"IN THE RACE HE EQUALLED ALL THE PROMISE OF HIS FORM IN THOSE HIS ROUNDS, AND SO WITH NOBLEST PRIZE OF CONQUEST LEFT THE GROUND."—(Sophocles—*Electra*, 687.)

"THIS WAS WELL DONE!"—Sq. Ldr. Orlebar descending from the Supermarine-Rolls-Royce S.6 in which he beat the World's Speed Record on Sept. 10 (and beat it again on Sept. 12). Sq. Ldr. Orlebar remained in the cockpit while the machine was towed in.—(*"Aeroplane" photograph.*)

Digitized by Google

Mr. R. J. Mitchell and Mr. F. H. Royce.

the performance of two years ago. Considering that the Napier Lion, which is a small engine compared with its great competitor, has apparently something between 500 and 700 less horse power it has put up a truly remarkable performance. The immense difference in power only shows how heavily we have to pay for added speed.

With them must be associated Mr. David Longden, who is the controlling power of the Gloster Company, and Mr. H. T. Vane of the Napier Company. And we must not forget Mr. Montagu Napier who, living in the South of France because of his health, yet manages to play a very important part in the technical developments of the Napier firm.

But there is one other man whose name, so far as one can remember, has not been mentioned in the praises which have been poured so deservedly on all who have had a hand in our victory. That is Mr. A. J. Rowledge, the chief of the design staff of Rolls-Royce Ltd. He cannot be allowed to pass unhonoured and unsung.

Mr. Rowledge is in the curious position of having been intimately concerned with the designs of both the Napier Lion and the new Rolls-Royce engines. While the Lion was being developed in the early years after the War, Mr. Rowledge was Chief Designer of the Napier firm. In 1921 he joined the Aero Engine Department of Rolls-Royce Ltd. and has been largely responsible for the development of the "F" type engine, which gave such a good impression on its first appearance at the R.A.F. Display a year ago and has since proved itself to be one of the finest engines in the World.

From the "F" engine has been developed the "H" engine, which is now coming into use as one of the R.A.F.'s chief high-powered engines, and from the "H" engine is more directly developed the "R" engine which was used in the Schneider machines.

Mr. Rowledge is such a retiring individual, and so seldom appears in public, that he is nothing like as well-known as he deserves to be. But on such an occasion as this he deserves full acknowledgment for his share in developing what are probably the two finest water-cooled aero-engines in the World.

MR. ROYCE.

Quite one of the most remarkable features of this recent orgy of high-speed development is the work of Mr. Royce himself. As his photographs show, Mr. Royce is by no means a young man. He was not a young man even when the late the Honourable Charles Rolls first induced him to make a motor-car at Derby in 1904. At that time Mr. Royce had already a high reputation as a builder of steam cranes.

His ideas of first-class workmanship, and the ideas of Charles Rolls on what a motor-car ought to be, produced what is acknowledged in all countries to be the World's finest motor-car. When the War came and the Rolls-Royce Company began building aero-engines they produced the Hawk, the Falcon and the Eagle engines,—which for reliability were the equal of any motor-car ever produced.

But Mr. Royce in those days apparently believed that excellence in aero-engines was to be got by a multiplicity of parts. There certainly was not a better engine in the World than the war-time Rolls-Royce. And there certainly never was an engine with so many parts to it. Where the Germans held a cylinder on by four large bolts, the cylinders of a Rolls-Royce were held by innumerable small studs. And where an American engine drove its ignition with a piece of flexible steel or a leather disc or a lump of rubber, the Rolls magnetos had an arrangement of worm-gears and internal- and external-splined shafts which must have cost nearly as much as a cylinder for machining.

Nobody was ever so prodigal in the expenditure of labour, but nobody ever got such results from it. To-day Mr. Royce might be described, with all due respect, as a reformed prodigal, and he is apparently all in favour of simplicity. Like Mr. Bill Stout, of Ford Aircraft fame, he seems to believe in the motto "Simplicate and add more lightness."

Those who have admired Mr. Royce's work for so many years will be glad to learn, on the authority of one of Mr. Royce's intimate friends, that so far from having any idea of retiring on his well-earned reputation, Mr. Royce has never been so full of ideas for the development and improvement of internal combustion engines as he is to-day, and that he has never had so great a capacity for work. Let us hope that for many years to come Mr Royce will continue to add to the honours of British aeronautical engineering.

SOME TECHNICAL GUESSES.

Though a definite specification of the winning Supermarine Rolls-Royce S.6 is not available, an American aircraft designer who has nothing to do with the machine or its engine has worked out a few figures about it which may be interesting.

His method of arriving at these figures is rather amusing. He takes the known performance of the machine, and a few minor facts which he has observed, and then constructs the machine from these details much in the way that archæo-zoologists construct a whole Brontosaurus from the odd tooth or toe-nail.

He says that the machine weighs about 5,100 lbs. loaded and that its wing loading is about 30 lbs. per square foot. The airscrew is about 3 metres (or 9 feet 9 inches) in length, with a pitch of 18 feet, and that it runs at about 1,400 to 1,500 r.p.m.

The Rolls-Royce "R" engine, he calculates, must have been giving about 1,500 h.p. in the Contest, running partly throttled down as it was, and it used about 95 gallons of petrol,—not including that consumed by Mr. Waghorn in going the extra three-quarters of a lap.

The compression ratio of the engine is 5.75 to 1, which for a racing engine is very low. But it is supercharged up to 11 lbs. per square inch,—on top of the ordinary atmospheric pressure of 15 lbs. per square inch. This, he says, is equivalent to flying at 16,000 feet *below* sea-level.

As the Gloster VI did not compete for the Trophy our friend was not so much interested in it, but he says that it weighs about 3,700 lbs. loaded, and that the Napier Lion gives about 1,250 h.p.

These figures do not pretend to be accurate, but they are probably not very far wide of the mark.

THE ITALIAN TROUBLES.

Details of the Italian machines are practically ungetable, but there are one or two points about them which are worth discussing, because they have at any rate something to do with their failure.

About the most notable fact about the two big Macchis (the 67s) in the Schneider Contest was that in spite of the undoubted skill of the Italian pilots they simply could not get round the corners. Those who were watching them at the sharp turn off Cowes said that their cornering was the most alarming thing they had ever seen.

One of them trying to take the corner on a normal banked turn, as our pilots did, staggered part of the way round the turn on the verge of spinning all the time. Then he gave it up as a bad job and had to straighten out into a dive from which he recovered only just in time to pull the machine up over Old Castle Point and steer it for Ryde.

Apparently much the same thing happened at the South-

Mr. A. S. Wilkinson and Mr. H. P. Folland.

Proved Reliability!

THE greatest formation flight ever carried out was achieved by four Royal Air Force Supermarine "Southampton" flying boats, each fitted with two NAPIER engines, which flew from England to Australia, round Australia and back to Singapore—180,800 engine miles without mechanical trouble.

THE first non-stop flight from England to India was carried out by a Royal Air Force Fairey monoplane fitted with NAPIER engine—4,130 miles in 50 hours 38 mins.

These flights were carried out with production engines — the same as purchased by our clients.

NAPIER

The finest aero engine in the World

WHAT CANADA USES.—A Fairchild monoplane (Wright Whirlwind)—from the U.S.A.

sea turning point, when the machine created something like a panic by diving at the roof of a house in Southsea and missing it with little enough to spare.

The fact seems to be that the designer has got the side-areas of the machines hopelessly wrong. They are lumpy about the nose, which, when the machine begins to yaw out in turning, gives the nose a hold on the air so that the rear of the machine tries to spin round it.

They are too short in the fuselage for the size of the nose, and that deprives the pilot of his rudder control.

Besides that they have as much fin below the fuselage as they have above it. Consequently when they start a turn and begin to slide outwards the lower fin takes hold of the air and gives the machine a tendency to fall over itself towards the outside of the turn.

When you consider that as soon as the machine begins to slide out on the turn the side pressure on the floats and on this lower fin all tend to roll the machine over towards the outside of the turn, you then see why the very high fin and rudder of the Supermarine steadies the machine on the turn and gives our pilots the power to turn on a perfectly clean bank, as they do.

This defect in the controls probably accounts for the typical Italian turn about which our pilots have had so much argument. The Italians, finding that they cannot get round a turn on a normal bank, as our people do, fly straight at the turn, shove the nose of the machine up with the elevators, as if they were starting a loop, then throw it over on the left wing-tip, and dive back onto the course, in the way which during the War 1914-18 was called an Immelmann turn. They did it quite successfully at Venice, and the Macchi 52 did it quite well over the Solent. But the new Macchi 67s seem to be so bad on their controls that they will not even take their corners properly in that way.

The Proposed Record Attempts.

This known lack of control when cornering probably accounts for the declared intention of the Italians to go for speed records over a straight course. And if they cut down the weight and size of their floats in the way which Lieut.-Col. Bernasconi advocated in the statement attributed to him last week, quite possibly they may get back the speed record. That is all the more reason why we should now settle down to work steadily to get business all over the World on the strength of the advertisement which we have already got out of winning the Schneider Trophy and the accompanying records.

Even if our friends in Italy do get that speed record we can at any rate claim that we beat them fairly and squarely in the Schneider Trophy Contest by producing for that contest aircraft which were thoroughly air-worthy, which could take their corners as aeroplanes should, which would stand the battering of getting onto and off sea-water and not merely the glassy surface of a lake, which stood the requisite six hours of mooring-out afterwards, and which, thereafter, added some forty miles an hour to the existing World's Record for Absolute Speed.

But the question is whether the British Aircraft Industry will set out here and now to get the business which is waiting, or whether it will sit and bask in its reflected glory while somebody else gets the business.

How to Get Business.

There are several ways of getting the World's business in aircraft. The best of all would be a co-operative effort on the part of the whole British Aircraft Industry, in which each firm would contribute so much to the expenses of a World tour by a collection of British aircraft of all types,—a kind of travelling circus of British aeroplanes and pilots.

Each firm would send with that circus one aeroplane, plus spares, of the type which its Directors thought would be the most saleable. Each firm would also send a pilot and a salesman. The circus would visit every country where there was any possibility of selling aircraft, and each machine would have an absolutely fair chance of selling on its merits.

Such a scheme seems so obvious and so simple that neglect of it seems sheer imbecility. Unfortunately it is not workable, simply because the commercial community in this country happens to be predominantly Anglo-Saxon, and the Anglo-Saxon is temperamentally an individualist.

The Curse of the Country.

Co-operation never has succeeded in England. Even agricultural co-operative societies are a hopeless failure in this country. Such co-operative societies succeed in Ireland because the Irishman, being a Mediterranean, is by nature a conspirator and a co-operative society is a conspiracy against the local shopkeepers. Co-operation succeeds in Germany because the Germans, as the word implies, are by nature a brotherhood (*vide* the word germane, and the Spanish word *hermanos*). But the Saxon will not combine.

Several attempts have been made to organise a co-operative circus of this kind even on quite a small scale by co-operation between three or four firms. One has discussed the question individually with a number of quite important

WHAT CANADA USES.—The Fairchild monoplanes (Whirlwinds and Wasps)—from the U.S.A.

people in the Aircraft Industry, and to put the matter bluntly and brutally, they do not trust one another enough to make such co-operation possible. This individualism and mutual mistrust is the curse of English trade in all lines of business.

Several years ago Captain Gerald Deane, who knows the South American nations, or at any rate the aeronautical part of them, better than any other man in this country, proposed just such a scheme as this, and had to give it up as a bad job.

There are others who think as he did, as is shown by a letter from a reader in Canada. This letter is published because it shows quite clearly how we lose our opportunities, and how we ourselves are to blame for losing business.

A Canadian View.

"Sir,—I am an irregular reader of several British, Canadian and American aeronautical publications, and am now writing with reference to an answer to your criticism of the action of a Canadian firm in purchasing a number of American amphibian aircraft, which appeared in *Aero Digest* for July. I did not see your own editorial on the subject.

"Perhaps the company in question might have done better by purchasing British aircraft, but what proof had they that any particular British aircraft would prove suitable to Canadian conditions? They had seen the Sikorsky prove its suitability.

"British aircraft constructors can never hope to dominate the Canadian trade unless they demonstrate the suitability of their products in practical tests and under Canadian conditions.

"Every month a full-page advertisement of a well-known British aero-engine appears in *Canadian Aviation*. On another page a similar advertisement of an American engine of practically the same class appears. The American engine continues to be used exclusively, even though the British engine may be superior to its American rival.

"The American engine has been demonstrated, found satisfactory, and has come into use. The British engine has never been used commercially in Canada.

"Practically every 'plane used for transport work in Canada is American. Even our own R.C.A.F. is using a considerable number of American aeroplanes and engines for forest fire suppression. The man or boy on the street only knows the name of American aircraft.

"In the light 'plane field, however, the situation is exactly the reverse. Here British Moths and Avians hold complete sway. Both types have proven their worth in the Air Force for training and forest fire detection, and in civil life as training 'planes and as light commercial 'planes. The British designers have shown here their ingenuity.

"The Americans are in a better position geographically, it is admitted. In Britain, however, labour is not so expensive, and by adopting quicker and less costly method of construction they could overcome the disadvantage o position. Why then, do the British companies not mak a really serious bid to dominate the Canadian air transpor field?

"I would suggest that the British constructors shoul form a sort of travelling aircraft show. This show woul tour Canada and demonstrate British aircraft products t both the aircraft operators and to the general public, an provide both young and old with interesting literature o all the exhibits.

"I would also suggest that these 'planes give demonstra tions to operators on the northern lakes. Such a tou would be sure to attract widespread attention, and if som of the 'planes broke a few records for air travel (i.e. Winni peg to Vancouver in less than ten hours) then all the mor publicity would be theirs.

What Canada Wants.

"The following, in my opinion, are the characteristic necessary for a successful aeroplane in Canada:—

"1. The engines should be of either radial or in-line typ and should be air-cooled. Several sizes of engines should b developed, having as large a degree of standardisation o parts as possible (i.e. Armstrong-Siddeley series).

"2. The aeroplanes themselves should be of the cabin type and in sizes ranging from four to ten passengers They should be single-motored except in mountainous dis tricts, where a medium-sized tri-motor type would fin favour.

"3. Provision should be made so that the pilot is enclose for Winter flying, and open for Summer use.

"4. The landing gear should be interchangeable from wheels to floats or skis. Flying-boats are only useful i Summer. An amphibian which could be fitted with re tractable skis would be useful.

"5. The fuselage of the 'plane should be of welded steel Its outer skin should be of fabric or of metal. Plywood i unsuitable on snow in Winter and for seaplane work i Summer.

"6. The aeroplane must be able to take off and land in a very small space, as pilots often have occasion to land i small lakes surrounded by trees.

"7. Folding wings are useful, especially in cases where machines have to be taken through heavy city traffic i transporting them from a landing field to a seaplane base to change to floats.

"8. To compete with aircraft now in use the 'planes should have a top speed of 140 m.p.h.

"In conclusion I would say that the aircraft constructors in Britain should not delay in beginning their active campaign in this country, because the companies now estab-

lished are spending large sums of money on repair equipment, and in a short time it will be too late to try to sell them equipment for which they have not proper facilities for repairing. (Signed) "VOX A CANADA."

ANOTHER WAY TO TRADE.

That letter is not published in any hopes that it will help to produce co-operation in the British Aircraft Industry, because, as already explained, such co-operation is a psychological impossibility. It is merely published to show what might be done. Also it is published in support of the next part of this argument.

Let us grant freely that co-operation is impossible. What then is the next way to go for business? Obviously it is for each individual firm to start out in competition with all the other firms to give possible buyers of aeroplanes the kind of aeroplanes they want, at a price they can pay.

That letter shows that there is at any rate a demand for one type of aeroplane, and that is a type which is not produced in this country, namely, an aeroplane with a comfortable cabin and a reasonably high performance.

The Americans make it and we do not. The American market, for the present anyhow, is rapidly becoming saturated and the American manufacturers will soon be starting to sell their surplus machines in our Dominions Overseas,—just as they sold their motor-cars. And, though this paper has been hammering at the British Aircraft Industry for two or three years to make what the market wants, we are still not making it.

AN UNANSWERED CHALLENGE.

A few weeks ago Mr. C. D. Barnard brought down on himself the wrath of certain exalted personages in the British Aircraft Industry for saying publicly that he had bought an antiquated Fokker monoplane for the Duchess of Bedford to fly to India and back because there was not a machine in this country to do the job. His statement was supported with full argument in this paper.

Mr. Handley Page, the new Chairman of the Society of British Aircraft Constructors, was challenged by THE AEROPLANE to support with argument the unsupported assertion which he issued to the Press in contradiction of Mr. Barnard's statement. And he has, so far, failed to give an account of the faith that is in him.

These pages are still open to Mr. Handley Page's reply whenever he cares to produce it. But one cannot imagine how he is going to convince the World that there is in England an aeroplane for that particular job. And the aeroplane for that job just happens to be the aeroplane for which there is a market in the British Dominions to-day, as is quite clearly shown by that letter from Canada.

IN THE RIGHT DIRECTION.

Certainly we are moving in the right direction. Mr. J. D. Siddeley, with that commercial foresight which has placed him to-day in control of the biggest organisation for the production of aircraft and engines in the British Empire, recently acquired the rights for the British Empire for the construction of aircraft to Fokker designs. At the Aero Show at Olympia we saw what a very beautiful job can be made of these purely commercial aircraft.

So far the Siddeley organisation is concerning itself chiefly with the production of triple-engined machines. But no doubt it is equally well able to produce a single-engined machine of similar design.

The De Havilland Co., having produced that interesting experiment the Hawk-Moth, with a 200 h.p. Vee-type air-cooled engine, is now producing the first of a batch of similar machines with radial engines of something over 200 h.p. These are distinctly steps in the right direction,—but by now we ought, as a nation, to be well along down the street with such a proposition, and should not be, at this date, merely making preliminary hesitating steps.

Also the De Havilland Co. are now flying experimentally a very interesting high-wing monoplane with a kind of cabin top. This is a still further step in progress, because this is a type of machine which has not yet been fully tried out either for pleasure or for commercial work. It is in fact a kind of intermediate stage between the big Fokkers and the little Widgeons. It has much to recommend it, and it might well be developed into a high-speed touring craft.

THE CRAZE FOR MULTIPLICITY.

In spite of the fashion, one might almost call it a craze, in this country, for multiple-engined aeroplanes, the case against the single-engined machine is by no means proven.

A single engine running well within its power is certainly more reliable than three engines running almost up to full power. Statistics of accidents all over the World show that the majority of fatal accidents are caused by errors of pilotage, and such errors are not decreased by a multitude of engines.

Accidents due to breakages in the aeroplane itself or to fire in the air or to crashes in bad weather or to landing on bad ground are not decreased in multiple-engined machines,—in fact the fire risk is probably increased.

Also, big multiple-engined machines must always cost more than single-engined machines of medium size. And for normal air service for a good many years to come, cer-

PROOFS THAT CIRRUS ENGINES ARE

THE WORLD'S MOST RELIABLE LIGHT AERO ENGINES.

¶ The great majority of Light Aircraft of British manufacture are fitted with CIRRUS or CIRRUS HERMES engines.

¶ There are more different types of Light Aircraft of Foreign manufacture fitted with Cirrus engines than with any other power unit.

¶ Cirrus engined aircraft won the King's Cup in 1926 and 1927 and the Siddeley Trophy in 1928 and 1929.

¶ Cirrus engines are in use by the British Royal Air Force and are standardised by National Flying Services Ltd.

¶ Cirrus engines are now fitted in over 40 different types of British and Foreign Aircraft.

¶ Cirrus Hermes engines are now fitted in 19 different types of British and Foreign Aircraft.

¶ The record of Cirrus engines in World Flights, International Competitions, Racing, and in every other activity in which Light Aircraft are employed cannot be approached by any other type of British or Foreign low powered engine.

CIRRUS SUPREMACY IS FOUNDED UPON CIRRUS PERFORMANCE.

CIRRUS AERO ENGINES LTD,
Regent House,
Telephone: Holborn 4076. 89, KINGSWAY, LONDON, W.C.2. Telegrams: "Ocirruso, London."

Digitized by Google

tainly for air-taxi services, and even for air-line work, there will be more regular employment for machines carrying four or six or eight passengers than there is for machines carrying twenty or thirty or fifty passengers.

If a British firm were ready to-day to supply single-engined four-seaters and six-seaters and eight-seaters to the British Dominions at reasonable prices, and furthermore if they were ready to back those machines up with a proper service system which could suply spare parts and assure quick repairs on the spot, that firm would be able to do business with such machines for the next four or five years.

If no British firm is ready within the next twelve months to supply such machines, then Australia and New Zealand and South Africa and Central Africa and West Africa and East Africa and India will start buying American machines instead of English machines. And, remember, the old excuse of the Motor Trade that we cannot compete against American mass-production, will not work. American aircraft are not mass-produced. They are built economically by men who are far more highly paid than our men are.

Our Reputation.

As our Canadian correspondent admits, we have got the market for light aeroplanes practically all over the World. Those light aeroplanes have built up a magnificent reputation for British workmanship, British design and British material. And our Schneider victory has increased our reputation.

If our manufacturers have the sense to get to work now and will supply bigger aeroplanes of equal quality, with a better performance in proportion to the power used, at a more reasonable price, then there will be plenty of work in British aircraft factories for many years to come.

Anybody with any mechanical sense and a little foresight can easily think out dozens of ways of improving, or even revolutionising altogether, existing designs of aeroplanes, but if we want work in the British factories the best policy at the moment is to sell what the market wants and then offer them improved types later on, instead of waiting and waiting for better and better aeroplanes and letting our friends in America capture the markets.

One offers these suggestions to the British Aircraft Industry as a general line of policy for getting to work in the quickest and most profitable way. There are many other phases of this question and these will be discussed in succeeding issues of this paper.—C. G. G.

AN ANONYMOUS ENTHUSIAST.

Sir,—It is with a certain amount of trepidation with which I take up my unpractised pen to write to you.

This is my first letter to a paper (or magazine) of The Aeroplane's type—or any other for that matter.

It is with reference to your repeated paragraphs (which so often appear in your personal articles) cursing the average man for not becoming air-minded—cursing the air clubs for not encouraging the average man to become air-minded and generally bemoaning the fact that one does not go out and break one's blasted neck for the honour and glory of British Aeroplane Manufacturers. All of which in theory is right. [But that one did not do so.—C. G. G.]

But take my case—I flew in the War (the more recent tribal dispute) R.E.8s, etc., and cultivated several tastes—two of which I cannot afford now, whisky, which matters least, and flying, which I literally yearn for. God knows I, and thousands like me, in normal health (I am A.1), light-handed, and of an age of discretion, *want* to fly, badly, but if you are running a wife, a house and an Austin Seven on about £500 a year it doesn't give you much hope does it?

It is not only the cost of lessons, but the incidental expenses which always occur when one joins a club of any description, particularly if one is of a temperamental nature and not a teetotaller. So I spend my time in making model aeroplanes which won't fly, reading your delightful articles, and trying to keep up to date as far as I possibly can for the next skirmish—but I suppose I'll be too old for the job then.

You needn't take any notice of this letter,—only realise that there are crowds of fellows who would only too willingly hazard the air and throng the club shows,—but simply cannot afford it.

Flying (civil) is still the well-to-do's game (whoever they are). The rich to-day are usually of the war-profiteer type and as a rule they are afraid to drive their own damned cars.

Good Luck to your top-hole paper and do go on writing those vitriolic articles of yours. (Signed) Thirty-Five.

[As a rule anonymous letters are ignored, but 35 (Squadron or age?) voices the views of so many good sportsmen that his moan deserves a hearing. What about joining the Auxiliary Air Force? Or is the nearest squadron too far away even for the Austin? This letter suggests that we could well do with some more squadrons of the A.A.F.—there seems to be no difficulty about manning and officering them.—C. G. G.]

AN AFRICAN ADVENTURE.

An official communiqué from National Flying Services Ltd. announces that "The Chairman, Captain the Right Honourable F. E. Guest," is proposing to leave this country on October 5, accompanied by Mr. E. H. Fielden and Mr. E. J. Hordern and Miss Winifred Spooner, to open an office at Nairobi, capital of Kenya Colony, and to inaugurate an air taxi service between the various centres of population in that part of Africa.

Those who are interested in National Flying Services, either financially or sentimentally, and who remember that the chief reason for the formation of the company was its grandiose scheme for the opening of aerodromes all over Great Britain, and for the formation of a system of linked clubs and service stations and landing grounds, may be a little surprised to find this firm launching out into the comparative wilds of Africa before it has achieved anything tangible in this country beyond the somewhat luxurious furnishing of an extra-suburban mansion and the laying-out of an aerodrome round it.

Such persons might reasonably have expected the aforesaid mansion to have been linked up with a number of provincial aerodromes near the chief industrial centres of England, from which the firm might reasonably expect to draw customers to its mansion, and so might begin to earn something towards paying a dividend on its capital, or towards relieving the subsidy which the firm draws from the taxpayer, before expending its energy abroad.

So far as one can recollect, nothing was said in the prospectus about activities overseas. The prospectus rather stressed the idea that the firm's reason for existence was the development of aviation within the British Isles,—hence the title National, instead of Imperial or International.

To avoid any misconception on this point the communiqué from N.F.S. says, "It will be remembered that prior to the formation of the company the Chairman, Captain the Right Honourable F. E. Guest, foreshadowed the possibility that this organisation might ultimately provide feeders or branch lines for the main Imperial air routes. This possibility has now been given concrete shape by the decision to open an aeroplane service covering certain districts in East Africa."

Possibly this side-line, as it were, may be a venture quite apart from the firm's main operations and may be separately financed. But if it is not, one questions whether the directors are justified in their action. The subsidy was granted to N.F.S. distinctly on the understanding that it was for the development of aviation in Great Britain. We may grant that it is a subsidy which is paid solely on results, but one cannot help feeling that any diffusion of energy is bound to diminish the amount of work done in this country, and must so diminish the value received by the Nation for the subsidy.

Nevertheless, if N.F.S. is resolved to extend its activities all over the British Empire the directors are undoubtedly wise in starting in an area where a great deal of pioneering work has already been done by other people. Capt. Gladstone, and the Blackburn organisation known as the North Sea Aerial and General Transport Co. Ltd., spent a great deal of time and money in converting the authorities of the Sudan, Kenya, Uganda and Tanganyika to a belief in aviation. Mr. Tymms, of the Air Ministry, has visited the country and has interviewed the chief political people. Sir Alan Cobham has also worked strenuously in that area. Various flights by formations of the R.A.F. and of the South African Air Force have been made over the area. Quite a considerable amount of air taxi work has already been done in that area by individual owners of light aeroplanes. A recently registered firm known as Wilson Air Lines, which one gathers is financed by a Mrs. Wilson, is about to begin operations there, with Flt. Lt. Swoffer, late of the Hampshire Club, as Chief Pilot and Manager. Also, Imperial Airways Ltd. have their plans well advanced for the running of the main Imperial airway to South Africa through that area, with Colonel Sir Helperus Van Ryneveld in charge at the southern end.

Thus undoubtedly there are great possibilities for the development of such services as N.F.S. intend to operate, and the directors have displayed commercial shrewdness in taking advantage of such well-prepared ground.

A FLYING YACHT.

The Dornier company is building a flying yacht to the order of Mr. Garfield Wood, the builder of speed-boats.

The new machine, to be known as the Do-Car, will have accommodation for twenty-four passengers and will be driven by four 500-600 h.p. engines.

It will have an after deck 18 ft. long and 8 ft. wide, a forward deck 10 ft. long and 8 ft. wide. These decks will be for use when the air-yacht is on the water. The yacht will have four staterooms, frigidaire equipment, wireless, shower baths, h. and c., usual offices, a top speed of 140 m.p.h. and a cruising speed of 120 m.p.h.—so it should be within easy reach of any railway station, 'bus and tube. In other words, an ideal residence for a wealthy business man.

"Bristol"

MILITARY & CIVIL AIRCRAFT CONSTRUCTION.

For more than ten years the Bristol Aeroplane Company have pursued a policy of diligent research and experiment in the matter of metal aircraft construction. The result of this work is displayed in the "Bristol" Bulldog and other "Bristol" types. High tensile steel is used for all load carrying members of the structure, and the method of manufacture and assembly of the built up high tensile steel strip units is such that lightness, strength and rigidity are obtained, together with the utmost simplicity and ease of maintenance and repair.

MOTH SEAPLANE

ANOTHER FORE
THE MOTH FOR

Moths are already used for training in the
British Royal Air Force, Royal Australian Air Force, Royal Canadian Air Force, South African Air Force, Irish Free State Army Air Corps, New Zealand Ministry of Defence, United States of America Army and Navy, Chilian Military Air Force, Italian Royal Air Force, Danish Royal Air Force and Naval Air Service, Jugo-Slavian Naval Air Service.

By the Governments of
India, Sarawak, Sweden, Finland, Japan, Greece etc.

At the majority of Schools in
Great Britain, Australia, Canada, India, South Africa, Kenya, Sweden, Singapore, Switzerland, Spain, New Zealand, Finland, Colombia, etc.

For Private or Commercial Flying in all the above Countries and
France, Germany, Belgium, Portugal, Poland, Argentina, Brazil, Straits Settlements, Nigeria, Tanganyika, The Bahamas, Rhodesia, New Guinea, Peru etc.

OR PORTUGAL

POWER ADOPTS
NING PURPOSES*

FURTHER EVIDENCE OF MOTH ROBUSTNESS

A deputation of Portuguese Officials in examining the merits of various aircraft have finally chosen a complement of Gipsy Moth Seaplanes for the Portuguese Naval Air Force. These are to be used for training and instruction purposes in **aerobatics.**

Portugal's decision once again endorses the claims of Moth robustness and reliability, for aerobatics demand machines not only of unquestionably high performance, but also of structural strength to withstand abnormal stresses. Portugal's name is thus added to the long list of Dominion and Foreign Powers who have selected the Moth for training their Service Pilots.

Blackburn
LINCOCK

200 H.P. LINCOCK SINGLE-SEATER FIGHTER

"One is glad to have another opportunity of emphasising the Lincock's performance, for it is miles an hour faster than any single-seater which is at present issued to squadrons of the R.A.F. ... It did everything that has ever been done at an R.A.F. Pageant by a single-seater. Its vertical upward rolls were quite remarkable and its slow horizontal rolls showed that it is good to handle." *The Aeroplane April 3 1929.*

THE WORLD'S SPEED RECORD.

The World's Speed Record over a straight line course of three kilometres (one mile seven furlongs) was broken twice at Calshot on Sept. 10 by the High Speed Flight, R.A.F.

The conditions which govern this record, which is in Class C.a of those decreed by the *Fédération Aéronautique Internationale*, rule that the aircraft must pass the starting line in horizontal flight and must not enter the course by diving. The course has to be covered twice in each direction in one flight, and the speed of the four runs recorded. The average of these four runs is the official speed. If more than four flights are made, the best speed on four consecutive runs (two in each direction) are taken.

No height greater than 400 metres (1,312ft.) may be reached throughout the flight. The pilot must not be at more than 400 metres (1,312ft.) for a distance of 500 metres (half a kilometre, or roughly 550 yards) before entering the speed course.

The measured course for this trial was between Calshot Spit and Agwi Pier. The timing was recorded by the new automatic speed-course timing apparatus, which has been devised by the Royal Aircraft Establishment at Farnborough. This apparatus has been approved by the *Fédération Aéronautique Internationale* for timing speed records.

It consists of a special camera at each end of the course with a connecting submarine cable. Each camera is provided with two magnetically operated counters, each of which is connected electrically with the corresponding counter on the other camera. The two circuits thus formed are interrupted alternately by contacts on either side of one prong of a tuning fork, and by this means the counters are operated alternately every one-twentieth of a second. Images of the counters are projected on the film, and in this way the passage of the aeroplane across the sighting post is recorded on some ten or fifteen consecutive photographs, beside each of which is the photograph of two counters.

The tuning fork, which is electrically maintained, is started well before the first run. A stop-watch is automatically started when the counters are set in operation, so that a check can be made on the period of the fork.

The method of deducing the time for each run consists of plotting the distance of the aeroplane from the centre of the film in each picture—a mean line being drawn through the points. The readings of the counters at the time when the aeroplane crosses the sighting post is thus found, and by subtracting the initial readings of the counters when at rest before the run the number of vibrations made by the fork from the start of the counters is found.

The records from both cameras are treated in this way and, by further subtraction, the time for each run is found. By this method the time can be determined to one-fiftieth second, giving the speed with an accuracy of 0.3 m.p.h. at 300 m.p.h.

The weather conditions in the early morning at Calshot were not good, and at 10.00 hours, when the Gloster-Napier VI was towed out on a pontoon, there was still a considerable amount of mist over the water, and quite a thick haze over Southampton. Although the air cleared in the evening, it was very far from satisfactory during the trials.

Flt. Lt. Stainforth took the Gloster off at 10.45 hours after a run of only 12½ seconds on the surface. Six minutes later he entered the speed course. After the third run over the course he took an extra turn, having apparently found some difficulty in getting an accurate check on the starting line. He flew over the course five times before alighting. The last four were recorded, and his speeds were: Second 351.3 m.p.h.; Third, 328.3 m.p.h.; Fourth, 336.2 m.p.h.; Fifth, 329.3 m.p.h.—Average, 336.3 m.p.h.

The second attempt was made by Sq. Ldr. Orlebar in the Supermarine Rolls-Royce S.6, which won the Schneider Trophy on Sept. 7, but fitted with a new engine. Sq. Ldr. Orlebar took off at 12.20 hours, after two attempts to unstick, and entered the course at 12.26 hours. Visibility was no better than when Flt. Lt. Stainforth went up, although the wind had shifted slightly. Sq. Ldr. Orlebar had to circle round between every run over the course to get his bearings, and after the fourth run he alighted. Mr. Atcherley, who had been up in two successive Flycatchers during the trials to act as mark buoy, giving them the altitude, alighted alongside the S.6.

Sq. Ldr. Orlebar's speeds were: First, 368.8 m.p.h.; Second, 345.3 m.p.h.; Third, 365.5 m.p.h.; Fourth, 343.7 m.p.h.—Average, 355.8 m.p.h.

Air Ministry officials and representatives of the manufacturers concerned expressed themselves unsatisfied with the results of these trials. She was taken into her shed, and a new airscrew fitted.

On Sept. 11 no flying by the members of the High Speed Flight was allowed by the Medical Officer in charge of the Unit. This order coincided with the Government lunch to the Teams in London, so no time was lost, and if the weather had broken up the Government and the Doctor would have had to share the blame. The Team themselves probably thought that a few hours flipping round the Solent at 350 odd m.p.h. was far less trying than accepting the Government's hospitality, with the consequent liability to speech-making.

On Sept. 12, a final attack was made on the Speed Record. The haze lifted at about 16.00 hours, and Sq. Ldr. Orlebar took the Supermarine Rolls-Royce S.6 up. He dispensed with the pontoon, and taxied the machine straight off the slipway. She unstuck in about 40 seconds in a dead calm.

Sq. Ldr. Orlebar made six runs over the course. The speeds recorded were: Second, 354.6 m.p.h.; Third, 358.7 m.p.h.; Fourth, 353.5 m.p.h.; and Fifth, 365.1 m.p.h. The average speed was 357.7 m.p.h., an improvement of nearly two miles an hour over his speed on Sept. 10.

After the Supermarine had alighted Flt. Lt. Stainforth took the Gloster-Napier VI up, but after a short trial he alighted again, some small defect having developed in the engine.—C. M. MCA.

A GOVERNMENT ENTERTAINMENT.

The members of the British and Italian Schneider Trophy teams were the guests of the British Government at a lunch at the Ritz Hotel on Sept. 11. The Secretary of State for Air, Lord Thomson, was in the Chair. The other guests included senior officers of the R.A.F., members of the Italian Legation and the designers of the seaplanes and engines.

EXPERT APPRECIATION.—Some of the personnel of Calshot with their families and certain aeronautical correspondents of the Press watching Sq. Ldr. Orlebar flying at 345 m.p.h. at Calshot in the Supermarine-Rolls-Royce S.6 at Calshot on September 10. —(*"Aeroplane" photograph.*)

THE WINNING AIRSCREW.—Two views of the Fairey metal airscrew which was fitted on the Supermarine-Rolls-Royce S.6 which won the Schneider Trophy Contest and the World's Speed Record.

The following is believed to be a fairly accurate condensation of what was said after lunch,—albeit second-hand:—

Proposing the health of the teams, LORD THOMSON said that he was glad to welcome General Balbo who had worked with such inexhaustible energy, and Mr. Henry Royce who had designed the winning engine and Mr. Mitchell who had designed the winning aeroplane.

Referring to the Italian team he said that they were regarded here as great pilots and very gallant gentlemen.

In congratulating our own team, Orlebar and his officers, he was congratulating the Royal Air Force, of whose system of training and administration they were products. The staff of the Air Ministry had been largely responsible for the organisation. We were proud of the British champions and grateful to them. They had done what was expected of them and a great deal was expected of all the R.A.F.

To mark the Nation's sense of pride and gratitude His Majesty the King had authorised him (Lord Thomson) to announce that he intended to confer the Air Force Cross on Flying Officer Waghorn.

He believed that the members of this year's team had flown for the last time in the Schneider Trophy Contest. This year's pilots would be succeeded by others.

Three factors counted in this race, men, machines, and money. The amount of money required from the taxpayers gave us furiously to think.

Speaking as one who for the time being represented flying in this country in its political aspect he wished well of our Italian Guests and hoped that we might always meet equally good and generous sportsmen.

GENERAL BALBO, through an interpreter, thanked Lord Thomson. He was not very happy at the results that Italy had attained. They had not come to win the Schneider Trophy but for good fellowship. In their hearts they said to the British Team, "Till next time."

COLONEL BERNASCONI said that his team had come to England to fulfil a promise. Unhappily the machines and engines had not been quite ready. Sq. Ldr. Orlebar had broken the record which Italy had held for three years and in the true spirit of sportsmanship he felt that Italy should try to take the honour from him as soon as possible.

SQUADRON LEADER ORLEBAR said that Mr. Royce and Mr. Mitchell and the technical staff of the Air Ministry, by their splendid work with the team at Calshot, had made themselves members of the Team. The firms and the Air Ministry could be compared to the back in a Rugby team,—they had looked after the team, protected them and showed them the way to go. Then they had the forwards, the mechanics of the Flight and the mechanics from the various works, who, out of the limelight, had pulled their weight in a most wonderful way. Then there were the pilots who might be called the three-quarters who had the brilliant runs. Waghorn had scored a most colossal try and Atcherley and Greig had done the same thing. They had run right through and scored. The team had been as much a team as, and even more than, a fifteen in a Rugby match.

They had all felt greatly privileged to have taken part in such an event and they thanked their Italian rivals for the wonderful show they had put up in spite of their difficulties and the loss of their great Captain Motta. They had done marvels and the way in which they had faced their difficulties had been wonderful.

RUMOURS FROM ROME.

Reports from Rome state that Warrant Off. Dal Molin and Serjt. Agello are making preparations to test the Piaggio seaplane with the intention of obtaining the World's Speed Record.

The Piaggio was a non-starter for the Schneider Trophy and is alleged to have no floats. The wings are said to support the machine on the water, and apparently only the front airscrew of the tandem engines can work when it is on the water. The rear screw seems then to be in the water, so the machine has to take off with the front engine only.

Rumour also states that a Macchi 67 is being got ready to attack the record, a special wing which is hoped to add 10 m.p.h. to the speed of the machine is to be fitted. Presumably the new wing will be smaller than the original, so that the landing speed will also be put up.

THE ROYAL AERONAUTICAL SOCIETY.

The following congratulatory telegrams have been sent by the Royal Aeronautical Society:—

To the Supermarine Aviation Works:—

All members join in sending your Chief Designer (Mr. Mitchell) and all concerned with the production of the S.6 that performed so brilliantly and victoriously to-day, extremely cordial congratulations.—SEMPILL, President Royal Aeronautical Society.

To Brig.-Gen. the Rt. Hon. Lord Thomson, Minister of Air:—

May I offer through you to the Royal Air Force High Speed Flight as a whole, and to Flying Officer Waghorn in particular, the Royal Aeronautical Society's profound congratulations.—SEMPILL, President.

To Mr. Royce, of Rolls-Royce, Ltd.:—

All members of the Royal Aeronautical Society join together in paying tribute to your outstanding genius, which, with the collaboration of your assistants and workmen in Rolls-Royce has resulted in the production in record time of your remarkable new type engine.—SEMPILL, President.

A DEEP DEPRESSION OVER CALSHOT.—Flt. Lt. Stainforth, with Mr. H. P. Folland, in light suit, Mr. J. S. Buchanan (left), and (between Flt. Lt. Stainforth and Mr. Folland) Mr. A. G. Forsyth, registering disappointment after the attempt on the World's Speed Record by the Gloster-Napier VI at Calshot on September 10.

THE ROYAL AIR FORCE.

The London Gazette.

September 10.

ROYAL AIR FORCE.

GENERAL DUTIES BRANCH.—The following are granted S.S. comns. as Plt. Offs. on probation with effect from and with seniority of Aug. 30:—K. M. Cass, H. R. Clay, L. A. Cubitt, G. G. Dixon, G. D. W. Prayling, D. W. H. Heath, R. J. B. Hitchin-Kemp, H. de M. Middleton, R. J. Parkhouse, A. C. Richardson, J. B. Tatnall, H. Travis.

Lt. J. B. Heath, R.N., is reattached to the R.A.F. as a Flg. Off. with effect from Aug. 20, and with seniority of June 16, 1924.

The following are granted perm. comns. in the ranks stated:—FLT. LT.—R. Y. Eccles (May 1). FLT. LT.—F. Boston (Sept. 1). FLG. OFFS.—H. R. Bardon, C. A. Bell, H. A. Evans-Evans, T. P. P. F. Fagan, J. D. Greaves, J. A. Hawkings, W. T. Holmes, L. T. Pankhurst, T. H. Perry-Keene, F. C. Rowland, A. C. H. Sharp (Sept. 1).

The following are promoted with effect from Sept. 11:—FLIGHT LIEUTENANTS TO BE SQUADRON LEADERS.—L. G. Le B. Croke, P. Warburton, M.B.E., R. P. M. Whitham, M.C.

FLG. OFFS. TO BE FLT. LTS.—R. W. E. Bryant, J. J. Nolan, M. D. Ommanney, C. F. Steventon, C. R. Hancock, C. H. Tighe, F. W. Moxham.

The following Plt. Offs. are promoted to the rank of Flg. Off.:—K. F. T. Pickles (June 17); P. G. J. Atkinson (July 9); A. C. Pearson (July 9).

Sq. Ldr. P. C. Sherren, M.C., is placed on the half pay list, Scale B, Sept. 3 to Nov. 2, 1929, inclusive. Flg. Off. E. J. Wright is placed on the retired list on account of ill-health (Sept. 7); Flg. Off. E. G. Olson is transferred to the Reserve, Class C (Sept. 4). The S.S. comns. of the following Plt. Offs. on Probation are terminated on cessation of duty:—P. F. Corbett (Sept. 7); J. E. Ashworth (Sept. 11); A. A. McLaren (Sept. 11). Flg. Off. V. S. Bazalgette (Lt., King's Own Royal Regiment) relinquishes his temp. comn. on return to Army duty (Sept. 1).

CHAPLAINS BRANCH.—The Rev. A. H. Dolphin, A.K.C., relinquishes his S.S. comn. on completion of service (Sept. 6).

RESERVE OF AIR FORCE OFFICERS.

GENERAL DUTIES BRANCH.—The following Plt. Offs. on probation are confirmed in rank (Mar. 18):—N. A. Lindley, A. A. Worth.

Flg. Off. V. P. Field relinquishes his comn. on completion of service (Sept. 7); Plt. Off. on probation F. E. S. Groves relinquishes his comn. in the Special Reserve on account of ill-health (Sept. 4).

The comns. of the following Plt. Offs. on probation are terminated on cessation of duty:—D. S. Clarke (Aug. 10); R. A. Robbins (Aug. 23).

AUXILIARY AIR FORCE.

GENERAL DUTIES BRANCH.—No. 601 (COUNTY OF LONDON) (BOMBER) SQUADRON.—The following Plt. Off. to be Flg. Off. (Jan. 26):—T. J. R. Cornewall-Walker.

Appointments.

Week ending Sept. 16.

GENERAL DUTIES BRANCH.—Wing Commanders R. J. F. Barton, O.B.E., to No. 1 F.T.S., Netheravon, to Command, 31/8. J. T. Babington, D.S.O., to Air Ministry (C.A.S.), for Air Staff duties, 31/8. Sir C. J. Q. Brand, K.B.E., D.S.O., M.C., D.F.C., to R.A.F. Depot, Middle East, for Engineer duties, 9/8. P. Babington, M.C., A.F.C., to H.Q., R.A.F., Middle East, for Personnel Staff duties, 30/8.

Squadron Leaders F. H. M. Maynard, A.F.C., to No. 12 (B) Sqdn., Andover, 1/9. W. R. Cox, M.C., A.F.C., to No. 504 (B) Sqdn., Nottingham, 19/8. R. S. Sugden, A.F.C., to No. 501 (B) Sqdn., Filton, 26/8.

Flight Lieutenants A. J. Elliott, to R.A.F. Depot, Uxbridge, 1/9. I. M. Rodney, to H.Q., A.D.G.B., Uxbridge, 14/9. H. G. Sawyer, A.F.C., to R.A.F. College, Cranwell, 4/7. N. H. D'Aeth, to No. 204 (F.B.) Sqdn., Cattewater, 31/8. H. R. F. Baxter, to A.G. School, Eastchurch, 2/9. R. Duncanson, to No. 35 (B) Sqdn., Bircham Newton, 16/8. T. S. Ivens, to H.Q., Wessex Bombing Area, Andover, 22/9. W. E. Theak, to No. 13 (A.C.) Sqdn., Andover, 31/8. E. J. L. Hope, A.F.C., to No. 17 (F) Sqdn., Upavon, 1/9. M. H. Ely, to R.A.F. Base, Calshot, 16/9. H. M. Mellor, to R.A.F. Depot, Uxbridge, 26/8. H. M. Groves, to No. 27 (B) Sqdn., India, 2/8. M. E. B. P. Storrie, to No. 14 (B) Sqdn., Palestine, 14/8. W. E. Knowlden, to No. 26 (A.C.) Sqdn., Catterick, 2/9. J. Cottle, M.B.E., D.F.C., to No. 2 A.C.C., Palestine, 3/9. A. R. Jones and A. E. Lindon, M.B.E., to H.Q., R.A.F., Middle East, 3/9. W. J. Millen, to No. 26 (A.C.) Sqdn., Catterick, 2/9. E. B. Grenfell, A.F.C., to No. 99 Sqdn., Upper Heyford, 12/9. C. D. Pyne, to No. 33 (B) Sqdn., Netheravon, 16/9. H. Thomas, to No. 1 F.T.S., Netheravon, 11/9. H. G. Kirkman, to School of Photography, S. Farnborough, 25/8. R. L. Ragg, A.F.C., and G. H. Smith, to R.A.F. Base, Calshot, 24/9.

Flying Officers H. A. Evans-Evans, to H.Q., R.A.F., Middle East, 3/9. H. H. Brookes, to No. 2 A.C.C., Palestine, 3/9. N. K. Howard, to R.A.F. Depot, Uxbridge, 10/8. M. H. Clare, to No. 404 Flight, Mediterranean, 30/7. N. B. Morris, to No. 2 A.C.C., Palestine, 3/9. M. Lowe, to No. 4 F.T.S., Middle East, 31/8. T. F. Molony, to E. and W. School, Cranwell, 9/9. E. G. C. Stokes, to E. and W. School, Cranwell, 9/9. E. V. S. Lacey, to Station H.Q., Kenley, 12/8. C. R. Mason, to Night Flying Flight, Biggin Hill, 12/8. R. G. Hart, M.C., to School of Photography, S. Farnborough, 14/9. W. M. C. Kennedy, to C.F.S., Wittering, 12/9. J. F. Moir, to No. 2 F.T.S., Digby, 24/8. J. Clarke, to R.A.F. College, Cranwell, 4/9. S. R. Groom, to Andover Communication Flight, 17/8. J. H. Woodin, to R.A.F. Base, Calshot, 22/9. P. G. Lucas, to R.A.F. Depot, Uxbridge, 1/9. W. T. Holmes, to Station H.Q., North Weald, 2/9. T. P. P. F. Fagan, to Station H.Q., Cattewater, 2/9. J. G. Franks, to A. and G.S., Eastchurch, 2/9. H. H. V. Tristem, to No. 5 F.T.S., Sealand, 22/9. H. W. Pearson-Rogers, to No. 24 (C) Sqdn., Northolt, 4/9. J. C. C. Slater, to A. and G. School, Eastchurch, 26/8. N. S. Allinson, to A. and G. School, Eastchurch, 2/9. H. J. G. E. Proud, to A. and G. School, Eastchurch, 24/8.

Pilot Officers F. K. Wood, to School of Naval Co-operation, Lee-on-Solent, 16/8. O. W. Hoffman, to R.A.F. Depot, Uxbridge, 15/7. P. S. Hession, to R.A.F. Depot, Uxbridge, 8/7. F. L. P. Henzell, to No. 8 (B) Sqdn., Aden, 30/8. R. Chadwick, to R.A.F. Base, Calshot, 24/9. The undermentioned Pilot Officers are posted to the R.A.F. Depot, Uxbridge, on appointment to S.S. Comns. on probation, with effect from 30/8:—K. M. Cass, H. R. Clay, L. A. Cubitt, G. G. Dixon, G. D. W. Frayling, D. W. H. Heath, J. B. Hitchen-Kemp, H. de M. Middleton, R. J. Parkhouse, A. C. Richardson, J. B. Tatnall, H. Travis.

MEDICAL BRANCH.—Squadron Leaders J. Rothwell, M.B., to No. 23 Group H.Q., Grantham, 16/9. K. Biggs, M.C., D.P.H., to R.A.F. Depot, Uxbridge, 26/9. R. E. Bell, M.B., to H.Q., Inland Area, Stanmore, 20/9.

Flight Lieutenant J. Magner, M.B., to Aircraft Park, India, 5/8.

STORES BRANCH.—Flight Lieutenants E. W. Lawrence, to No. 47 (B) Sqdn., Middle East, 21/8. E. R. Wood, to No. 4 Stores Depot, Ruislip, 10/9.

Flying Officer J. E. Reynolds, to No. 35 (B) Sqdn., Bircham Newton, 27/8.

ACCOUNTANT BRANCH.—Squadron Leader J. S. Griffiths, to R.A.F. Training Base, Leuchars, 9/9.

Flight Lieutenant E. C. MacK. Knott, to H.Q., Inland Area, Stanmore, 16/9.

Flying Officer R. J. Wishlade, to No. 111 (F) Sqdn., Hornchurch, 2/9.

CHAPLAINS BRANCH.—The Rev. J. A. Jagoe, M.A., to H.Q., R.A.F., Cranwell, 1/9.

The New Air Member for Personnel.

The Air Ministry announces that the following appointment will take effect from Jan. 1, 1930:—

Air Vice-Marshal Tom Ince Webb-Bowen, C.B., C.M.G., to be a Member of the Air Council (Air Member for Personnel) in succession to Air Chief Marshal Sir John Maitland Salmond, K.C.B., C.M.G., C.V.O., D.S.O., on the latter taking up his appointment as Chief of the Air Staff.

Air Vice-Marshal Webb-Bowen was born in 1879, and after passing through Sandhurst was gazetted to the Bedfordshire Regiment. He served with his regiment in India in 1902. He learned to fly on a Farman biplane at Brooklands, and his Royal Aero Club certificate No. 242 is dated July 2, 1912.

He transferred to the Royal Flying Corps shortly after its formation in 1912, and when Major Fulton inaugurated the Aeronautical Inspection Department at Farnborough Capt. Webb-Bowen, as he was then, was put in charge of the workshops at the Central Flying School.

He went to France with the R.F.C. in 1914 and early in 1915 he took over the command of No. 2 Squadron from Major C. J. Burke. In June 1915 he was promoted Lieutenant Colonel.

In February 1916 he took over command of II Brigade from Major-General J. M. Salmond, who had been called home to reorganise flying training in England.

In 1917, when General Plumer took an Army to Italy, to restore the front after the defeat at Caporetto, he asked for and obtained the appointment of Brig.-Gen. Webb-Bowen to command his air force. Brig.-Gen. Webb-Bowen was promoted Brevet-Colonel for distinguished service on that front. He was also awarded the Military Order of Savoy. He was mentioned in Sir Douglas Haig's Despatch on Jan. 4, 1917.

His foreign decorations also include the Légion d'Honneur (France), the Croix de Guerre (Belgium), the Order of Leopold (Belgium), and the Order of St. Anne (Russia).

He was appointed to be a Companion of St. Michael and St. George in the New Year Honours of 1918 and made a Companion of the Bath in the New Year Honours of 1919.

In August 1919 he was appointed to a permanent commission in the R.A.F. with the rank of Air Commodore. In January 1920 he was appointed Air Officer Commanding, R.A.F., India. In April 1923 he was restored to the Home Establishment to command No. 3 Group, Spittlegate, and in 1924 he was appointed to command the Inland Area, R.A.F.

He was promoted Air Vice-Marshal in July 1925 and in November 1926 he was appointed to command the R.A.F. Middle East.

A Fatal Accident.

The Air Ministry regrets to announce that, as a result of an accident at Upavon, Wiltshire, to a Siskin machine of No. 17 (Fighter) Squadron, Upavon, on Sept. 10, Plt.-Off. Lawrence Errington Jeff Lucas, the pilot and sole occupant of the aircraft, was killed.

The Cattewater Station.

An Air Ministry Order states that on and after Oct. 1, 1929, the R.A.F. Station, Cattewater, will be known as the R.A.F. Station, Mount Batten.

The postal address will be Mount Batten, Plymouth, Devon.

The Trooping Season.

The R.A.F. Transport *Nevasa* will sail from Southampton on Oct. 8, and will reach Port Said on Oct. 18; Suez Oct. 19; Port Sudan Oct. 21; Aden Oct. 23; Basrah Oct. 29. Leaving Basrah on Nov. 2, she will arrive at Karachi on Nov. 6; Aden Nov. 15; Port Sudan Nov. 17; Suez Nov. 19; Port Said Nov. 20; Southampton Nov. 30.

Special Assessments.

The following officer and airmen have been awarded special assessments as shown on completion of a course of *ab initio* flying training at No. 1 Flying Training School:—

Distinguished Pass:—Plt. Off. R. A. Benyon; 363131 Sjt. S. Lugg; 355528 Cpl. J. C. Sowden; 363973 L-AC. C. A. Groves; 364083 L-AC. G. F. Harcourt-Powell.

Notations have been made accordingly in the official records.

Fleet Observers.

A Fleet Order states that a few vacancies still remain to be filled in the next course for officers to qualify as Naval Observers in the Fleet Air Arm. The course begins at the Signal School on Oct. 28. The names of any additional officers who desire to be considered for selection for this course are to be forwarded without delay through the usual channels.

Long Service and Good Conduct.

The Long Service and Good Conduct Medal has been awarded to the following airmen. The award in each case is with effect from the date in brackets:—

188 S.M.1 Copper, E. E. (29.4.29); 246 S.M.1 Baker, C. W. (28.3.29); 654 S.M.1 Hanson, T. A. (17.10.28); 215 S.M.1 Kerr, J. H. (11.8.28); 186747 S.M.1 Linn, G.A. (25.3.29); 314114 S.M.2 Billing, W. C. (23.3.29); 313241 S.M.2 Scott, J. J. A. (21.12.28); 1344 F-S. Cockram, S. W. (5.7.26); 180 F-S. Holder, A. F. J. (21.4.29); 313221 F-S. Raverty, G. R. M. (23.7.20); 86 F-S. Williams, M. (5.11.24); 314934 F-S. Wooltorton, G. E. H. (10.1.29); 336076 Sjt. Bowerman, H. H. (3.10.27); 163052 Sjt. Crowley, J. J. (22.10.28); 340921 Sjt. Dennett, J. R. (4.12.26); 65843 Sjt. Fletcher, W., M.M. (21.2.29); 341741 Sjt. Jump, W. (5.1.28); 314859 Cpl. (A/Sjt.) Bowdidge, E. E. (1.1.29); 354305 L-AC. Chester, C. H. (19.4.29); 136895 L-AC. Geal, F. (6.2.29).

The Royal United Service Institution.

The following is the programme of lectures to be delivered at the Royal United Service Institution during the winter:—

Oct. 9.—"Progress in Civil Aviation," by Air Vice-Marshal Sir Sefton Brancker. Chairman, Brigadier-General Lord Thomson.

Oct. 22.—"Co-ordination of Imperial Defence," by Major W. Elliot, M.P. Chairman, Admiral Sir George P. W. Hope.

Oct. 30.—"Australia's Part in Naval Defence," by Captain H. J. Feakes, R.A.N. Chairman, Major-General Sir Granville Ryrie.

Nov. 20.—"Modern Military Bridging," by Colonel A. Brough. Chairman, Major-General P. G. Grant.

Dec. 11.—"The Situation in the Middle East," by Sir E. Denison Ross. Chairman, Major-General Sir Percy Cox.

Dec. 18.—"Tactical Concentration," by Rear-Admiral C. V. Usborne. Chairman, Admiral Sir Roger Keyes.

Jan. 8.—"The Functions of the Territorial Army," by Colonel P. L. Hanbury. Chairman, Lieutenant-General Sir Reginald B. Stephens.

Jan. 22.—"The Strategical Mobility of Air Forces," by Group Capt. C. L. Courtney, R.A.F. Chairman, Air Vice-Marshal Sir John F. A. Higgins.

Feb. 5.—"Recent Economic Developments in the Dominions and Colonies," by Sir Halford Mackinder. Chairman, Field-Marshal Sir Claud W. Jacob.

Feb. 19.—"The Navy in the Persian Gulf," by Captain R. St. P. Parry. Chairman, Vice-Admiral B. S. Thesiger.

Feb. 26.—"Developments in Army Organisation," by Lieutenant-Colonel P. G. Scarlett. Chairman, Major-General C. Bonham-Carter.

Mar. 5.—"Air Co-operation with Mechanised Forces," by Wing Commander T. L. Leigh-Mallory, R.A.F. Chairman, Lieutenant-General Sir A. A. Montgomery-Massingberd.

Mar. 19.—"The Chemistry of War," by Dr. F. A. Freeth.

The lectures all begin at 15.00 hours.

Hard Lying Concessions.

An Air Ministry Order states that as from April 1, 1928, an allowance at the rate of 10s. a quarter is issuable to airmen during the period in which they are present with their units on H.M. Aircraft Carriers, to cover the cost of washing the following articles of public clothing and bedding which are not washed at public expense:—Overalls, hammocks, bed-covers and blankets.

Entitlement is to be based on naval ration strengths and the allowance is to be paid quarterly in arrear. For periods of less than 90 days, the allowance is issuable at the rate of 1⅓rd pence a day calculated to the nearest penny.

ARMY CO-OPERATION.—Men of the Army Co-operation Flight of No. 3 Squadron, Royal Australian Air Force, signalling by Radio Telephony and ground strips to aircraft in the air. In the background are four of the Westland Wapitis which are the new equipment of the Squadron.

SLOTTED WAPITIS IN AUSTRALIA.—The equipment of "A" (Army Co-operation) Flight, No. 3 Squadron, Royal Australian Air Force, on the Squadron's Aerodrome at Richmond, New South Wales. The Squadron's crest can be seen on the fuselage of the nearest machine.

The R.A.F. Swimming Championships.

The fourth annual championship meeting of the R.A.F. Swimming Association was held at St. George's Baths, London, on Sept. 13. The importance of swimming in the R.A.F. can hardly be overestimated. Apart from its obvious value as a form of exercise, the history of the Service contains numbers of incidents in which the lives of personnel have been saved by good swimmers going to the rescue of disabled and sinking aircraft

The officials of the R.A.F. Swimming Association who give so much of their time to the sport deserve the gratitude of the authorities, as well as of their fellow-sportsmen. That the championship meeting was so poorly attended by those officers of the R.A.F. who could so easily have been there was not the fault of the officials of the Association, but a regrettable lapse on the part of the aforesaid officers.

Among those who were present at this year's meeting were Air Marshal Sir John Higgins and Lady Higgins, Air Vice-Marshal Sir John Steel, Group Capt. L. W. B. Rees, V.C., Wing Cdr. R. J. Mounsey, and Mrs. Mounsey.

Wing Cdr. Mounsey refereed the water polo, and Mrs. Mounsey presented the prizes, Flt. Lt. H. Norrington acted as starter. The judges were Flt. Lts. Howell, Harrison, and Patterson, and the timekeepers were Flt. Lt. Wakeford and Plt. Off. Roth. The whips were S-M. Harrison, Flt. Sjt. Snelling, and Flt. Sjt. Holmes and the excellent announcer was S-M. Trowbridge.

A small R.A.F. string band made heroic efforts to play between blasts of Flt. Lt. Norrington's whistle. Some of the competing Units, notably Uxbridge, were strongly supported by airmen and their friends.

Three new R.A.F. records were put up. In the final of the 220 yards championships, L-AC. Henderson beat his own record by 3 1/5 seconds, a notable achievement. In the final of the 100 yards championship, AC. Robertson, of Manston, beat the R.A.F. record put up by the late Flt. Off. W. H. O. Rumfitt (who was killed in a flying accident at Leuchars in October, 1927), by 3/5 sec. In the plunging championship, Flt. Lt. Smylie, of Halton, beat the record put up by Sjt. J. B. McGinn last year by 8½ inches.

The final of the Inter-Unit Water Polo Championship was between Manston and Digby, and resulted in a draw of 4 goals all, after extra time had been played. Manston had one man out of the water most of the time with cramp. Both sides had a man out of the water most of the time, not necessarily for fouling, but for unlawful offences.

Three London swimming clubs took part in the Invitation Relay Race of two lengths, which was won by the Penguins, a Croydon Club. An exhibition of swimming was given by three members of the Hammersmith Ladies' Swimming Club, who performed sundry novel feats which were warmly applauded.

The results were:—

440 *Yards Championship.*—(1) AC. Reeves (Manston), (2) Sjt. McGinn (Digby). Time, 7 min. 5 sec.

100 *Yards Back Stroke Championship.*—(1) Plt. Off. Brackenbury, (2) AC. Greenwood. Time, 1 min. 23 4/5 sec.

220 *Yards Championship.*—(1) L-AC. Henderson, (2) AA. Godwin. Time, 2 min. 57 1/5 sec.

100 *Yards Breast Stroke Championship.*—(1) AA. Bradshaw (Halton), (2) L-AC. Nicholls (Henlow). Time, 1 min. 24 4/5 sec.

Diving Championship.—(1) AA. Feask (Halton), (2) AC. Richards (Uxbridge), (3) AC. Willmott (Felixstowe).

OPERTA APERTA (The Motto of No. 3 Squadron, R.A.A.F.).—The Commanding Officer, Sq. Ldr. Lucas, and Officers of No. 3 Squadron, Royal Australian Air Force. Third from the right (seated) is Flt. Lt. C. T. Anderson, on exchange from the R.A.F., and commanding the Army Co-operation Flight, and second from the left, Flt. Lt. James Moir who, with Flg. Off. Owen, flew from Australia to Greece and later from England to Australia.

Digitized by Google

Plunging Championship.—(1) Flt. Lt. Smylie, 60 ft. 5½ in., (2) Wing Cdr. Mounsey (Henlow), 58 ft. 7½ in.

100 *Yards Championship.*—(1) AC. Robertson (Manston), (2) AC. Brown (Wittering). Time, 66 1/5 sec.

Inter-Unit Relay Race, 240 Yards.—(1) Henlow, (2) Digby, (3) Manston. Time, 2 min. 35 1/5 sec.

Inter-Unit Water Polo Championship.—Manston 4, Digby 4.

Once again Cranwell, which has a splendid swimming bath, was not represented in the Inter-Unit Competitions. Undoubtedly the moving of the Electrical and Wireless School to Cranwell will alter this state of affairs in future years.—C. M. MCA.

THE ROYAL AUSTRALIAN AIR FORCE.

The Department of Defence of the Government of the Commonwealth of Australia has recently placed an order with the Bristol Aeroplane Co. Ltd., of England, for eight Bristol Bulldog single-seat Fighters with Bristol Jupiter Mark VI supercharged engines. The Bulldogs are intended for the Royal Australian Air Force at Point Cook, for training purposes.

The original order for twenty-eight Westland Wapitis for the General Purpose Squadrons of the R.A.A.F. has been increased to thirty-one. Of these fourteen have been delivered and the rest are promised for the end of this year. Thirty-two D.H. Moth "air-frames" (that is machines without engines) have been ordered, on tender, from the Larkin Co.

No. 3 Squadron, R.A.A.F., the Unit which is the subject of the photographs accompanying these notes, was inspected by the Governor-General, Lord Stonehaven, and the Minister for Defence, Sir William Glasgow, during its three weeks in camp at Richmond, N.S.W., during July.

This Squadron has recently been re-equipped with Westland Wapitis. Its work includes Army Co-operation, Photography, Wireless, and general-purpose duties. The Commanding Officer is Sq. Ldr. Lucas and the Other Ranks consist mainly of citizen personnel drawn from Sydney.

During the 1929 camp "A" (Army Co-operation) Flight alone completed 270 hours' flying without a single breakage of any kind. This Flight is commanded by Flt. Lt. C. T. Anderson, D.F.C., an officer of the Royal Air Force who is on exchange duty with an officer of the R.A.A.F. Flt. Lt. Anderson transferred to the Royal Flying Corps after serving in France with the 2nd Manchesters in 1917 and was awarded the D.F.C. in 1918. After various appointments on the Home Establishment and in India he was posted to Australia for Army Co-operation duties in 1928.

On the occasion of the annual dinner of the Victorian Section of the Australian Aero Club, held in Melbourne in May, Air Commodore R. Williams, C.B.E., D.S.O., Chief of the Air Staff, Royal Australian Air Force, responding to the toast of the R.A.A.F., made several interesting statements concerning the Air Defence of Australia.

He said that the R.A.A.F.'s primary consideration was, of course, that of defence and the development of civil landing grounds, the provision of workshops and the training of civil pilots and ground engineers, such as is supplied by the various flying clubs or sections of the Aero Club, all helped quite materially towards readiness in case of need.

He also appreciated the helpful co-operation throughout the Commonwealth of the petrol and oil companies—a co-operation of vital importance from a defence point of view.

With regard to the equipment of the R.A.A.F., he said that the R.A.A.F. hoped to get rid of all its S.E.5as, D.H.9s, and Avro 504Ks within six weeks after making his speech. These would be replaced by the Westland Wapiti of which several of the order for 31 had already arrived in Australia, and other modern types.

The Service was hoping for a considerable increase in appropriations during the next financial year. The programme included re-equipping the Flying Training School and two Citizen Air Force squadrons.

It had been decided that the whole of the R.A.A.F. equipment, both Service and training, should be fitted with the automatic slot.

With regard to wireless, he thought it would be interesting for people to know that for the last two years the R.A.A.F. Station at Point Cook had been communicating every day, by short wave, with the British Air Ministry, thus saving a good deal of money that would otherwise have been spent in cablegrams. The same station was now in regular communication with Canada and New Zealand.

While the British Forces were in Shanghai this station had passed many messages on their behalf to England.

They hoped shortly to instal direction-finding apparatus. Provision had been made for all new R.A.A.F. equipment to carry W/T installations.

Good progress had been made during the year with aerial photography, and work had been done for the various State Governments.

The Citizen Air Force had now been running for about three years, but this was the first year in which they had had anything approaching the requisite number of aircraft for a squadron in training. The results they had got at this year's three weeks' camp were very good indeed.

In the matter of aircraft materials, he said that there were two schools of thought. One was for wooden construction, and the other for all-metal. A committee had been formed to inquire into the possibilities of manufacturing aircraft from Australian raw materials, and it hoped to arrive at a definite policy in the near future.

He thought that Australia would be willing to learn from other people. There were lots of brains throughout the world, and not all concentrated in one country. "We should," he concluded, "make use of experience throughout the world; and this was being achieved to some extent by means of a regular exchange of officers between the R.A.A.F. and the R.A.F."

THE ROYAL AUSTRALIAN AIR FORCE.—Lord Stonehaven, Governor-General of Australia, at Richmond, New South Wales, where No. 3 Squadron, R.A.A.F., are stationed. On the left of the group is Sq. Ldr. Lucas, Officer Commanding No. 3 Squadron, and next to him is Flt. Lt. C. T. Anderson. On the right is Flt. Lt. Walters, Adjutant.

THE METAL-CLAD AIRSHIP.

The first product of the Aircraft Development Corporation, Detroit, Mich., which is now a division of the Detroit Aircraft Corporation—the metal-clad airship ZMC-2—has recently made its first test flights with success.

The Metal-clad Airship was designed by Mr. Ralph H. Upson in 1921, and in the following year the Aircraft Development Corporation was formed in Detroit, to develop this ship. Mr. Harold H. Emmons, who had charge of Aircraft Engine production for the U.S. Government during the War 1917-18, was president, Mr. Carl B. Fritsche vice-president and general manager, and Mr. R. H. Upson the chief engineer of the Corporation.

The first four years' operations of the company was confined to experimental work, but in the autumn of 1926 a contract was signed with the U.S. Navy for the building of an experimental airship, and it is this ship which has just made its first test flights.

Mr. Ralph Upson read a paper before the late Institution of Aeronautical Engineers (London) on June 4, 1926, in which he explained the principles which led up to the development and construction of the Metal-clad Airships. A *résumé* was published in THE AEROPLANE for June 16, 1926.

The ZMC-2 is remarkable for a number of novel features the most notable being that it is all made of metal.

The framework of the ship consists of five main transverse circular frames, seven intermediate frames of smaller section whose main function is that of acting as formers, and twenty-four longitudinals, the whole being covered with a skin of Alclad .0095 in. thick.

The longitudinals are of single-rolled channel-section duralumin varying in thickness from .014 to .032 in., and the five main circular frames are built-up in triangular section. The whole framework is stamped out for lightness.

The ship was assembled in two upright halves starting with the end rings at the bow and stern. This operation was illustrated in THE AEROPLANE of Feb. 20, 1929.

As the work of assembly progressed, the sections were hoisted towards the roof of the shed. When both sections were completed they were tilted over to a horizontal position and rivetted together. The work of assembling the framework and rivetting on the covering was done progressively.

The metal covering was cut in strips ranging from 6 ins. to 17¾ ins. wide and shaped to the correct curvature. To join these thin strips a special automatic rivetting-machine was devised.

This machine was set on a carriage running on concentric rails placed directly under each half of the hull. The machine was then adjusted to the proper angle of the hull plating and set in motion. This machine is capable of spacing, inserting, and completing 135 rivets per minute, or about 40,000 rivets in one 8-hour shift. In its operation it gauges the correct and uniform overlap of the plates.

Three strands of wire are fed like thread into the machine and sections, rivet-length, are sheared off, and punched through the two sheets of metal covering. After this a revolving cam heads-up the rivets. After rivetting the seams were treated on the inside with a bitumistic sealing compound.

The metal skin carries the shear stresses and a certain portion of the tensile stresses as well as reinforcing the internal frame members. It thus reduces the quantity and size of internal framing necessary.

Unlike the practice in other all-metal airships, the hull itself of the ZMC-2 acts as the only container for the lifting gas.

There are two ballonets, one forward and the other aft. The two comprise about 25 per cent. of the total hull volume. These ballonets are made of two-ply rubberised fabric and the seams are lapped, cemented and taped, but not sewn. They are inflated with air to regulate the gas pressure.

The control system comprises eight fins placed equidistantly round the hull, thirty feet forward of the stern.

The hull is 145 ft. 5 ins. long and 52 ft. 8 ins. in maximum diameter, giving a fineness ratio of 2.83. By placing the control surfaces well forward of the stern, the designers hope to utilise the smooth flow of air as near as feasible to the point of greatest diameter.

The four nearly vertical fins have four rudders and the four nearly horizontal surfaces are fitted with four elevators. All these surfaces are built up in a manner similar to that employed in the Ford all-metal monoplane.

The control-car is of metal, and like the control surfaces is covered with corrugated duralumin. On each side of the car is mounted one 200 h.p. Wright Whirlwind J-5 air-cooled radial engine driving a tractor airscrew.

Fuel is carried in a 200-gallon container in the rear portion of the car, together with 50-gallon water ballast container.

THE METAL-CLAD AIRSHIP.—The ZMC-2 nearing completion in its shed at Detroit.

Digitized by Google

THE METAL-CLAD AIRSHIP.—The control car and engines.

The ZMC-2 was designed to have a gross lift of 12,242 lbs., of which 3,442 lbs. is useful load, on a helium gas capacity of 202,200 cub. ft.

On its initial flight it carried a useful load of between 2,200 and 2,300 lbs., made up of five men, about 700 lbs. of fuel and oil, 400 lbs. of water, and 140 lbs. of sand, on a helium gas capacity of 180,000 cub. ft.

In the initial flights a speed of 47 m.p.h. was made with the engines running up to 1,200 r.p.m.

Before delivery to the U.S. Navy the ZMC-2 will undergo a number of tests, including a 15 ft. per sec. ascent under power, a 15 ft. per sec. descent under power, descent as a free balloon 1,000 ft. in 4 mins., as well as tests for trim, gas and air tightness, speed and reliability.

[One would like to add a personal note of congratulation to Mr. Ralph Upson and Mr. Carl Fritsche,—two of one's most valued friends in the United States,—on this preliminary success of a completely revolutionary experiment. They have pinned their faith to it for five years, despite the jesting disbelief of many of their friends and the jibes of all their enemies,—and they deserve every success that can come to them.—C. G. G.]

THE FORD TRIMOTOR AT CROYDON.

The Ford All-Metal Monoplane with three 425 h.p. Pratt and Whitney Wasps, which was perhaps the most interesting foreign visitor at the Aero Show, has recently returned to this country after flying about 7,500 miles on the Continent.

On Sept. 10 and 11 the Ford Motor Company arranged for this machine to give demonstration flights at Croydon. On Sept. 10 the Ford Trimotor, as Mr. Bill Stout's creation is called in the States, was to be seen flying pretty low over London. On Sept. 11 one went down to Croydon, and on arriving at Waddon was fortunate enough to meet Mr. Capel, of Cirrus Engines, Ltd., who designed the Cirrus Hermes. He had come to meet someone by the same train who failed to turn up. Mr. Capel gave one a lift up to the Air Port, where the Ford could be seen standing in front of the hotel with the engines lazily ticking-over

There did not seem to be much organisation, and nobody had much to say as to what had been done and what was going to happen. However, hearing that the Director of Civil Aviation was coming down, one waited about and watched the machine giving demonstration flights

One was not told how much fuel there was aboard, and the passengers certainly were not blessed with luggage, so that the Trimotor was not flying fully loaded; nevertheless, in a wind of 8 to 10 m.p.h. she leapt from the ground in about nine seconds and climbed with remarkable agility. The Trimotor appeared to be landing reasonably slowly, but the ease of handling on the ground was the real eye-opener.

The Ford has independent wheel brakes and a tracking tail-wheel. The result was that after landing the machine ran up to the crowd like a car and then swung right round in its own length much more quickly than a large car could have done. Nobody in the crowd bothered to move, because they knew the machine was under control and steerable.

During this part of the proceedings one was able to have a word or two with Mr. Manning, who is the Ford test pilot. He found time to outline roughly the European trip of the Trimotor

The Ford left Croydon and flew to Paris, where she stayed for two or three days giving demonstration flights for the benefit of everybody who mattered. The next step was to Berlin, by way of Cologne. In Berlin the Ford stopped for a week. In spite of the fact that Germany is the home of all-metal construction, the Ford attracted a lot of attention, and raised a lot of enthusiasm.

From Berlin the Ford flew to Moscow by way of Danzig and Riga. For some reason the Ford personnel were allowed all over the Government aircraft factories and saw everything there was to see. The Russians gave them a good time, and one gathers that the Ford crew felt the visit was well worth while.

From Moscow the Ford flew back to Berlin by Smolensk, Riga, Warsaw, and Posen. The next step was to Copenhagen, by Travemünde. At Copenhagen they visited the Rohrbach Works, and at Malmö, whither they next flew, they had a look-see over the Swedish Junkers Works.

Then they came back to Britain by way of Amsterdam and Rotterdam, to Lympne. The Ford flew on to Hamble to see the Contest for the Schneider Trophy, and then returned to Croydon.

By this time those who had flown had drifted away and the others had gone to tea. At this point one noticed Mr. R. R. Rhodes of Blackburns, who was busily engaged in comparing British and American aircraft practice, and seemed to be the only representative of British constructors who had taken the trouble to come and see it fly. In this connection one must again comment on the fact that the Americans display unbounded optimism in not protecting their duralumin either anodically or by means of paint or other protecting surfaces.

The polished Alclad exterior of the Ford still twinkles as brightly as it did at Olympia, but one was able to find traces of corrosion on the fairings of the tailplane bracing struts. One feels that time will prove the necessity of very carefully protecting all the interior structure work of these machines against corrosion.

Sir Sefton Brancker arrived about 16.25 hours, while the Ford people were all away having tea. The Director of Civil Aviation took this opportunity of making a careful study of the machine, and was occupied in doing this when his hosts arrived.

This was the first occasion that the writer had had the opportunity of seeing the American type of inertia starter motor in action. The starting handle is wound round and round quite slowly and about half a dozen times until the flywheel is rotating fast enough to emit quite a high note, a knob on the side of the engine nacelle is then pulled out to let the clutch in, the airscrew turns four or five times, and then the engine starts. On this particular occasion the engines had not been idle for very long, and one would not expect their starting to be difficult.

The inertia starter does, however, appear to offer a very satisfactory method of engine starting, and lacks the complication of extra pipe-lines and distributing mechanism entailed by gas or compressed-air starters.

Fifteen people, including Mr. Manning, the pilot, and Sir Sefton Brancker, who sat beside him, then climbed into the Ford and took off.

The tailwheel, with which this machine is equipped, makes taxying at all speeds with the tail on the ground a very comfortable business, but before one had finished analysing one's impressions on the subject, the machine had left the ground and was high above Croydon.

The Ford is fairly noisy, but the writer did not find it unpleasant, and was quite able to carry on a conversation with Mr. Rhodes, who was his neighbour across the aisle. The only objection to the opening windows is the fact that they let in more noise—there is no excessive draught.

Soon Putney Bridge hove in sight, and then Hammersmith—from the air its Broadway looks quite a pleasant place. From here the course was set by the Great West Road for Hanworth, and the Ford climbed up to 3,000 feet. From this height the pilots—for Mr. Manning and Sir Sefton Brancker were flying the machine between them—put the Ford into a fairly sharp bank and circled down, using the rudder only, with hands off the control column. The Ford apparently can be put into a bank and stays there without any increase of angle. The machine came in quite low over the hangars, and was soon on the ground—where a large number of black and orange Moths could be seen lined up.

The party trooped out of the machine and indulged in various conversations with the Hanworthians who came up to greet the invader. There were about a dozen cars parked at the edge of the field, as the Americans call it, and quite a lot of people in chairs were watching the proceedings.

The Ford soon took off again, and flew over to Heston, finally returning to Croydon, where as a final demonstration of its manœuvrability it was taxied up to the concrete and spun round four times by the simple process of locking one wheel.

As the hour was latening, one remained behind at Hanworth, whence through the kindness of Mr. C. A. Pennington one was transported by car, Col. and Mrs. Pennington very kindly driving one right into town.—T. J.

On Sept. 14 the Ford left for Constantinople through Central Europe. One of the stopping places is Friedrichshafen.

THE LA BAULE RALLYE.

The International Seaplane Meeting, organised by the Aéro Club de France, was held at La Baule, the new and much-advertised seaside resort on the coast of Brittany, on Sept. 14 and 15. The loud-speakers announced that everywhere both to the north and south of La Baule sea mist was still hanging about all day; but the bay itself was happy in that the sun shone, the fog had lifted, and even the visibility was quite good.

Among those present at the meeting were Monsieur Francois Poncet, Under-Secretary of State for Fine-Arts who represented the Government; Admiral Pirot, Prefect Maritime of Brest, representing the French Navy; Marshal Franchet d'Esperey; M. Blériot; M. Flandrin, President of the Aéro Club de France and Vice-President of the Chambre des Députés and others. British Aviation was represented by Air Vice-Marshal Sir Sefton Brancker, and Group Capt. Smyth Piggott, Air Attaché at Paris. M. Laurent Eynac was represented by Admiral Esteva.

There were three prizes for competition:—For the *Rallye Internationale Aérienne*, Frs. 100,000 in kind, and a work of art of value Frs. 10,000; for Speed, a cup awarded by the Aéro Club de France; and for Altitude, the George Dreyfus prize of Frs. 25,000. Saturday's was mainly a military programme; Sunday's was exclusively sporting.

The morning of the first day was devoted to group flying and evolutions over the bay by five C.A.M.S. (Lorraine, 450 h.p.), and two Goliaths. Some very pretty flying was seen, the C.A.M.S. in particular making nice landings in perfect formation. This squadron was put at the disposal of the organising committee by the Naval authorities.

In the afternoon a more spectacular programme had been arranged. Beginning at 2.30 p.m. a quite realistic bombardment and exhibition of aerial warfare took place, the crowd being most interested in the first demonstration in France of a smoke screen, and hugely delighted by the fountains of water thrown up by dropped bombs. "Worse than a whale!" was one sweet young thing's awestricken comment. For the smoke-screen display the weather was almost ideal,

The Vickers-Reid Control Indicator

An essential instrument for flying in conditions of poor visibility.

Captain C. D. Barnard, who in seven days with Her Grace The Duchess of Bedford, recently flew from England to India (Karachi) and back writes :—

"**The Reid Control Indicator was invaluable** - especially considering the fact that a great deal of **the journey was flown in clouds or in dust storms, it worked perfectly** and I should insist upon a 'Reid' being fitted to any machine if I were to contemplate a similar flight on it."

August 17th, 1929.

ROLLS ROYCE

AGAIN CHOSE

FIRTH AERO STEELS

Digitized by Google

THE Rolls-Royce "R" Type Engine which was fitted in the Supermarine Racing Seaplane S.6 on which Flying Officer H. R. D. Waghorn won the Schneider Trophy was equipped with the following Components made from Firth Aero Steels.

Connecting Rods,
Crankcase Bolts,
Cylinder Studs,
Propeller Shaft,
Main Reduction Gears,
Main Reduction Pinions,
Camshaft,
Supercharged Gears,
Pump Drive Shaft,
Valves,
Valve Springs,
***Cowling Fastenings,**
***Combined Fin & Oil Cooler,**
***Y-Couplings to Water System,**
Spar Coupling Hinge Fittings (S. 62 B.).

*** These parts made from Firth Staybrite Steel (D.T.D. 42).**

THOS. FIRTH & SONS, LTD.,
SHEFFIELD.

there being practically no wind at all, and the screen hung about for twenty minutes.

The interval between the aerial warfare display and the arrivals of the entrants in the Rallye Internationale was filled with some good stunting by Detroyat in a Morane-Saulnier, Sadi Lecointe, and others, and by periodic announcements of the varied progress made by Sir Sefton Brancker towards La Baule. Sir Sefton, who was brought by Mr. J. T. Pitt in his luxury flying yacht, the Saro Cutty Sark, came from England, but was delayed very considerably en route by the sea fog which prevailed everywhere except at La Baule. He eventually arrived at 6.30 p.m. and found the tide so low that he had to wade to land.

On Saturday night a dinner was held at the Casino to officials, participants, and the Press. Air Vice-Marshal Brancker, speaking in French, commented on the cordial relations which existed between French and English aviation circles and expressed a wish for them to continue. M. Flandrin announced that M. Blériot had promised to offer a cup value Frs. 100,000, for an international speed competition for landplanes next year. The 1930 spectacle was expected to be on a much larger scale.

On Sunday Detroyat again gave a display. His exhibition was chiefly distinguished by the number of people who hastily sat down when he passed overhead and by two enthusiasts of riper years who fell off their chairs in an effort not to lose sight of him. He made by far the greatest impression on the crowd. But at no time did the enthusiasm of the general public strike one as excessive—not even at his eighty degrees angle of ascent, or his falling leaf, or his flying upsidedown for three miles—unless dropping one's hat off the official tribune into the water is a sign!

Here a thought obtrudes itself; is England really the only country where spontaneous enthusiasm is expressed by loud noises in the throat? Clapping does seem *so* spineless after hearty cheers.

The scene in the afternoon was very picturesque. The tremendous expanse of perfectly flat sea with tiny waves flapping the sand; eleven sea-planes and various yachts, warships, and fishing smacks scattered about; an empty blue sky; and the blood-red Morane-Saulnier rushing to and fro. The gathering storm had conveniently heaped itself, along with the sun, behind one's back. The music which played during the intervals is worthy of mention; it was decidedly above the average for such a show. In this connection one really must congratulate whoever arranged the perfect synchronism of the best music, the loudest planes just overhead and the loud speaker. Maybe it was the man who did,—or rather didn't,—the fireworks!

The entrants in the Rallye had left on a twelve hundred kilometre course at 4.30 a.m. Saturday and arrived back between 5 p.m. and 7 p.m. the same night, and the results were announced early on Sunday. It did not necessarily follow that the first man back was the winner as the points were awarded according to a formula L^2/W, where L was a coefficient of the distance and W the power per passenger—all rather reminiscent of Orly and somewhat complicated.

De Précourt was first on a Schreck amphibian (Hispano-Suiza 180 h.p.), he thus wins Frs. 50,000 and the Cup offered by *Le Journal*. Challe was second on a Schreck (Lorraine). Tanguy third on a Schreck (Hispano 180 h.p.). Ponce, the Air Union pilot, who had seven passengers, was fourth. He was flying a Loiré-Olivier (420 h.p. Gnome-Rhone). Paumier on his Schreck amphibian (Hispano), was fifth.

The Speed Contest was won by Tanguy, who did a hundred kilometres in 55 mins. 54 secs. Paumier, Ponce, and de Précourt arrived in this order; and Challe gave up through engine trouble.

Great interest was shown in the arrival of a miniature land-machine, the Mauboussin, which had just broken four world's records. Two Portuguese Macchi machines were unfortunately stranded en route and after their arrival at Corunna no more news was received of them. Thus the Rallie was robbed of its last chance to be considered international this year by a series of unforeseen happenings.

Monday was devoted to joy-riding the more venturesome of the general public, and already on Sunday there was quite a formidable list of applicants. Altogther quite a jolly week-end and one that brought back very vividly the day of the school sports. Still, "little drops of water...." and surely the babe of two who clapped her hands at "le joli bruit" when Detroyat passed will have her own plane in twenty years.—V. G. W.

AN INTERNATIONAL OCCASION AT ROCHESTER.

At the beginning of this year the French Government decided to allow the use of foreign-built aircraft by the subsidised French Air Lines. Later in the year, as reported in THE AEROPLANE of April 10, the French Government ordered from Short Bros. Ltd. of Rochester a Short Calcutta similar to those used by Imperial Airways on the Mediterranean section of the Indian Air Route.

This latest Calcutta has now been completed and recently left for San Raphael, the Naval Air Station on the Mediterranean. Its route was that flown by our Far East Flight—and by Sir Philip Sassoon in the Blackburn Iris,—namely, down to Bordeaux, and then overland to the Mediterranean.

On Tuesday, Sept. 3, Monsieur de Fleuriau, the French Ambassador, accompanied by Lieut. de Vaisseau A. Sala, the French Assistant Naval Attaché for Air Services, paid a visit to Rochester.

After lunch the Ambassador and his companion went aboard the Calcutta, and when they had completed a tour of inspection, were taken for a flight, together with Mr. Oswald Short and a party of five or six. Besides the pilot, Mr. Lankester Parker, there were three in the crew aboard.

The writer's next-door neighbour on the trip was a newspaper man who had flown all over the Luft Hansa routes and France and has also flown in big airships. His first remarks were on the comfort of the pneumatically upholstered chairs and the feeling of spaciousness.

The Bristol gas-starter got the three Bristol Jupiter IX's going one after the other with no wait at all. The moorings were slipped and the big boat began to swing upstream. Mr. Parker taxied the boat about to warm up the engines, and when he had got into position above the Works turned downstream and opened out. The machine left the water almost immediately and was soon high above the three towns of Strood, Rochester and Chatham.

Owing to the fact that most of the party were smoking (the Calcutta's petrol tanks are in the upper centre-section,

ON THE WATER.—The French Short Calcutta taxying on the Medway after the demonstration flight.
("Aeroplane" photograph.)

so that there is no danger of fire), it soon became necessary to take advantage of the adjustable ventilators in the central duct along the ceiling.

[One ventures to suggest that a leak in a tank in the centre-section, trickling down to struts, might conceivably form gas which might be sucked into the ventilating system of the cabin, with evil effect.—C. G. G.]

One hears so much about the noise problem in big aircraft that one wishes the hundreds of thousands who are compelled to travel twice a day by underground trains could have the opportunity of travelling in a Calcutta. There is no doubt that the result would be a chorus of praise that would result in a terrific burst of airmindedness. The noise is considerably less than that in underground trains at full-blast or in a motor-bus roaring up a hill on bottom gear.

There is no trace of deafness on landing. There appears to be no trace of vibration from the engines, and the view of the enormous steel tube chine-struts seen from the window is guaranteed to stouten the most failing heart.

The view from the seats is good. One can see everything on either side. Only in a forward direction is there no view. Even so the view from such a machine is much more interesting than that from a train, one can see so much farther and there is not that succession of objects flashing past that defeats the eye of the train-traveller.

The Calcutta climbs at the rate of 710 ft. per min. And at this height we travelled along the Medway doing "S" turns, so that Lieut. Sala, who was doing a turn of piloting, could feel what the boat was like on the controls.

After flying over some of the dockyard the Calcutta dropped down on the Medway to give the photographers a chance, and then rapidly regained her lost height. And having flown for half an hour Mr. Parker brought the machine onto the water.

One noticed most vibration when the engines were cut off, for then one seemed to feel the airscrews swinging round. This was all the more noticeable owing to the lack of vibration with the engines on.

Through the porthole one watched the water rushing past and waited for the bump as the boat hit—but it didn't. There was a sudden tearing sound of water rushing along the keel, which rapidly died away, and the boat was back on the water.

The drogues were thrown out and the boat taxied to pick up her moorings, which job of work was done by a member of the crew from the front cockpit, and then the passengers went ashore in the dinghy.—T. J.

A BROBDINGNAGIAN BLACKBURN BOAT.

The Blackburn Aeroplane and Motor Co., Ltd., has submitted designs and tenders to the Air Ministry for the building of a flying boat capable of carrying 50 passengers on a non-stop range of 1,000 miles, to be fitted with six Rolls-Royce "F" type engines.

The intention of the Air Ministry is, so reports say, to use this type of flying boat on certain over-water sections of the England—Australia and England—South Africa air routes

A model of this type of flying-boat was shown on the Blackburn stand at the last Aero Show. In general arrangement it resembles the Nile flying-boat. The six engines will be disposed, four in two tandem pairs and two as tractor engines, one on either side of the tandem engines. The total weight of the boats will be between 30 and 40 tons.

HANDLEY PAGE
AUTOMATIC SLOT CONTROL

"That the slotted wing has been found to be particularly useful in landing in water, is the opinion of the Director of the Provincial Air Service, who contends that a pilot is thus enabled to 'flatten out' ten or more feet above the surface, without resulting damage, in a 'pancake' landing. Among fliers it is generally conceded that unless there is a ripple to serve as a guide, it is practically impossible to judge distance accurately in landing on calm water."

Practical flying at 4d. a mile

QUALIFIED flying members of N.F.S. Clubs may hire aircraft at exceptionally reasonable rates; from 4½d. a mile (£1 10s. an hour), scaling down to as little as 3¼d. a mile (£1 1s an hour). As the hours flown during any one year increase, so the charges decrease proportionately.

N.F.S. flying rates include fuel and oil insurance, and free landing, housing, and handling at any N.F.S. station. The machines are two-seaters, and members are able to carry a passenger at no extra charge. Single-seaters and three-seaters will also be available at a later date.

Hanworth, the London Air Park and Country Club, is now open as the best-equipped private flying centre in the country. In addition to flying activities that include instruction, private flying, and an air taxi service, Hanworth offers social facilities unequalled in the aviation world.

A limited number of members are now being enrolled at the following rates: Flying Members 5 gns. entrance fee, and 5 gns. annual subscription; Non-flying Members, 3 gns. in each case. For 1929, two-thirds of the annual subscription is rebated. Serving Officers of H.M. Regular Forces are admitted without entrance fee. Membership of the Hanworth Club confers honorary membership of all other N.F.S. Clubs. Residential terms at Hanworth range from 5½ to 7 guineas per week.

Write to-day for the N.F.S. brochure that fully describes the privileges of membership and enumerates the services offered to all who wish to fly.

THE LIGHT AEROPLANE AND THE FLYING CLUBS.

MR. BROAD AND THE ZENITH CUP.

The Zenith Cup, like the Schneider Trophy, in no way sembles a drinking vessel. The trouble is that the French ll it *La Coupe Zénith*. Really the cup is a bronze statuette a nude figure holding a palm high above her head.

This cup has been offered, through the generosity of *La ociété du Carburateur Zenith,* under the auspices of the éro Club de France, for the fastest time round a circuit of ance in an aeroplane carrying more than one person.

The circuit is by way of Orly, Tours, Toulouse, Marseilles d Lyon and back to Orly. The distance is 1,044 miles.

On Sept. 16 Mr. Broad, flying the D.H. Gipsy Moth which flew in the King's Cup Race, left Orly at 07.30 hrs. He mpleted the circuit and returned to Orly at 16.44 hrs., an apsed time of 9 hrs. 14 mins. 47 secs. His average speed as therefore 113 m.p.h.

This is considerably better than the best previous time, hich had been put up by Herr Roeder, who flew a Junkers nior, or A.50 with a Walter engine. His average speed as 83 m.p.h.

The cup is open to competition between May 1 and Sept. and in that time anyone is free to enter provided they ive two days' notice. There is yet time for Mr. Broad's ne effort to be beaten.

Mr. Broad was flying the same machine which he flew the race for the King's Cup. This machine was specially treamlined and had a low coupé top. The irreverent called "The Pullover." The Gipsy engine is quite standard. In rder to qualify for the competition, however, an extra seat ad to be fitted.

To comply with this regulation Mr. Broad's faithful comnion, and engineer, Mr. Weedon, was "boarded-in and lled-up, with a slit to breathe through"—as one of the H. people put it. At any rate he was given a livingace which the Factory Act would not approve, and ckily covered in it about the amount of the whole King's up Course in one day.

The time is taken from Orly to Orly, so Mr. Broad merely nded and checked in at three of the enforced stopping laces and re-fuelled only once.

Altogether it was a fine performance by men, machine nd engine, and it is not at all likely to be beaten before he end of the month.

With a little luck the Moth will thus bring to England et another of the few "classic" trophies left to be aptured.

THE BRISTOL AERIAL GARDEN PARTY.

The Bristol and Wessex Club's Aerial Garden Party, which ill be held at the Filton Aerodrome on Sunday, Sept. 22, promises to be a thoroughly enjoyable show. Among other events a competition will be held for the Whiteley Challenge Cup, which can be held for six months. The competition will be either a bombing competition or a balloon-bursting competition, according to the weather. There will also be three other prizes for this event.

Many of those who are going to the Haldon (Teignmouth) meeting on the previous day are going on to Filton, and the organisers are looking forward to a very cheery meeting.

THE LANCASHIRE AERO CLUB AT HOME.

Although the attendance of visiting aircraft was unfortunately small, owing to a clash of dates with the opening of the Leicestershire Aero Club, the Lancashire Aero Club's "At Home" on Sept. 14 was highly successful and enjoyable.

Between two and three hundred members and friends filled the club house and enclosure, and kept the catering department fully employed what time they were not watching the flying or trying their skill at the various side-shows thoughtfully provided.

The flying events included the landing competition for the Pemberton Trophy (won by Mr. Twemlow), a bombing attack on a moving target (won by Mr. Scholes), a balloon-bursting contest (won by Mr. M. A. Lacayo) and an Aerial Treasure Hunt (won by Mr. T. N. Stack).

This last event was a novelty in which pilots were given written instructions by which to follow a course which ultimately led them to a ground signal indicating the buried treasure. On returning to the aerodrome they had to trace out on the judges' map the course followed and the site of the treasure. Not so easy as it sounds, but every competitor except one was successful. Mr. Stack won on time by a short head.

A model aeroplane contest produced some humorous home-made efforts from both juniors and seniors. And a height-judging contest produced some humorous guesses, ranging from 200 to 14,000 ft.

First-class flying displays were given by Mr. T. N. Stack and Mr. Schofield, both of National Flying Services Ltd., and by several R.A.F. pilots, whose anonymity shall be respected, on Avians loaned by the club and by A. V. Roe and Co. Ltd.

Tea and supper were served in the club-house and after the latter event the verandah was cleared and about 50 couples took the floor to the strains of sweet music.

The Committee promises that the event will be repeated and hopes next time to be able to give longer notice to the friends of the club.

THE NEWCASTLE AIR PAGEANT.

The Newcastle Air Pageant, which is being organised by the Newcastle-upon-Tyne Aero Club Ltd. for Oct. 4 and 5, will be one of the most important meetings of the year. The flying on the Friday (Oct. 4) will consist of heats of the races for the Grosvenor Cup, the S.B.A.C. Challenge Cup and the Air League Challenge Cup. In the event of bad weather these heats will be flown on the Saturday morning.

The official programme will start at 14.00 hours on Saturday and will include, in addition to the finals of these races, an hour's show by No. 29 (Fighter) Squadron, R.A.F., exhibition flying by civilian pilots and a parachute drop by Mr. John Tranum. The small airship which has been built in the old balloon-shed near Cramlington will also perhaps attend the Pageant.

The Newcastle Club have mustered a generous supply of prizes in support of the Challenge Cups. The particulars of the Challenge Cup competitions and the prizes to be won are as follows:—

AIR LEAGUE CHALLENGE CUP (HANDICAP) RACE:—

The race is open to Light Aeroplane Clubs and there is no restriction as to the number of competitors entered by each club. The aircraft must be the property of the club entering *or a member of the club.* The pilot must be a member of the club entering. Paid pilot instructors are excluded.

The race is open to aircraft the weight empty of which must not exceed 1,200 lbs. Weight empty means total weight in flying order, the following weights not being included: petrol, oil and crew. The weight of water in the radiators shall count in the weight empty.—Course: 1 lap (total distance 15.85 miles).

First Prize: Challenge Cup presented by Air League of British Empire, and £25. *Second Prize*: £10. *Third Prize*: £5.

THE GROSVENOR CHALLENGE CUP (HANDICAP) RACE:—

The race is open to any type of aeroplane the weight empty of which must not exceed 1,200 lbs. Weight empty means total weight in flying order, the following weights not being included: petrol, oil and crew. The weight of water in the radiators shall count in the weight empty.—Course: 2 laps (total distance 31.7 miles).

First Prize: Challenge Cup presented by the late Lord Edward Grosvenor, and £100 presented by the *Evening World*. *Second Prize*: £15. *Third Prize*: £10.

THE S.B.A.C. CHALLENGE CUP (HANDICAP) RACE:—

This cup will be awarded to the Light Aeroplane Club which enters the aircraft which wins the race. The race is open to all Light Aeroplane Clubs, and there is no restriction as to the number of competitors entered *by each club.* Competing aircraft must be the bone-fide property of, and registered by, the entering club. The pilot must be an *ab initio* pilot trained by the entering club and holding an Air Ministry "A" Licence. No pilot holding a "B" Licence may compete.

The race is open to aircraft, the weight empty of which must not exceed 1,200 lbs. Weight empty means total weight in flying order, the following weights not being included: petrol, oil and crew. The weight of water in the radiators shall count in the weight empty.—Course: 1 lap (total distance 15.85 miles).

First Prize: Challenge Cup presented by the Society of British Aircraft Constructors, and £50. *Second Prize*: £10. *Third Prize*: £5.

The date for receiving entry forms was Sept. 14, but late entries will be received up till noon on Sept. 26 at a fee of five guineas per machine for each of the three races. Late entry fees are not returnable.

Completed forms must be sent to J. Bell, Hon. Sec., Newcastle-upon-Tyne Aero Club Ltd., Cramlington Aerodrome, Northumberland.

Competing aircraft must be at Cramlington Aerodrome for verification by the officials not later than 14.00 hours on Oct. 4. No shed accommodation is available and competitors must be prepared for their machines to be in the open overnight. All picketing gear must be brought with the machines.

THE LONDON AEROPLANE CLUB.

For the month of August the instructors were Major H. G. Travers and Mr. F. R. Matthews. The ground engineers were Messrs. C. Humphreys and A. E. Mitchell. The following machines were in commission:—G-AABL, G-AABN, G-EBZC, G-AAEX, G-EBXS and G-EBWY.

The club was closed down for the first fortnight of August for the staff holidays, but the flying time for the month of August was as follows:—Dual instruction, (134 flights), 65 hrs. 45 mins.; solo flying (159 flights), 66 hrs. 30 mins.; passenger flying (8 flights), 2 hrs. 40 mins.; test flights (53 flights), 9 hrs. 25 mins. Total, (354 flights), 144 hrs. 20 mins.

During the month the following members qualified for their "A" licences:—H. Armstrong, E. H. Allen, Hon. Miss M. K. Leith, R. O. I. Muntz.

THE USES OF PRIVACY.

Country Clubs in the United States have their uses. Col. Charles Lindbergh, wishing to teach his wife to fly, found naturally that at any ordinary flying school he would be so surrounded by camera-men and Press people that he would practically never be able to push his way through them to get to an aeroplane. But the Aviation Country Club, of Hicksville, the opening of which was illustrated in THE AEROPLANE recently, is really exclusive, even for such a democratic country as the United States, so Colonel and Mrs. Lindbergh hied themselves thither, with the result that in six days Mrs. Colonel Lindbergh was able to go solo. Shortly afterwards she and her husband started off to look for the missing Ford tri-motor belonging to Trans-Continental Air Transport, which had piled itself up on a mountain in the Arizona Desert.—Really good work all round.

CANADA—MEXICO NON-STOP.

On Aug. 12 Mr. "Tex" Rankin, in a Great Lakes 2T—1 light biplane (90 h.p. American Cirrus engine), flew non-stop from Vancouver, B.C., to Agua Caliente, Mexico, a distance of 1,350 miles, in 13 hours 8 mins. His engine consumed 75 gallons of petrol of the 100 gallons carried, representing a fuel outlay of $22.50 (£4 10s. approx.).

But why? Vancouver, B.C., is no more dry than Mexico. And *agua caliente* can be got there also.—Apart from that the flight was an extraordinarily fine performance.

THE OPENING OF THE LEICESTERSHIRE AERO CLUB.

THE GIVER OF BLESSINGS.—Mr. Frederick Montague, M.P., Under-Secretary of State for Air, after blessing the Leicestershire Club's Opening, leaves for Town in the official Moth, piloted by Flg. Off. P. P. Grey.
("Aeroplane" photograph.)

The opening of the Leicestershire Aero Club was a thoroughly good show. Hitherto the Northamptonshire Aero Club meetings have always more or less stood out as being friendly and cheery and good fun generally, but Leicestershire looks like running Northampton very close. They seem to have got the right people into the Club, and if only they can collect some of the hunting folk as well it will be one of the best flying organisations in the country.

The present aerodrome at Desford is seven miles out of the City of Leicester, and so is too far away to be much use as a commercial aerodrome. Also it is distinctly on the small side, and there are trees round it, which make it smaller. Consequently, though it is quite good for a Club aerodrome, there is very little chance of its being taken over by National Flying Services, Ltd., in accord with one of the original schemes for the Club, or of its becoming a Municipal Aerodrome.

The initial campaign in favour of forming an Aero Club for Leicester was, according to the excellently produced Programme of the Meeting, launched in the columns of *The Leicester Mercury*, which paper deserves full credit for its good work. The enthusiasts who started the Club invoked the aid of the Aviation Committee of the Leicestershire Chamber of Commerce and its energetic secretary, Mr. Harry Purt. Mr. Lindsay Everard, Member of Parliament for Melton Mowbray Division, consented to become President of the Club.

Whether the Committee of a club can best be formed of practical aviators or of sound business men is a point which can be argued, but, anyhow, the members of the Club chose Mr. Roy C. Winn as Chairman, and Mr. C. Hedley Briggs, M.C., D.F.C., as Vice-Chairman, both officers formerly in the R.A.F. And from what one saw of their work at the opening ceremony, they certainly combine the qualities of business men and practical aviators, for seldom has one seen a meeting better organised or better run.

The Club already has a very neat and comfortable Club House, of the wooden bungalow type, and a wooden shed just big enough for its one Moth. This first Moth was acquired very largely through the generosity and encouragement of the President, Mr. Everard, and it has been named the Quorn—as a compliment, and as an encouragement, to the biggest of the hunts in the vicinity. The Pytchley and the Atherstone are near neighbours, so there are hopes that they may come in, too.

In this connection one remembers that in the very early days of Service Aviation one Captain Burke, of the Royal Irish Regiment, who was one of our first Army aviators, went over to Ireland on leave, and at a dinner party endeavoured to make the local sporting crowd take some interest in flying. He described the joys and risks of flying without drawing much interest, and at the finish one sportsman remarked: "Well, anyhow, it must be grand practice for the huntin',—in the Summer!"

Perhaps the hunting people in the Shires may be induced to take at any rate so much interest. The Club has been fortunate in acquiring Flt. Lt. R. L. Bateman as its instructor and Mr. T. Warren as its ground engineer. Both of them have had a great deal of experience of aviation both in war and as civilians.

The Club certainly drew a goodly attendance of aircraft for its Meeting. There must have been 25 or 30 there when one arrived, rather late, by road, at about 16.00 hours—having been unable to get away from London till about 14.00 hours.

The R.A.F. had kindly lent a flight of Siskins from Grantham to do a demonstration, and there were most of the people whom one is accustomed to see at these meetings, including Flt. Lt. Rose, of the Anglo-American Co., Mr. Ballantyne and Mr. Malcolm, of De Havillands, and Mr. Penrose, of the Westland Company, and Mr. Tapper, of the Automobile Association, who, as usual, made excellent arrangements for parking. Also Miss Spooner, with her

THE OPENING CEREMONY.—Mr. Frederick Montague in middle (with hat) and the organisers of the Leicestershire Club.—*("Aeroplane" photograph.)*

Digitized by Google

small niece, came up from Wokingham, and Miss Slade, from the Heston Air-Park. And, of course, the brothers Linnell came over from Northampton. Whether a meeting is ten miles away or a few hundred miles away, they always seem to go there most sportingly.

One thoroughly good effort was the formation which came from Teignmouth, led by Mr. Parkhouse, and including the Honourable Richard Westenra and Mr. F. S. Lee, of Exeter. The Rev. S. A. Simpson, of Trinity College, Cambridge, was down on the programme as a competitor, but not having the pleasure of knowing him, one cannot vouch for his having been there. Mr. Gordon Selfridge, Junior, also appeared on the programme.

There was a goodly crowd of spectators. Even allowing for the fact that the aerodrome is on the small side, there were so many people all the way round it that there cannot well have been less than 12,000 present. The Club were, perhaps, a trifle ambitious in having a half-guinea enclosure. But there were quite a good few cars in it, even though probably most of them belonged to members. The lower-priced enclosures were packed, and, of course, there were the usual thousands of hedge-guests who would not even pay the lowest price.

The competitions were run in that delightfully sporting garden-party spirit which makes such affairs so much jollier. For example, the winner of the second prize in the Rally did not even know that there was a Rally on. He arrived at the Meeting, saw a Very light, or some sort of signal, landed, and found that he was second. Flt. Lt. Trench in a very smart Avian (Hermes) won first prize.

Likewise, there was a prize for the first woman pilot to arrive. And that was won by Miss Slade, who had no intention of competing. In fact, when she was called to receive the prize, she could not at first be found—as some criminal remarked, she seemed to have been mislaid.

The spirit of the meeting is rather well shown by the comments in the programme under each event. For example, apropos the Rally, there is a note: "We are asked officially to deny the rumour that our Scottish visitors have been hovering over Leicester all night."

There were the usual displays of individual aerobatics.

At 14.15 hours or thereabouts there was a parade of aircraft, with the note on the programme: "We are in a quandary what type of machine to buy next. Can you help us to choose?" That is an excellent reason why makers of aircraft should send representatives to all the Club meetings.

After that our thoroughly sporting Under-Secretary of State for Air, Mr Frederick Montague, who had arrived by air on the new Moth which has been lent to the Department of Civil Aviation by the De Havilland Co., formally opened the Aerodrome.

Thereafter Mr. Tranum, as the programme says, "Calmly steps out into mid-air, drops a thousand feet, then decides to open his parachute. We strongly recommend this quick and easy means of getting down for tea (providing we don't have to do it)."

As a matter of fact, Mr. Tranum was making his first drop with a brand-new type of Russell parachute, so he opened it as soon as he stepped out of the machine at about 2,000 feet. As usual he had timed it exactly, and he came down plumb in the middle of the aerodrome.

The new parachute is the same weight as the old one, and uses exactly the same amount of material, but it is cut differently, so that it is flatter and less cup-shaped, and the rate of descent is very noticeably slower. Mr. Tranum says that it is a great improvement, and he ought to know if anybody does.

PRETTY WORK.—Mr. Penrose showing how neatly and how safely a Widgeon (Cirrus) can be flown.—Mr. Penrose is becoming one of the best pilots of to-day.

There was a balloon-bursting competition, but the balloons were a bit soggy, and kept low, and did not provide at all good sport.

There was a landing competition, in which, as the programme says, "any competitor landing upside down, or failing to land at all, is disqualified." The competitors did not seem very clear whether they had to land on top of a row of flags or to land just over it, or just short of it. Anyhow, Mr. Talbot-Lehmann dropped the tail of his N.F.S. machine right on top of the flags, and was duly declared the winner.

The Siskin formation from Grantham gave a really fine display of formation stunting. And after that there were joy-ride flights till dusk.

One pilot from Grantham made an infernal nuisance of himself by diving continually straight at, and zooming over, the official group when the prizes were being presented. Not only was he a nuisance, but he scared people, and he was definitely flying in a manner which endangered the King's property and the King's subjects. Any error on his part would have killed a lot of people,—and the majority of accidents *are* caused by errors of judgment.

Incidentally, both the management and the crowd deserve complimenting. When the flying was officially declared over, an announcement was made through the loud-speakers

THE NEW TOY.—Mr. Tranum making the first drop in the new type Russell Parachute.—(*"Aeroplane" photograph.*)

Digitized by Google

which were disposed all round the aerodrome that joy-ride flights could be booked at the Club House, and that people could come over for them. Naturally, the crowd proceeded to walk to the Club House straight across the aerodrome. Somebody promptly went to the microphone and told the crowd several times to keep off the aerodrome and come round by the ropes in the interests of their own safety. And the crowd cleared off the aerodrome in a most amazingly obedient way. Either the people of Leicester are unusually intelligent, or else as a nation we really are becoming airminded enough to realise that an aeroplane must have room in which to land.

Altogether, the Leicestershire Club deserve congratulations on their opening Meeting, and one would like to thank Mr. Winn and the Committee for their hospitality and friendliness. The list of those who were responsible for the Meeting deserve to be recorded. They are as follow:

Mr. R. C. Winn, Chairman of Committee; Mr. C. E. Hirst, O/C Flying; Mr. C. Hedley Briggs, Announcer; Mr. N. W. R. Mawle, Ground Officer; Dr. R. Johnston Tait, Ground Medical Officer; Flt. Lt. F. H. Stewart David, Special Duties; Mr. R. C. Johnson, Liaison Officer; Mr. H. A. Browett, Traffic Officer; Mr. J. T. L. Baxter, Traffic Officer; Mr. B. Franklin, Financial Secretary; Mr. K. K. Knight, Ticket Secretary; Flt. Lt. R. L. Bateman, Competitors' Steward; Mr. H. P. Lavender, Fire Officer; Mr. A. E. Coltman, Timekeeper; Mr. E. Clifford Kendall, Timekeeper; Mr. C. A. Peat, Special Duties; Mr. E. A. Goodman, Press Steward; Mr. D. F. Murmann, Special Duties; and Mr. E. A. Underwood, Liaison Officer.

One hopes that the Club will increase and multiply during the Winter, and that it may have many other and even more successful meetings.—C. G. G.

DE HAVILLAND ACTIVITIES.

An interesting addition to the large number of Governments and Air Services who already use Moths for official and training purposes is the Portuguese Naval Air Service. The De Havilland Aircraft Company Ltd. has just received a contract worth about £7,000 for the supply of four Gipsy Moth seaplanes, three spare engines and a large assortment of various gear, spares and other impedimenta.

These Gipsy Moth seaplanes are to be used for instruction in advanced aerobatics and to this end two Portuguese pilots have arrived at the De Havilland School of Flying to take a course in aerobatics with Messrs. Reeve and Pike, chief and second instructors respectively.

An order has also been received for the supply of four Gipsy Moth seaplanes to the Naval Section of the Yugo-Slavian Air Force, for training.

A complete list of Air Forces now using the Gipsy Moth for training purposes is of particular interest:—

The British Royal Air Force, the Royal Australian Air Force, the Royal Canadian Air Force, the South African Air Force, the Irish Free State Army Air Corps, the New Zealand Ministry of Defence, the Chilean Military Air Force, the Italian Royal Air Force, the Royal Danish Flying Corps and Naval Air Service, the Greek Naval Air Service, the United States Army and Navy, the Portuguese Naval Air Service, and the Yugo-Slavian Naval Section.

Service in Germany.

The De Havilland Company is fortunate in possessing a particularly live agent in Germany in the person of Herr Friedrich, who has a very distinguished record in the German Air Force during the War. Now that Moths are being supplied in increasing quantities to Germany, Herr Friedrich has established a full-sized Moth Service Station at the Tempelhof Aerodrome, outside Berlin.

Moth owners can obtain all attendance, petrol and oil, any spare parts which they may require, and repairs are done at short notice. For this purpose an excellent workshop has been set up equipped with the most modern machine tools.

Herr Friedrich is very anxious that all owners of Moths, actual and prospective, should have these facilities brought to their notice,—and would like them to note that a complete new Gipsy Moth is always in stock.

Moths and Cloths.

More and more business houses are realising the saving of time effected by the use of the Moth, and the greatly increased range of personal communication with branches that becomes possible. Two directors of Horne Bros., the multiple clothing emporium, Messrs. Leslie and Cecil Horne, recently learned to fly at The London Aeroplane Club, and both now own Gipsy Moths.

In these they visit their branches in Liverpool, Leeds, Manchester, Wolverhampton, and elsewhere, complete a full day's business, and return the same evening. They are emphatic about the advantages of air travel for their business, and find their Moths invaluable for the journeys for buying, which they constantly make, to nearly all the large manufacturing centres at home and on the Continent.

At week-ends they use their machines for pleasure and they were recently due to leave in them for the Orkney Islands on their holidays, for the shooting and fishing.

The Queensland Aerial Derby.

The Queensland Aerial Derby, just flown, was won by Mr. Leslie Brain, the Chief Pilot of Queensland and Northern Territory Aerial Services Ltd., in a Moth.

Second and third places in a field of 30 competitors also taken by Moths.

A Moth for Sir Philip Sassoon.

Sir Philip Sassoon, President of the Royal Aero Club, has placed an order for a metal Gipsy Moth landplane. This will be specially finished and very fully equipped.

The Moth in Yugo-Slavia.

The Aero Club of Zagreb, Yugo-Slavia, has placed an order for a Gipsy Moth to inaugurate instruction on the Club. This machine is now on its way to Zagreb, flown by Mr. Riley, of the De Havilland School of Flying. There is interest in noting that the De Havilland Agent in Yugo-Slavia is Mr. T. Mapplebeck, late R.F.C.

Misplaced Zeal.

The De Havilland Company recently received a wire from one of its agents to the effect that an important personality in aviation circles in the agent's country would leave that day by air for Croydon and that it would be in the interests of the Company to meet the gentleman concerned. Accordingly, a responsible official of the Company awaited the arrival of the air liner at Croydon and succeeded in meeting at the barrier the gentleman bearing the name given by the agent. Everything went very smoothly and the foreign visitor driven to London in the Company's car.

After having fixed up his new acquaintance with a suitable hotel in London, and having asked him out to dinner, the De Havilland representative asked his new acquaintance what he thought of the Moth. He then made the disturbing discovery that his friend had just made his first trip by air, and was, in fact, a theatrical person on a visit to see a play from his own country done in London.

The wholly unnatural explanation was that the foreign agent, having inspected the air line company's bookings and having seen the name, at once jumped to the conclusion that it was the aviator who was visiting this country. The D.H. firm still have hopes of making the recipient of its hospitality a convert to the Moth.

AVIANS IN THE FAR EAST.

The Far East Aviation Co.—the principal of which is Mr. F. Vaughan Fowler, late R.A.F.—has bought an Avro Avian seaplane (Cirrus Hermes engine) for use in Hong Kong.

This machine, which is due to arrive in the colony in November, will be used for general taxi work, and to enable the company's representative in Hong Kong to get about with speed and comfort. It will carry the registration VR-HAA, the first of a series recently allotted to Hong Kong.

The Hong Kong Flying Club has decided to buy an Avro Avian-Hermes seaplane.

THREE LIGHT AEROPLANE RECORDS.

On Sept. 5 M. Fauvel flying the Mauboussin single-seat cabin monoplane (40 h.p. A.B.C. Scorpion engine) reached a height of 5,300 m. (17,380 ft.).

Thereafter he covered a distance of 700 kms. (434.7 miles) over the circuit Le Bourgêt—Vanciennes—Le Bourgêt beating the previous record for distance covered over a closed circuit by 50 kms. During the course of this flight M. Fauvel beat the speed record over 100 kms. with 140 km.p.h. (86.94 m.p.h.).

All these three performances are—subject to homologation—World's Records for light aircraft weighing less than 200 kgs. (440 lbs.).

The Mauboussin monoplane was described in THE AEROPLANE on Feb. 13, 1929.

THE AERO CLUB OF N.S.W.

The Aero Club of New South Wales is going strong, and the Committee expect a record year. For its third period of twelve months' flying operations the Club has trained 55 pilots to "A" License, with still a fortnight to go, against 28 and 43 the previous years.

The Club has 11 machines—8 Moths, 2 Avians, and 1 Westland, and recently completed 9,000 hours' flying to date. It has a workshop, fully equipped with up-to-date machinery, on its own freehold ground just off the Aerodrome, and does all its own reconditioning and rebuilding, etc., which save a considerable amount of money.

That beats any English club handsomely.

A REPROOF.

The following note has been received:—

re s.s. *Prince of Wales*:—

THE AEROPLANE, current issue, p. 689, para. 2 [foot].

"Packed with *TRIPPERS*."

You've dropped an awful brick this time. Dammit, they were THE HAMPSHIRE AEROPLANE CLUB.

COMMERCIAL AERONAUTICS.

ANOTHER IMPERIAL AIRWAYS DIVIDEND.

The Directors of Imperial Airways announce that the nett profit for the year ended March 31, 1929, after providing £36,175 pounds for obsolescence, amounted to £78,861, —which together with the carry-forward from the previous year of £4,049 leaves available an amount of £82,910.

Out of this amount there has been written off the balance of the preliminary expenses and underwriting commission amounting to £20,663, and £20,000 has been appropriated for additional obsolescence reserve.

The Directors recommend the payment of a dividend of 7½% (seven and one half per cent.) on the Ordinary Share Capital, which will with tax absorb £35,558, leaving to be carried forward to the current year a balance of £6,689.

PROGRESS AT HULL.

Hull has been having a little bother over the site for the new municipal aerodrome. The site had been purchased when the Corporation was informed that the Air Ministry could not license the aerodrome for commercial use on account of the threatened erection of gas-works on an adjoining site.

On Sept. 12 the Corporation decided by 23 votes to 8 to confirm the arrangement made with the East Hull Gas Company whereby the Corporation provided the Company with an alternative site of 20 acres free of cost and purchased the 14 acres previously acquired by the gas company. The total cost to the Corporation is estimated to be about £4,000.

On Oct. 10 H.R.H. Prince George will inaugurate the Hull Empire and Civic Week; he will at the same time open the municipal aerodrome. Prince George will arrive and depart by aeroplane.

Among others who have accepted the City's invitation to be present is the Secretary of State for Air, Lord Thomson.

A fine programme for an Air Display has been arranged. A squadron of R.A.F. Fighters will be the principal attraction. Many well-known civilian aviators have promised to attend. There is to be a race for light aeroplanes over a thirty-mile course and a special display is to be given by an N.F.S. formation. (National Flying Services Ltd. are leasing the aerodrome from the Corporation.)

The Committee extend an invitation to all civil aviators, who will be the guests of the Corporation. The Lord and Lady Mayoress are arranging a ball for the visitors.

Further information may be had from the Hon. Secretary, Aerial Pageant, *Evening News*, Hull.

THE INDIAN AIR MAIL DISASTER.

The following letter deserves consideration:—

Sir,—In the many Press references to this disaster the "Holt Landing Light," or as it is sometimes called "wing-tip flare," is stated to be the cause of the fire.

Without in any way desiring to minimise the terrible nature of this accident and still less to attempt to anticipate the result of the inquiry, I would like with your permission to give the record of this device.

A powerful light of some sort to illuminate the ground must be carried on machines at night in case of forced landings away from an aerodrome. When I submitted the Landing Light to the Flying Corps in 1914 it was regarded with grave suspicion. Not till 12 months later was I even allowed to try it on a machine. As the result of this scepticism, there is probably no device in use in the Air Force that has been tried and tested so searchingly as this.

By the end of the War my Company had supplied Holt Landing Light equipment for 17,000 machines, every night-flying machine in the British and Allied Armies being equipped with it. At the present time it is in use in practically every country in the world, where any night flying is done (many thousands being in use) and till now I have never heard of any accident being caused by its use, here or abroad. On the other hand there are many instances of pilots and machines being saved by it.

It is difficult to understand why even if the wing-tip caught fire, the fire should have reached the fuselage so quickly, unless as suggested there was a leak of petrol,—a wholly abnormal condition and a deadly peril to any machine by night or day.

I hope I may express my deep sympathy with the relatives of the victims. (Signed) H. S. Holt, Lt.-Col.

[The only possible explanation seems to be that, owing to some defect in fitting, the flare burned back into the wing itself. Possibly a flare kept long in stock might change its chemical characteristics, as gun ammunition does, and might burst instead of burning, and throw burning particles onto the wing. If the wing-tip (and aileron) were burned the machine would necessarily drop on that side, and the petrol-tanks would burst when it crashed. Evidently the fire happened close to the ground, or two of the crew and part of the mails could not have been saved.—C. G. G.]

SALVAGE FROM JASK.

A *Times* report from Karachi states that the postmaster of that city has announced the salvage of certain mails from the City of Jerusalem, which was destroyed by fire at Jask on Sept. 6. These mails will arrive in Karachi by the next air mail. All the mails were originally believed to have been burnt.

THIS AIRSHIP BUSINESS.

There has been a lot of talk in the Press lately about the two British airships, the R.101 and the R.100, which are rumoured to be taking the air shortly.

When all the tests are completed and the airships actually take the air the event will be duly recorded in The Aeroplane.

Meantime, as so much experimental work has to be done to assure safety when the ships come out, and as those responsible for them are going steadily about their jobs without worrying about the pressure of the Press, the dates of their launching are uncertain.—C. G. G.

FRENCH AIRCRAFT FOR ROUMANIA.

A report in *The Times* of Sept. 4 states that the Roumanian Government is negotiating with a French firm for the purchase of 100 new aeroplanes for the Air Force.

THE LONDON TERMINAL AERODROME.

ANALYSIS OF FIGURES FOR PAST WEEK.

Trips per Day.—Sunday, 18; Monday, 33; Tuesday, 32; Wednesday, 37; Thursday, 39; Friday, 37; Saturday, 33.

A CHANCE FOR GOOD MEN.

Two first-class pilots are wanted.

One is for South Africa. He must be an absolutely first-class instructor with full R.A.F. qualifications in present day methods. Also he must have organising ability. Flying Club experience is desirable. The basic salary is £1 per flying hour with extras and a minimum of £30 per month is guaranteed. The pilot will have to agree to remain in South Africa for a year. The salary may seem low but the job can be developed into a very good one.

The other job is for a pilot in the Further East. It involves a good deal of flying over dangerous country. The pilot must have experience of light aeroplanes and of big machines, and for choice should have experience of low-wing monoplanes. The job is worth £900 a year.

Applications should be sent to the Editor of The Aeroplane in such form that they can be forwarded to the employers without transcription.—C. G. G.

RECEIVERSHIP.

Wings Publications Ltd.—R. S. Andrews, C.A., of 448, Strand, W.C.2, was appointed Receiver on Sept. 2, under powers contained in debentures dated Mar. 21 and May 1, 1929.

PERSONAL NOTICES.

Deaths.

LUCAS.—On Sept. 10, at Upavon, as the result of a flying accident, L. E. J. Lucas, Plt. Off., R.A.F., second son of Cdr. Lucas of Kevor, Falmouth.

Mr. Lucas was posted to No. 17 (Fighter) Squadron on graduating from the R.A.F. College, Cranwell, on July 27, 1929.

WOODBRIDGE.—At Jask, on Sept. 6, in a night landing accident, Albert Edward Woodbridge, Flt. Lt., R.A.F.O.

One who was his friend writes:—

The death of Albert Edward Woodbridge must have come as the most profound shock to all those who were fortunate enough to know him. To those of us who were with him in 58 Squadron it has caused a gap which can never be filled. His quiet manner made the idea of his ever having a fatal crash seem an impossibility.

Like the late Sq. Ldr. Walter Longton he had that virtue—perhaps born of long association with flying, and perhaps due to an indefinable something in his make-up—which gave one complete confidence in his being able to come safely out of the worst situation.

Although he never professed to be anything more than a normally good pilot, he was, in his quiet way, something rather out of the ordinary. It is doubtful whether there ever was anybody who could tackle a flying job in the same imperturbable way, deal with the unexpected in the same calm manner and carry it through to what, with him, was always a natural and successful conclusion.

He never lost his temper—he was always just, and above all things, however trying the conditions, he never "spun." A more admirable Flight Commander there could not be.

It is difficult to believe that we shall not see "Woodie" again. The loss of friends is always hard: sometimes Time is more successful in healing the gap than at others: but I do not think that the years will ever dim the memories that we hold of "Woodie," nor shall we ever forget that quiet personality which meant so much to those of us who knew him well.—C. C.

Marriages.

BARLOW—ALLEN.—On Sept. 10, at Bromley, Flt. Lt. E. C. Barlow, R.A.F., to Barbara, daughter of Brig.-General C. B. Norton, C.M.G., D.S.O., and Mrs. Norton, Windsor.

CLAYSON—THORNTON.—On Sept. 7, at Our Lady of Victories Church, Kensington, Flt. Lt. Percy Jack Clayson, M.C., D.F.C. (retired), son of the late Mr. and Mrs. John H. Clayson, of Beccles, to Kathleen, daughter of Mr. and Mrs. William Thornton, of Kelvingrove, Glasgow.

Forthcoming Marriages.

CLIFFORD—BLACK.—The engagement is announced between Flt. Lt. George R. M. Clifford, R.A.F., elder son of the Rev. R. F. M. and Mrs. Clifford, of Chillenden, Kent, and Miss Dorothy Gordon Black, youngest daughter of Mrs. Black, of Chapel, Kingskettle.

GEDDES—LEACH.—A marriage is arranged, and will take place in October, between Andrew James Wray Geddes, R.A. and R.A.F., only son of the late Major M. H. B. Geddes, Indian Army, and Mrs. Geddes, Seaford, Sussex, and Anstice Wynter, elder daughter of the Rev. A. W. and Mrs. Leach, Leasingham Rectory, Sleaford.

McDIARMID—GARDENER.—The engagement is announced between Flg. Off. Duncan Gardiner McDiarmid, R.A.F., Altrincham, Cheshire, only son of John McDiarmid, of Stirling, Scotland, and Dulcia Kathleen, second daughter of the late Norman Gardener, of Ash, Kent.

MULHOLLAND—McCONNELL.—The marriage between Sq. Ldr. Denis O. Mulholland, A.F.C., and Mrs. Félice McConnell will take place at St. Columba's Church, Pont Street, on Sept. 25.

YEATMAN—WRIGHT.—The engagement is announced between Harry Morgan, eldest son of the late Mr. and Mrs. H. O. Yeatman, and Sylvia Marguerite, only daughter of Mr. and Mrs. R. H. Giraud Wright.

Births.

BLOFELD.—On Sept. 15, at a Nursing Home, Alverstoke, to Dorothy, wife of Flt. Lt. Bernard L. Blofeld, R.A.F., Lee-on-Solent—a daughter.

BRODIE.—On Aug. 31, at Lower Topa, Murree, Punjab, India, to Mary (*née* Coates), wife of Flt. Lt. Ian E. Brodie, R.A.F.—a daughter.

WHEATLEY.—On Sept. 13, at a nursing home, to Dorothy, the wife of E. S. Wheatley, D.F.C.—a son (stillborn).

WACO AIRPLANES

THE winning of last season's major air events again demonstrated the characteristic performance responsible for WACO'S leading position in the American Aircraft Industry.

Overseas representation is now being arranged.

ON GETTING BACK TO WORK.—II.

Now that we have the Winter before us in which to think out plans and do a bit of flying in between, with an eye to real business next year, we may find advantage in seeing what other people are doing and what sort of ideas other people have on various phases of aviation. So let us just discuss anything that happens to crop up at the moment.

The kind of material that you find in the editorial notes of high-brow magazines, under the title "Musings without Method," or something of that sort, very often gives people ideas. When you are looking for one thing you are quite apt to strike another. Which presumably is our only excuse for our national unmethodical habit of spending vast sums of money on basic research, in the hopes that something may turn up, instead of concentrating all our money on methodical *ad hoc* research looking for some specific object until we find it, as do the Americans.

Still, as basic research is so essentially English in its lack of method, and as, in spite of our lack of method, we do sometimes discover things that other people don't, and as we always muddle through to victory somehow,—there may be something to be said for muddle-headed thinking.

Two Ways of Looking at It.

First of all, a lot of people lately have been accusing this paper of being too blatantly pro-American. And on the other side of the Atlantic sundry American papers have been cursing THE AEROPLANE heartily for being anti-American, and putting on an English air of superiority and being generally high-hatted. That is all very satisfactory, because it gives us on the Staff of THE AEROPLANE complete assurance that we are being absolutely impartial.

Just by way of showing that when THE AEROPLANE runs down English obstinacy and English stupidity and English Conservatism it is not the only institution in the world which endeavours to stir up its own people by telling them their faults, here is a quotation from America's greatest philosopher, Mr. Will Rogers. In his daily spasm of philosophy in an American paper he writes thus:—

"AMERICAN LIVES FAST,
MOVES SLOW."—WILL.
(Special to *Times-Despatch*.)
Beverly Hills (Cal.), Sept. 11.

So we are the nation that travels so fast, and think all the other countries are still in a covered wagon. Well, some Englishman just went 355 miles an hour in a 'plane yesterday, and almost wept because it was foggy and misty and he was not able to open it up. If you remember, one come over here and run an automobile faster than we can even wreck one, so when it comes to speed we are not exactly what you would call sitting on top of the world. Englishmen live slow and move fast; we live fast and move slow.

Yours,
WILL ROGERS.

The idea of inventing fog and mist on the day when Sq.-Ldr. Orlebar broke the Speed Record, just to make the English performance sound better and to uphold the world-wide legend that our climate is always foggy and misty, is a pleasing touch which is in itself essentially English. It only shows how frightfully English the English-American is.

One of our most essentially national forms of joke is to ascribe a peculiarity to a whole nation and insist on rubbing it in on every possible occasion. Only within the last few years have we ceased to jest on the assumption that every Frenchman lives entirely on frogs—and we have only given up the joke because some of us have discovered that frogs as eaten in France are extraordinarily good.

That this particular type of joke still persists is shown by the rumour that as the result of having Italian cooks at Calshot the Mess cat had been found strangled in spaghetti. And we still retain the legend that every American talks through his nose, in spite of the insistent proof of the "Talkies" that every American talks through the front teeth that he has not got.

"YOU MORTAL ENGINES, WHOSE RUDE THROATS THE IMMORTAL JOVE'S DREAD CLAMOURS COUNTERFEIT."
(SHAKSPEARE—*Othello*.)

ON THE RIGHT ROAD.—The great Dornier Do.*x*.—in which the designer has shown one way of using engine-power efficiently.

Digitized by Google

Leg-Pulling.

Anyhow, if Mr. Will Rogers is going to crack up England and at the same time pull our leg about our climate, when in fact the Solent on Schneider Day proved definitely to all our foreign visitors that we have quite the most perfect climate in the world, even those of our American friends who suffer from the worst kind of aeronautical indigestion must allow us to pull their legs in a friendly way.

On the other hand, our good old-fashioned stolid English manufacturers must stand having their defects exposed, and having their legs pulled, because, in their own interests, they must realise that there is a younger generation growing up which has been brought up on Movies and Talkies and American literature, and expects to be amused as well as educated when it is reading its own particular aviation paper. Dulness does not necessarily carry with it either knowledge or dignity.

Apropos which, somebody who is rather anti-The Aeroplane, and has good reason for being so, remarked the other day that people do not take The Aeroplane seriously, they just read it and laugh and throw it away. Whereupon the bright member of the Staff said that, anyhow, that was better than being thrown away without either being read or providing a laugh—which is what happens with some aviation papers. Moreover, a thing which gives a laugh is more likely to remain pleasantly in the memory than is a lot of dull stuff which one forgets as soon as it has been read, or sends one to sleep when one is reading it.

The Finger On the Trigger.

Incidentally, Mr. Will Rogers, besides being America's greatest philosopher, is also one of America's greatest influences, and that jibe against his fellow-countrymen that they live fast and move slowly may be just the pull of the trigger which will start up a big movement in the States to win back the Schneider Trophy from us two years hence.

America can very well afford to challenge us. Mr. C. M. Keys, who is regarded in the States as being to Air Transport what Harriman was to the development of American Railways, is the moving spirit in a little group of aircraft firms which is capitalised on the Wall Street market at about £35,000,000. So that group alone can very well spare half a million or so to polish up America's somewhat smudged shield. Therefore, remembering Mr. Ramsay MacDonald's definite pledge that we shall defend the Trophy when challenged, somebody had better set to work now thinking about new speed machines for the next Contest.

One knows that Mr. R. J. Mitchell has plenty of ideas for increased speed, even without increasing power very much. And there must be lots of bright young designers in the aircraft business who can give even him a run for his money if only someone will give them a chance.

High-Speed Transport.

Talking of speed, we ought to begin looking over our air transport propositions with an eye to putting them on something like an efficient basis. When the aforesaid Mr. C. M. Keys was over here a week or two before the Schneider Trophy Contest, he told one something about his ideas on air transport. The greatest pity in the world is that he is not running an unsubsidised air-line from England to Australia on the same schemes that he has for American air transport.

When one was in the States five years ago, the American Post Office itself was already running the trans-Continental air mail between New York and San Francisco at an average speed of 100 miles an hour. Every day a machine left New York simultaneously with a machine from San Francisco. And, flying short stages of between 200 and 300 miles, changing over to relief machines and pilots at each stage, Uncle Sam's mails crossed the 3,000 miles of Continent in 30 hours. Now they are going to do it in 20 hours at 150 m.p.hr.

The line had been organised by one of the few really big men one has ever met, one Colonel Paul Henderson, who was then Assistant-Postmaster-General. Paul Henderson then laid down the axiom that the success of an air line lies on the ground. And that statement is as true to-day as it was when he started the Trans-Continental in 1923.

Right up to 1926 or 1927 the American trans-Continental mail was carried by old war-time machines which were a kind of modified D.H.4, with Liberty engines. Those old things could cruise at 100 miles an hour with a goodly load of mail. But they depended for their regularity on the marvellous lighting arrangements and signalling arrangements of the air route, and on the fact that they had a landing ground every three miles into which they could get without killing anybody.

There are still English humorists of the Victorian type who say: "You don't catch me going up in an aeroplane unless I can fly with one foot on the ground." Paraphrase

MORE PROGRESS.—Filton Aerodrome, Bristol, at the Club's farewell party. The buildings at the back are now the quarters of an R.A.F. Squadron.—("Aeroplane" photograph.)

The reliability and efficiency of the Napier engine has been proved not only on actual service, but on the following unequalled flights by the Royal Air Force :—

The greatest formation flight ever carried out was achieved by four Royal Air Force Supermarine "Southampton" flying boats, each fitted with two NAPIER engines, which flew from England to Australia and back to Singapore—180,800 engine miles without mechanical trouble.

The first non-stop flight from England to India was carried out by a Royal Air Force Fairey monoplane fitted with NAPIER engine—4,130 miles in 50 hours 38 minutes.

Sir Henry Segrave used a Napier engine when he piloted Sir C. Wakefield's motor boat Miss England at a speed of 92.8 m.p.h.—a record for single-engined motor boats.

that by saying that all flying should be organised with one eye on the ground, and you have plain common sense of the kind that makes money.

Our Conservatives.

We, with all our Government subsidies and modern science, are still content with air liners which cruise at about 80 miles an hour. We make no attempt to provide a really efficient mail service. We do not advertise our air mails. And we do not even issue an air mail stamp to encourage the young to persuade their elders to use the air mail. And we trust to luck, so far as ground organisation goes.

We do not even try to make our air lines a comfortable method of travel, for we still insist on using the most uncomfortable chairs that were ever invented, just out of sheer obstinacy. After all, even in an Argosy there are only twenty chairs, and they could be replaced by comfortable chairs at a cost of about 17s. 6d. each—which is nothing on the price of a machine which probably costs about £20,000.

One result of using slow machines is that instead of finishing their journeys in daylight, they are constantly being caught in the dark on the Cairo-Karachi route. Some readers will remember a vivid description by Air Vice-Marshal Sir Geoffrey Salmond, at the Middle East Dinner, of the beauties of Baghdad at night when seen from the brilliantly lighted saloon of an Imperial air-liner. It may have been very beautiful. But the whole point is that the thing never ought to have been flying at night over an unlighted route without frequent landing-grounds.

The Jask Affair.

That fatal accident at Jask the other day is another example of our muddled and inefficient way of doing things. If we had been using faster machines there would not have been any night landing, and there would not have been any wing-tip flares. Whatever may be the result of the official inquiry, that fact cannot be denied.

Whether the flare burst in the air and set fire to the wing-tip, or whether, landing on flat featureless desert, the pilot, in spite of being one of the best on the line, misjudged his height and crashed the machine before the flare had gone out, and so set it alight, does not matter in the least. The point is that the thing ought never to have been landing by its own lights.

Either it ought to have been landing by daylight, as a faster machine would have been, or else, if there is going to be any night flying at all, it ought to be done as organised night-flying over a properly lighted route, with proper flood-lights and beacons on the aerodromes, and with emergency landing-grounds, each with an automatic flicker-light every four or five miles, just as they have had in America for the past six or seven years.

The Channel Accident.

That instance of the old Handley Page machine which sat down in the Channel and drowned seven people is another example of our muddled methods in acting and thinking. The official inquiry showed that the prime cause of the accident was the breaking of the bolts of one of the big-ends of one of the connecting-rods of one of the twelve cylinders of one of the two engines. The engine stopped. And the machine could not keep its height on one engine.

The breakage happened fifteen miles out at sea on a thirty-mile crossing of the Channel. The pilot made a gallant effort to get back to the English coast. He got within three miles of it, which shows that he was highly skilful. And apparently he did what hundreds of first-class pilots have done, he misjudged his height over a glassy, calm sea, stalled the machine, and went in nose first, hard enough to throw him out of the cockpit and to stun a number of the passengers inside so that they were drowned instead of getting out of the door at the back of the cabin.

Some people blame the engine-makers for not using the right steel in their connecting-rod bolts. That is nonsense, because there is nothing the matter with Napier material. Nobody uses any better, because there is none better to be had.

Some people blame the maintenance staff of Imperial Airways because, they say, they ought to know by experience that the life of a connecting-rod bolt is so many hundreds of hours, and they ought to be replaced before that time arrives. That is nonsense, because even the best of material may have a flaw in it, and one of those bolts might have burst after a perfectly new engine had been flying for an hour or so. And, according to the latest metallurgical theory, unless there is a flaw to begin with, fatigue in metal simply does not happen. The modern high-brow metallurgist regards the fatigue of metals as a kind of old-fashioned religion—and probably he is just as wrong as the people who do believe in fatigue.

Some people blame the builders of the machine, Handley Page, Ltd., for not having their own slots on their own machine. They say that if the machine had had slots it might have pancaked into the water, but it could not have stalled and dived into the water. That is true up to a point, but when that machine was built, automatic slots had not been developed—at any rate for big aeroplanes.

Some people blame the pilot for stalling the machine. They say that even if he could not see the surface of the water, he had, at any rate, a fishing-boat close by to give him some sort of idea of his height. That is equally nonsense. Probably the boat was not where he could see it, although it was quite close. And when you have been holding a soggy machine in the air for twelve miles, flying it with one engine and holding it up with the rudder against the engine, you are not particularly likely to be sensitive to the fine line between sinking and stalling.

Some people say that Imperial Airways ought not to have had a twin-engined machine on the route at all. That is nonsense, for several reasons. A properly designed twin-engined machine ought to be much more efficient than a three-engined machine, in that, not having a third engine, there is no third engine to waste most of its power in pushing its slipstream past an enormous fuselage.

A three-engined machine with one engine in the nose is probably the most inefficient method possible of using power. But it will take the world at least another three or four years to realise that interesting economic fact. We have got the three-engine craze, and it just has to burn itself out. Merely because we have become accustomed to the silly inefficient single-engined tractor machine we cannot get away from the idea that if we have three engines one of them must be stuck in front of the fuselage regardless of the size of the fuselage.

Some people say that every twin-engined machine ought to be able to climb and fly on one engine. That is probably right. But before we can make a machine of that sort we have got to learn a great deal more about how to use our power efficiently. With full load the American-built amphibian Sikorski flies, and is said to climb, on one of its two engines—at any rate, so long as it is new. But it does it because of light structure-weight, and not because of any aerodynamic novelty. It could easily be improved in that direction.

AN AUSTRALIAN MONOPLANE.—The Lascoter monoplane (240 h.p. Puma engine), designed by Mr. W. S. Shackleton and built by the Larkin Aircraft Supply Co. Ltd., of Melbourne. This machine has been designed to suit Australian conditions and carries five passengers in an enclosed cabin on a range of 600 miles. The fuselage is of metal and the wings of wooden construction. Thus Australia advances faster than we do.

The first thing we must do is to give up using tractor-screws and take to pushers. And then must put our pusher-screws where they do not get in the way of anything. Doctor Dornier and Doctor Rohrbach taught us years ago one way of doing the job. Mr. Koolhoven showed us quite an interesting way some few years ago of using a third engine economically. The only machine in this country that goes anywhere near using its twin engines economically is the little Saro Cutty Sark.

All existing methods of placing airscrews could almost certainly be improved vastly by the expenditure of a very few thousand pounds on experimenting with shaft drives. The cost of such experiments would probably be paid for in twelve months by the saving in the petrol bill of one big air-liner. But we simply will not do it, because we are so beastly obstinate and so infernally stupid.

A Matter of Organisation.

Still, these arguments about that Channel accident do not really cut any ice. If the thing had had five engines they *might* all have stopped at once. Three engines are no kind of a guarantee of safety. In fact, as Mr. Grover Loening is so fond of arguing, they merely increase the fire-risk. And in some ways they increase the risk of accident through error of judgment on the part of the pilot.

When we get down to hard facts, the cause of that accident was purely and simply bad ground organisation. No land machine ought ever to be out at sea.

If that particular machine had been on its proper course between Dover and Calais, the stoppage of one engine would not have mattered. Although he was not high up, because of low clouds, the pilot showed that with his one engine he could get back twelve miles out of fifteen. So, even if his engine had packed-up exactly half-way in the twenty miles between Dover and Calais, he would still have had two miles to spare whichever way he went. And if it had happened at fifteen miles out, as it did, he would only have had five miles to go to reach the beach on the French side. But, on the other hand, both of his engines might have stopped at once, as Mr. Glen Kidston's three engines did in the middle of Africa.

The cause of the accident as an accident does not matter a scrap. There are so many tens of thousands of little things which *can* happen in any transport vehicle in the world to stop it suddenly, that we are merely fooling our selves and trying to fool the rest of the world if we pretend that we can assure safety either by infallibility of our power plant or by multiplicity of engines. *The only way to assure safety in air transport is to assure that when a machine has got to come down it can come down safely.*

Water-Craft.

If an aeroplane has to fly over miles of water, then it must either be a seaplane proper, or an amphibian, or it must be like those French Naval machines, made by M. Levasseur, which drop their undercarriages and alight on a boat-bottom with a comparatively water-tight fuselage.

We are still a long way from the ideal amphibian. Our good friend Mr. Grover Loening probably knows more about amphibians than anybody else in the world. He has produced an amphibian which is very little heavier than any standard tractor biplane of its size and power, and it has an almost identical performance. But, all the same, it is not pretty, and it might easily be improved, because it is an ordinary tractor biplane with masses of centre-section struts and bracing-wire and things, and its fuselage comes down direct onto its floats, which definitely cuts the slip-stream in two at a critical place.

There are vast opportunities for really good amphibian flying-boats. But so far everybody has gone about designing such craft with too much of the idea of a motor-car designer trying to design a new chassis.

Years ago the Fairey Company designed a seaplane in which a wheel could be protruded at will through the bottom of each float. That idea has never been developed for big seaplanes. And one believes that even a better job could be made by adapting that same notion to a flying-boat.

Retraction.

After all, a flying-boat ought to be very much more efficient than a land machine of the same capacity, even though it may be a bit heavier. Any land machine, as at present designed, must have wheels and a long ugly undercarriage sticking out, all of which increase head resistance immensely. The retractable undercarriage as an idea is as old as the hills, but nobody has ever thought the development of it to be worth while.

Personally, one believes that one of the most promising lines of development, especially for machines of moderate size, up to, say, the six- or eight-seater cabin job, would be a float machine with a wheel in each float, after the manner of the Fairey Pintail, or the new Loening, but so designed that the floats can be retracted up against the bottom of the fuselage, thus making the fuselage and floats into one very respectable streamline body which could be pushed through the air with much less work.

Chances for Somebody.

Anyhow, there are those ideas free gratis for any intelligent young aircraft designer to work them out for himself. Of course, nearly all the senior designers in this country will just laugh at them and go on making their old-fashioned ideas till ultimately they retire on a pension, or die of cerebro-sclerosis, otherwise hardening of the brain—which is one degree worse than softening of the brain. But some of the youngsters who have intelligence may work something out of these notions, and when some of the senior designers of some of the older firms die off they may have a chance to develop them.

Or, better still, they may get a chance when some of the young firms which are now starting up develop into something big, and begin pushing the old firms out of the market. That is what happened in the cycle trade, and what happened in the motor trade, and it has happened in the soap trade and the tobacco trade and every other trade. Old firms stick to their old ideas and the young ones come along and push them out.

(*To be continued.*)

THE ROYAL AERONAUTICAL SOCIETY.

The following is the programme of lectures to be given before the Royal Aeronautical Society:—

Thursday, Oct. 10.—Mr. C. R. Fairey, M.B.E., F.R.Ae.S., "The Range of Aircraft." Oct. 24.—Capt. N. MacMillan, M.C., A.F.C., A.F.R.Ae.S., A.M.I.Ae.E., "The Art of Flying Land and Sea Machines."

Nov. 7.—Dr. A. E. Dunstan, "Recent Developments of Fuels and Dopes for Aircraft Engines." Nov. 21.—Mr. L. W. Johnson, "The Inspection of Materials." Nov. 28.—Sq. Ldr. H. M. Probyn, D.S.O., "Flying and Maintenance from the Owner's Point of View."

Dec. 5.—Senr. J. de la Cierva, "Recent Work on the Autogiro." Dec. 12.—Dr. W. Rosenhain, D.Sc., F.R.S., "The Development of Materials for Aircraft Purposes."

The lectures in all cases will be delivered in the Lecture Hall of the Royal Society of Arts, 18, John Street, W.C.2. They will begin at 6.30 p.m., with the exception of the lecture on Nov. 21, which will begin at 7.45 p.m. and will be a joint meeting with the Institution of Automobile Engineers.

Visitors are admitted to any lecture on signing the visitors' book with their full name and address.

MORE PEACEFUL PENETRATION.

The Travel Air Manufacturing Co. of Wichita, Kansas, one of the best known manufacturers of commercial aircraft in the United States, is establishing a factory near Montreal, Quebec.

A New Armstrong Siddeley Engine —the GENET MAJOR

Front view showing the enclosed Valve Gear and streamline rocker covers.

THE 100-110 h.p. Genet Major represents the results of ten years' continuous progress in the design and manufacture of air cooled radial engines. It embraces many of the most successful features of the latest Jaguar, Lynx and Mongoose engines and is specially suitable for powering light aircraft and multi-engined aeroplanes.

LEADING FEATURES:

5 cylinders 4.25" or 108 mm. x 4.5" or 114.3 mm. 319 cubic inches or 5.23 litres. Compression ratio 5.23 to 1. Normal r.p.m. 2200. Rated normal B.H.P. at sea level 100, actual 103. Maximum B.H.P. at sea level 110. Weight complete with two magnetos, carburettor, air intake, propeller hub and tachometer drive 250 lbs. or 113.5 k.g. Overall measurements: diameter 38" or .95 m., length 36.2" or .905 m.

THE ROYAL AIR FORCE.

The London Gazette.

Sept. 17.

ROYAL AIR FORCE.

GENERAL DUTIES BRANCH.—The following are granted perm. comns. as Plt. Offs. with effect from Sept. 7, and with seniority of Sept. 7, 1928:—F. J. St. G. Braithwaite, H. P. Fraser, R. Harston, G. J. C. Paul. R. C. Noble is granted a S.S. comn. as a Plt. Off. on probation with effect from Sept. 9 and with seniority of Aug. 30.

The following are granted temp. comns. as Flg. Offs. on attachment for duty with the R.A.F. (Sept. 8):—LTS., R.N.—T. G. Carey, K. Williamson. SUB-LTS., R.N.—A. J. Tillard, C. D'O. Umfreville, D. A. H. Hornell. MATE, R.N.—H. H. Gardner. LT., R.M.—G. K. Martyn.

The following Plt. Offs. on probation are confirmed in rank:—J. A. Easton (Aug. 7); J. E. Beynon, C. C. C. Manson, C. Ray (Sept. 14). The following Plt. Offs. are promoted to the rank of Flg. Off.:—E. R. White (July 9); O. I. Gilson (Sept. 16).

Sq. Ldr. H. E. M. Watkins, A.F.C., R.D., is placed on the retired list and is granted permission to retain the rank of Wing Cdr. (Sept. 15).

The following are transferred to the Reserve:—CLASS A.—Flt. Lt. J. J. Nolan, Flg. Off. W. F. Rimmer, Flg. Off. C. W. Switzer (Sept. 15); Flg. Off. F. T. Stacey (Sept. 18). CLASS C.—Flg. Off. J. A. C. Florence, Flg. Off. L. R. Mizen, Flg. Off. R. J. Stevens (Sept. 15).

Flg. Off. G. B. Collet relinquishes his S.S. comn. on account of ill-health (Sept. 15). The S.S. comns. of the following Plt. Offs. on probation are terminated on cessation of duty:—F. R. Bevan, G. R. O'C. Lempriere (Sept. 13); K. R. Garle (Sept. 17). Flg. Off. P. N. R. Hallward (Lt., The Border Regt.) relinquishes his temp. comn. on return to Army duty (Sept. 12).

MEDICAL BRANCH.—Flt. Lt. J. Hill, M.B., is granted a perm. comn. in this rank (Sept. 18); Flg. Off. G. T. O'Brien is promoted to the rank of Flt. Lt. (Sept. 8); Sq. Ldr. J. H. Peek, M.D., D.P.H., relinquishes his S.S. comn. on account of ill-health and is permitted to retain his rank (June 19). (Substituted for the notification in the *Gazette* of June 21).

CHAPLAINS BRANCH.—The Rev. C. P. N. Rowband is granted a S.S. comn. as a Chaplain with the relative rank of Sq. Ldr. (Sept. 6).

RESERVE OF AIR FORCE OFFICERS.

GENERAL DUTIES BRANCH.—The following are granted comns. in Class AA (ii) as Plt. Offs. on probation:—P. E. Hudson (Sept. 2); L. E. Hunt (Sept. 4). The following Plt. Offs. are promoted to the rank of Flg. Off.:—D. Price, C. R. F. Wintringham (Sept. 14); H. St. G. Burke, R. W. Burkitt, R. W. H. Knight (Sept. 15); E. D. Mills (Sept. 16).

Plt. Off. A. G. Douglas is transferred from Class AA (ii) to Class C (Sept. 15); Plt. Off. H. Clive-Smith is transferred from Class C to Class AA (ii) (Aug. 9). The following relinquish their comns. on appointment to perm. comns. in the R.A.F. (Sept. 7):—Flg. Off. H. P. Fraser, Flg. Off. G. J. C. Paul, Plt. Off. F. J. St. G. Braithwaite, Plt. Off. R. Harston. Plt. Off. F. O. Ticknell resigns his comn. (Sept. 9).

Appointments.

Week ending Sept. 23.

GENERAL DUTIES BRANCH.—Air Vice-Marshal H. C. T. Dowding, C.B., C.M.G., to H.Q., R.A.F., Transjordan and Palestine, on appointment as Air Officer Commanding, 7/9.

Group Captain C. T. Maclean, D.S.O., M.C., to H.Q., Aden Command, to command, 5/9.

Wing Commanders R. Leckie, D.S.O., D.S.C., D.F.C., to Station H.Q., Bircham Newton, to command, 5/9. T. O'B. Hubbard, M.C., A.F.C., to H.Q., 'Iraq Command, for duty as Station Commander, 13/9. J. K. Wells, A.F.C., to No. 15 Sqdn., Martlesham Heath, to command, 2/9.

Squadron Leaders C. E. H. James, M.C., to H.Q., Inland Area, Stanmore, 2/9. G. W. Bentley, D.F.C., to R.A.F. Depot, Uxbridge, 23/9. E. F. Turner, A.F.C., to H.Q., Coastal Area, 9/9. H. G. R. Malet, to No. 4 F.T.S., Middle East, 13/9. F. Workman, M.C., to R.A.F. Depot, Middle East, 13/9. A. N. Gallehawk, A.F.C., to H.Q., R.A.F., Transjordan and Palestine, 7/9. W. H. Dolphin, to R.A.F. Depot, Uxbridge, 24/8.

Flight Lieutenants A. H. Paull, to R.A.F. Depot, Uxbridge, 5/9. H. M. Whittle, to H.Q., R.A.F., Mediterranean, 1/9. R. Whitaker, M.B.E., to No. 3 F.T.S., Grantham, 2/9. E. G. Hilton, D.F.C., A.F.C., to No. 216 Sqdn., Middle East, 14/9. E. Drudge, M.B.E., to H.Q., 'Iraq Command, 13/9. F. H. Woolliams, to No. 14 Sqdn., Palestine, 13/9. N. W. F. Mason, to No. 504 Sqdn., Nottingham, 16/9. J. E. Butler, to No. 3 F.T.S., Grantham, 9/9. A. King-Lewis, to A. and G. School, Eastchurch, 4/9.

Flying Officers N. A. West, to No. 4 F.T.S., Middle East, 13/9. C. E. Galpin, to No. 4 F.T.S., Middle East, 13/9. N. C. Odbert, to No. 20 Sqdn., Middle East, 13/9. B. W. Figgins, to No. 208 Sqdn., Middle East, 13/9. C. P. Barker, to R.A.F. Base, Gosport, 9/9. F. Townsend, to R.A.F. Depot, Uxbridge, 31/8. W. Anderson, to R.A.F. Practice Camp, North Coates Fitties, 13/9. R. L. Edward, to No. 2 F.T.S., Digby, 2/9. E. L. Wilson, to A. and G. School, Eastchurch, 9/9. W. J. Coadwell, D.S.M., to E. and W. School, Cranwell, 13/9. J. E. Edwardes Jones, to No. 1 F.T.S., Netheravon, 10/9. R. S. Darbishire, to R.A.F. Depot, Uxbridge, 1/9. T. L. Harrison, to No. 504 Sqdn., Nottingham, 10/9.

Pilot Officers C. W. Black, to No. 2 F.T.S., Digby, 9/9. F. J. St. G. Braithwaite, H. P. Fraser, R. Harston, and G. J. C. Paul, to No. 1 F.T.S., Netheravon, on appointment to Perm. Comns., with effect from 7/9. R. C. Noble, to R.A.F. Depot, Uxbridge, on appointment to a S.S. Comn., on probation, 9/9. A. G. M. Cary, to No. 70 Sqdn., 'Iraq, 6/9. F. A. Wardell, to No. 70 Sqdn., 'Iraq, 6/9. R. V. Redpath, to R.A.F. Base, Gosport, 16/9. R. C. Jordan, to R.A.F. Base, Gosport, 9/9. J. C. Allan, to R.A.F. Base, Gosport, 9/9. A. L. Franks, to No. 14 Sqdn., Palestine, 13/9. The undermentioned Pilot Officers are posted to No. 4 F.T.S., Middle East, with effect from 14/9:—K. M. Cass, H. R. Clay, L. A. Cubitt, G. G. Dixon, G. D. W. Frayling, D. W. H. Heath, R. J. B. Hitchen-Kemp, H. de M. Middleton, R. J. Parkhouse, A. C. Richardson, J. B. Tatnall, H. Travis, R. C. Noble. The undermentioned Pilot Officers are posted to No. 1 F.T.S., Netheravon, with effect from 8/9:—R. B. Abraham, M. J. Adam, J. C. Atkins, A. C. Bailey, J. L. C. Banks, D. Barclay, D. Carr, R. J. Cowen, N. Kirkham, A. N. Luxmoore, J. E. C. McClure, R. M. Noblston, A. W. B. Page, M. E. Pickford, W. J. Scott, W. B. J. Sharp, G. E. B. Stoney, G. R. Stroud, L. Watson, R. L. West, A. M. Wood, E. Poole.

MEDICAL BRANCH.—Flight Lieutenants E. J. Jenkins, to Palestine General Hospital, 27/8. J. E. Foran, M.B., to R.A.F. Depot, Uxbridge, 22/8. G. P. O'Connell, M.B., to No. 28 Sqdn., India, 16/8, instead of to H.Q., R.A.F., India, as previously notified. H. C. S. Pimblett, M.B., to H.Q., 'Iraq Command, 13/9. A. E. Vawser, to H.Q., 'Iraq Command, 13/9.

STORES BRANCH.—Flight Lieutenants A. B. Wiggin, to Supply and Transport Services, 'Iraq, 13/9. A. E. Sutton-Jones, to H.Q., R.A.F., Middle East, 13/9.

Flying Officers R. M. Thomas, to R.A.F. Depot, Middle East, 13/9. M. J. Scott, to R.A.F. Depot, Middle East, 13/9.

ACCOUNTANT BRANCH.—Squadron Leader P. A. Simmons, to H.Q., Fighting Area, Uxbridge, 3/9.

Flight Lieutenant E. C. Green, to H.Q., 'Iraq Command, 13/9.

CHAPLAINS BRANCH.—The Rev. W. R. Marsh, B.D., to R.A.F. Depot, Middle East, 13/9.

ERRATUM.—With reference to General Duties Branch of R.A.F. Intelligence, for Flying Officer N. B. Morris, week ending Sept. 10, read Flying Officer N. B. Norris.

Operations in 'Iraq.

The King has approved of the General Service Medal with clasp "Southern Desert, 'Iraq," being granted, provided the claims are approved by the Army Council, to the British and Indian military forces employed in the operations against the Akhwan in the Southern Desert, 'Iraq, under the command of Air Commodore T. C. R. Higgins, C.B., C.M.G., Royal Air Force, between January 8 and 22, 1928, both dates inclusive, or Wing Commander (now Group Captain) E. R.

THE BULL-DOG'S KENNEL.—A series of Jupiter-engined fighters coming through the works of the Bristol Aeroplane Co. Ltd. These machines are the standard equipment of No. 3 (Fighter) Squadron.

ARMSTRONG WHITWORTH
AIRCRAFT

THE ALL STEEL ATLAS

(ON WHEELS, FLOATS OR SKIS)

THE all-steel Atlas is the best aircraft for land or sea reconnaissance.

It is the standard Army Co-operation two-seater of the Royal Air Force.

Its steel construction accounts for its unrivalled durability and ease of maintenance. Fitted with the world-famous Armstrong Siddeley Jaguar engine (plain or geared type), its speed, climb and ceiling fulfil the severest Service requirements. It is produced on the grand scale by the best equipped aircraft works in Europe.

SIR W. G. ARMSTRONG WHITWORTH AIRCRAFT LIMITED

Works and Aerodrome: Whitley, Coventry. London: 10 Old Bond Street, W.1

Digitized by Google

C. Nanson, C.B.E., D.S.C., A.F.C., Royal Air Force, between January 22, 1928, and June 3, 1928, both dates inclusive.

Individuals already awarded the medal will receive the clasp only. The grant of the medal or clasp will not be made in respect of visits to the sphere of operations or of service of a temporary nature.

Extensions of Service.

The following officers have been selected for extensions of the active list period of their short-service commissions as indicated. These extensions are in substitution of any previously notified:—

General Duties Branch (Supplementary List).—*Extension to six years*: Flt. Lt. E. J. Howes.

Stores Branch.—*Extension to nine years*: Flt. Lt. G. W. Longstaff.

Stores Branch (Supplementary List).—*Extension to seven years*: Sq. Ldr. A. Davidson, M.C.

Medical Branch.—*Extension to five years*: Flt. Lt. G. W. McAleer, M.B. *Extension to four years*: Flt. Lt. C. W. Coffey.

Chaplains Branch.—*Extension to eight years*: The Rev. D. F. Stephens, M.A. *Extension to six years*: The Rev. W. P. Hughes, L.Th., The Rev. G. H. Piercy, M.A.

Prize Cadetships.

The Air Ministry announces that the Air Council have awarded Prize Cadetships to the following successful candidates at the examination held in June last for entry into the Royal Air Force College, Cranwell:—

W. E. Oulton (Technical College, Cardiff, University College of South Wales); P. G. A. Diack (Westminster School); P. E. Drew (Marlborough College); H. W. A. Chesterman (Marlborough College); A. C. Johnstone (Edinburgh Academy); E. C. Ingham (Eton College).

Flying Officer H. R. D. Waghorn, A.F.C.

The London Gazette of Sept. 20 announces the award of the Air Force Cross to Flying Officer Henry Richard Danvers Waghorn in recognition of his achievement in winning the Schneider Trophy Contest.

Landing at Cranwell.

The notice of all pilots is drawn to an Air Ministry Order which states that all aircraft visiting Cranwell are to land on the southern aerodrome, on which the duty pilot's cabin is situated.

A Service Contemporary.

The Planesman, a monthly journal for the Royal Air Force, gives all the latest news from R.A.F. Stations at home and abroad. It also gives comprehensive accounts of sports and athletics and has illustrated articles of topical and general interest. It only costs 6d. a month, and those officers and airmen of the R.A.F. who cannot buy it in their Unit should apply to the Editor, *The Planesman*, R.A.F., Eastchurch, Kent.

THE LATE JAMES WINTER.

A fund was organised, at the time of his death in April last, to help the widow of the late James Winter (better known as "Old Jim"), who was a rigger at the R.A.E. He had been connected with aviation since 1905 and was well known to, and respected by, many of the pioneers of Service and Civil aeronautics.

The amount realised so far is £28 11s. This has been handed over to the widow with a list of the donors' names.

Mrs. Winter has asked the treasurers of the Fund,—Sq. Ldr. J. S. T. Fall, D.S.C., A.F.C., R.A.F., and Mr. H. V. Webster, to convey to the contributors to this fund her grateful thanks for their sympathy and help.

Any of the old friends of the late Mr. Winter, who have not as yet heard of this fund, and would like to show their respect for Old Jim, are invited to send along their contributions to the above-named Treasurers at the R.A.E., Farnborough, Hants.

THE SOUTH AFRICAN AIR FORCE.

The South African Air Force has decided to adopt the Avro Avian (Genet Major engine) as their standard training machine, and an order for twenty has been placed with the Avro Company.

Several Westland Wapitis, which type has been chosen as the standard General Purposes type by the S.A.A.F., are now in service.

The S.A.A.F. Depot at Roberts Heights has acquired the licence for the construction of the Wapiti in South Africa, and further examples will be built there.

A FRENCH AIR FORCE MAGAZINE.

The French Ministry of Air has just issued the first number of *La Revue des Forces Aériennes*, which is the organ of the French Military, Naval, and Colonial aviation, and is published with the help and approval of the Air Ministry. This review replaces *La Revue de l'Aéronautique Militaire*, which has ceased to appear since Jan. 1, 1929.

Those who are interested in procuring copies of *La Revue des Forces Aériennes* should communicate with "M. le Général Directeur Général des Forces Aériennes, 3e Bureau, 35, Rue Saint-Didier, Paris (16e.)."

A BLINDING GLIMPSE OF THE OBVIOUS.

This is from *The Patriot* of Sept. 19:—

Sein Fein Bombers.

Sir,—A disgraceful act of anti-British treachery is just announced by the new Socialist Government. It is stated that persons belonging to the so-called Irish Free State's Air Force—which is commanded by ex-gunmen notoriously hostile to this country—are to be allowed to train at the Hanworth air training centre. They are to mix with young British flying men, among whom their presence is undesirable, as tending to seditious disloyalty.

These Sinn Fein airmen are to be allowed to fly over and in the vicinity of London, so gaining local knowledge valuable for attack, such as would not be permitted to the air force of a European Power.

In August, 1928, *The Patriot* announced that a number of fast Fairey Napier daylight bombing aeroplanes had been delivered to the Sinn Fein Government. Its object is clearly to attack London and other British cities from the air. Since then there has been steady increase in bombing aeroplanes, which are not intended, and could not be used except against this country.

Ever since the 1921 Surrender, the so-called Irish Free State has been arming against Great Britain. Mr. Ramsay MacDonald is now clamouring for British disarmament.—Yours, etc.,

R. H. G.

[And we in The Aeroplane office are still wondering whether R. H. G. is a humorist intentionally.—C. G. G.]

WATCHING A PUFF SHOOT.—The Governor-General of Australia, Lord Stonehaven, watching Army Co-operation by No. 3 Squadron, Royal Australian Air Force. Standing is Flt. Lt. C. T. Anderson, D.F.C., Officer Commanding the Army Co-operation Flight of the Squadron.

PROOFS THAT CIRRUS ENGINES ARE

THE WORLD'S MOST RELIABLE LIGHT AERO ENGINES.

¶ The great majority of Light Aircraft of British manufacture are fitted with CIRRUS or CIRRUS HERMES engines.

¶ There are more different types of Light Aircraft of Foreign manufacture fitted with Cirrus engines than with any other power unit.

¶ Cirrus engined aircraft won the King's Cup in 1926 and 1927 and the Siddeley Trophy in 1928 and 1929.

¶ Cirrus engines are in use by the British Royal Air Force and are standardised by National Flying Services Ltd.

¶ Cirrus engines are now fitted in over 40 different types of British and Foreign Aircraft.

¶ Cirrus Hermes engines are now fitted in 19 different types of British and Foreign Aircraft.

¶ The record of Cirrus engines in World Flights, International Competitions, Racing, and in every other activity in which Light Aircraft are employed cannot be approached by any other type of British or Foreign low powered engine.

CIRRUS SUPREMACY IS FOUNDED UPON CIRRUS PERFORMANCE.

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

LIGHTER-THAN-AIR CRAFT.

BY L. HOWARD FLANDERS.

Interest in aeronautical circles is gradually orientating to the view that lighter-than-air craft have a useful field of operation. This is a distinct change in viewpoint from that of a few years ago when any mention of airships was looked on as pure gas.

The change has been to a great extent produced by the repeated failures of aeroplanes to cross the Atlantic from east to west, and the realisation that an aircraft, with all its disposable load in the form of fuel, and a zero pay-load, is not a money-making proposition.

One of the causes of the general aversion to airships was, without doubt, the fear that a fragile and very large structure would not be durable or be capable of weathering the climatic conditions which must be met, even if the meteorological information available is absolutely reliable, in all parts of the World.

Many of the earlier rigid airships were designed to carry concentrated loads when floating in a fairly uniform body of air, and no provision was made for the aerodynamic forces caused by manœuvring at high speeds, or by passing from one form of air conditions to another. A common question was "What will happen to the craft when she strikes a live squall?"

The voyage of the *Graf Zeppelin* has inspired some confidence because that purely experimental and rather small airship has proved itself capable of a World tour.

Aerodynamic research has shown that the form of maximum rigidity and strength is also the form of minimum drag, consequently we may turn our attention to asking questions about certain very important problems which have to be solved before lighter-than-air craft can enter the field of useful transport.

BUOYANCY AND FUEL.

The relation of buoyancy to fuel-load is an essential likely to promote questions.

There are two alternative gases for providing the necessary lift, Hydrogen and Helium, which give a relative buoyancy, when the weights of the containers and aircraft structures are included, of about 13:10. Helium is at present a monopoly of the U.S.A. Though other sources of supply may be available later. (Canada is said to possess helium.)

Fuel is being tried in four forms,—hydrogen, heavy gas (of the same density as air), petrol, and fuel oil.

Of these combinations of fuel and buoyancy gas helium and fuel oil will give a non-inflammable combination. And as far as we know, this combination is not being used in any airship on the stocks or in the air.

The U.S.A. Navy helium airship of 6,500,000 cu. ft. is being constructed for gas fuel, which is carried in envelopes within the hull.

Helium being a very rare gas it is desirable to make provision for conducting all manœuvres without letting out any gas through the valves. This limits the ceiling of the airship to the height at which the helium has filled the containers by expanding as the ship rises into regions of constantly decreasing atmospheric pressure.

One of the advantages put forward for the form of fuel container shown in Fig. 1 is that as the fuel gas is used more space is available for the helium to expand, and thus a higher ceiling is available.

This is of obvious use when a mountain range has to be crossed after several hours' flight, because if there were insufficient space for the helium to fill when expanded it would be necessary to lose a portion of the buoyancy gas through the valves.

On the other hand, if the start of the flight is made from a considerable height the only alternative to the use of the gas valves is an increase of ballast, which can be gained by condensing the water which exists in the form of vapour in the exhaust of the engines. In this the H_2O component of the burnt gas is condensed and run into the ballast tanks. This is, of course, a slow process, and except for a very long flight will not do away with the necessity of wasting helium.

THE FIRE-RISK.

From the point of view of safety from fire it seems that the helium + gas-fuel combination is as great a potential source of danger as is hydrogen + fuel-oil.

On the other hand, if hydrogen gas be used for buoyancy, and provision be made for its use as fuel, if and as required, in combination with a liquid fuel, the use of a ballast-gainer will enable the buoyancy of the aircraft to be adjusted to suit all conditions and the fire-danger is no greater.

A further advantage of hydrogen is the smaller size and cost of the aircraft for a given pay-load:—10: 13.

A great point which has been made in the arguments for the advantage of helium over hydrogen is that helium allows a smoking-room to be provided for the use of passengers. But a heavy inflammable fuel-gas is more likely to penetrate into the passenger accommodation than is hydrogen, which, if it escapes, tends to do so upwards.

R.101 is provided with a smoking-room, which is considered safe because there is no petrol on board; it is not considered safe to smoke on R.100 because there is petrol on board. This shows that the heavy petrol vapour is considered a greater souce of danger than the hydrogen gas.

AIRSCREWS.

To enable changes of altitude to be made without loss of helium gas the U.S. Navy Airship is to be fitted with swiveling airscrews similar to those used in Great Britain by the late E. T. Willows in 1910, and subsequently on the Army Airship *Delta* in 1912. But in the new U.S.A. airship a reverse gear is used, and the screws have only 90° of horizontal rotation, whereas in the earlier example of this mechanism the airscrew centres could be rotated through 360° and thus be used for reversing. The addition of a reverse gear seems a needless increase of dead weight.

GUST DANGERS.

It has been found that in all changes in the velocity or direction of the wind there is a margin of turbulent air, acting as a velocity gradient, which eases the load applied to the airship structure as the craft passes from one atmospheric condition to another. As all modern airships

Various arrangements of airship lifting gas and fuel gas cells. From left to right: Cross-section of the "Graf Zeppelin" showing central corridor between lifting gas and fuel gas cells. An alternative arrangement with fuel gas cells below and on either side of lifting gas cell and with corridor at base of hull. Arrangement with fuel gas cell suspended in the centre and completely surrounded by non-inflammable helium gas cells.

THE "Bristol" BULLDOG

The "Bristol" Bulldog stands out among present-day single-seater fighters as an example of modern steel aircraft construction unequalled in design and workmanship. The performance of the machine is exceptional and its manœuvrability must be seen to be appreciated.

Simplicity is the keynote of the design.

Full military equipment is carried, the arrangement and accessibility of all items having received very careful attention.

"Bristol" aircraft have earned a world-wide reputation for general excellence which has been further enhanced by the advent of the Bulldog single-seater day and night fighter.

"BOTH DOING WELL."—The "Graf Zeppelin" and the Goodyear "Puritan" at Los Angeles, California.

are designed to withstand a sudden change with a factor of safety of 2, there need be little doubt about their airworthiness in passing through any atmospheric condition which has been recorded.

The Ford Mooring Mast at Dearborn, Michigan.

It must not be forgotten that the velocity of the wind, whatever it may be, constitutes no danger to any aircraft suspended in that wind. Change of velocity (which is called a gust) is the source of danger, especially for a large body some 700 or 800 ft. long travelling at about 75 m.p.h., which will take some 7 or 8 seconds to pass through a given point of atmospheric disturbance.

HANDLING.

The handling of an airship is at present rather an unsolved problem. Ten years ago there were ground crews trained to handle the small airships which were then in use. To-day, at any rate in this country, the crews have dispersed and the airships have increased to many times the size. The mooring mast is considered to overcome this difficulty, and our Air Ministry has adopted the 200 ft., or high mast.

The airship riding at the mast is free to swing to the wind through the full 360° in a horizonal plane. But, unfortunately for the development of aircraft, the wind almost always has a vertical component which may be considerable even at the place chosen for the mast.

The use of a high mast necessitates the keeping of a crew on board continuously, and the elevator controls must be constantly manned. In bad weather any lack of attention on the part of the helmsman may easily result in the stern of the airship crashing on the ground. Moreover, the trim and buoyancy of the craft must be watched and adjusted continuously.

The U.S. Navy has been working at the short or stub mast. This mast, which may be 80 ft. high or less, holds the airship just clear of the ground. A system of anchorage is provided to keep the airship horizontal and at the same time allow it to orientate to the wind direction.

Various systems for anchoring the stern have been tried. One method is a system of chains branching from a single chain to two, again to four, and so on to a considerable number. This trails on the ground, and when the stern of the airship rises it has to lift a progressively increasing load, thus finding a position of equilibrium. But this chain also impedes orientation (or swinging in a circle round the mast).

The system which seems to be most satisfactory is a circular rail-track with a rail car of some 5 tons weight running on the rails. The airship has detachable strengthening struts and bracing attached to the ring carrying the rear engine cars. The rail car thus holds the airship rigidly level while free to orientate.

It remains to be seen whether this method of mooring, which virtually holds the hull rigidly at the ends, while it is loaded throughout its length by air currents and alterations of buoyancy due to temperature changes, will be satisfactory.

A sudden change of temperature might easily cause such a continuous load on the hull that it would break its back. It is possible that some means of mooring may be devised such that a strong girder extends from the mast to the trolley and the airship attached at frequent points to distribute the loads.

There is a proposal to make mobile stub-masts to convey the airships from the mooring mast to the shed, when any repair work is necessary. This should be satisfactory in calm air when the airship is not likely to yaw suddenly.

This summary of the present position of airship development shows that many problems are being handled in a manner which will probably result in rapid evolution.

BUSINESS MEN ARE TAKING TO THE AIR

To cross London the business man uses his own car and it is now just as practical for him to travel across Europe in his own Avro 5.

The Avro 5 is equipped with three 100 h.p. Armstrong-Siddeley engines and has a cruising speed of 100 m.p.h. Its carpeted cabin contains chairs for four people. It is electrically lighted, and comfortably ventilated. There is, in fact, everything necessary for convenient and pleasurable travelling. The Avro 5 can land in 330 yards and can be left anywhere in all weathers. To own one is to be utterly independent of all public transport arrangements and to be able to travel anywhere at any time with speed, safety and comfort.

AVRO·5

(3 ENGINED MONOPLANE)

Specifications and full particulars of the above, also of the larger Avro-10 (carrying 8 passengers) will be supplied on application. Those interested should write for free catalogue of the famous "Avian" light aeroplane.

THE REPORT OF THE AERONAUTICAL RESEARCH COMMITTEE.

[*Aeronautical Research Committee. Report for the year* 1928-29. Published by H.M. Stationery Office, and obtainable from THE AEROPLANE Book Department, Cannon House, Pilgrim Street, E.C.4., at 2s. 0d.]

The Aeronautical Research Committee, which co-ordinates all the aeronautical research work and investigation throughout this country, has recently published its annual report.

Much of the Committee's work in the immediate future is to be concerned with the reduction of the difference existing between the performance of present-day aircraft and the Ideal. Widespread attention has been drawn to this difference by the published investigations of Professor B. M. Jones.

A further result of these investigations appears to be the need for making the airflow past a model in a wind-tunnel turbulent. "Scale effect," for which an allowance has to be made in the prediction of full-scale resistance from models, is probably due to the fact that the airflow past the model is not turbulent, whereas the flow past the full-size body is in that condition. This question of turbulence and also the method of its introduction into the wind tunnel is to receive further attention as being of primary importance.

The N.P.L. are making a series of experiments to determine how the drag of streamline bodies is affected by the interference of small bodies, or wing roots, attached to the surface of the original body. Such additions appear to have less effect when placed aft of the maximum cross-section.

A lot of work has been done on wing-radiators. Electrically heated platinum strips arranged on a model R.A.F.26 aerofoil have been used for these experiments. As each strip forms part of a separate circuit the dissipation of heat can be determined. Tests made with this apparatus have given results agreeing well with the tests made at the R.A.E. on the full-size Gloster and Supermarine wing radiators. Further experimental work shows that appreciably better cooling is obtained forward of the front spar.

One feels that although the knowledge gained with this apparatus will of course prove useful, it will not help the designers of racing aircraft much as the wing area is already insufficient for the adequate cooling of the racing engine. The next step is surely in the adoption of ethylene-glycol for cooling.

A compressed air tunnel to withstand a pressure of 25 atmospheres and with a working diameter of 6 feet is now being constructed for use at Teddington, where the N.P.L. live.

The Report emphasises the need for a full-size tunnel of about 24 feet diameter. This is a need which THE AEROPLANE heartily endorses and to which Editorial reference has often been made.

Further evidence as to this need, if any were required, is a statement in the Report which says that the overall drag of an air-cooled radial engine can be greatly reduced by the use of helmets over individual cylinders. The overall drag *can* be reduced, but the helmets cause overheating of the cylinders. If the helmets are so modified that the cylinders stay cool, the helmets are not much use for drag-reducing purposes.

The Americans were able to find all this out with comparatively little delay because they could rig a full-sized engine up in their big tunnel and have it running under its own power.

The N.P.L. have found that helmets reduce drag on models but not until full-sized helmets can be tried out on engines will the required modifications for cooling be discovered. What value will the modified helmets have for drag reduction?

The Report suggests that if a full-size wind-tunnel is constructed the Aircraft Industry should assist towards the cost of maintaining and operating it.

The report refers to the device produced by Mr. H. C. H. Townend for the reduction of the drag of air-cooled radial engines. As is now well-known, this device is a ring of streamline section and large diameter placed round or in front of the engine.

This device came out about the same time as the N.A.C.A. cowling, which is certainly having a great success in the United States.

The point of the N.A.C.A. cowling is that not only is there a cowling to improve the airflow past the engine and thus decrease the drag, but that there is a special system of internal cowling and deflectors to ensure adequate cooling.

Furthermore, on radial engines with only three or five cylinders, both the Townend Ring and the N.A.C.A. cowling are found to be a disadvantage, and on engines placed close beneath the wing—as are the wing engines of the tri-motor Ford—the N.A.C.A. cowling slows the machine. A different type of cowling is then necessary.

Airscrews have received a lot of attention. The mutual interference between an airscrew and a body behind it has been investigated. Experiments have been made with airscrews running at high tip speeds—80 and 90 per cent. of the velocity of sound. A symmetrical section R.A.F.27 gave the best results.

The United States of America have been making tests in four of their wind-tunnels of the International R.A.F.15 aerofoil section sent to them by the N.P.L. There is some difference in the technique of testing at the different tunnels and this may account for the differing results. The agreement between the results obtained in the American wind-tunnels is of the same order as that obtained between the tests made in the various tunnels at the R.A.E. and N.P.L.

The Report refers to the theoretical and experimental work which has been done on the subject of Fluid Motion, such as the flow around cylinders, and also around aerofoils, at low wind speed.

No work except of an incidental nature has been done on gyroplanes, generally called Autogiros.

The Stability and Control Sub-Committee have come to the conclusion that the recording apparatus at present used in stability and control tests is too complicated. The next step must be the provision of simpler apparatus.

The Report admits that the problem of an aeroplane which will not come out of a long spin is still incompletely understood. The more the matter is investigated, the more varied the types of spin appear to be that cause trouble on different machines.

There is not much information available about the aerodynamic behaviour of servo controls, so measurements are to be made of relative rudder and servo movements.

A special Sub-Committee (now deceased) has investigated the various problems concerning the airworthiness of rigid and non-rigid airships.

A method of investigating the flutter of aeroplane wings has been evolved. This consists in making cinematograph records of a model wing of reduced elasticity in a wind-tunnel. This apparatus provides a satisfactory means of investigating flutter problems of a wing actually in existence. Further work is being undertaken to find means of preventing flutter. Tail flutter is also being investigated.

The Report mentions the adoption of the Fairey IIIF seaplane as the standard machine for seaplane research. A new high speed tank for trying-out seaplanes and flying-boat models is to be built at the R.A.E. The development of camera guns for timing high-speed machines is noted. Presumably this is the method used for timing the attempts on the World's Speed Record.

Mr. H. Constant, at Cambridge University, has investigated the Torsional Vibration of Crankshafts and a formula for the stiffness of a crankshaft out of bearings has been evolved. The R.A.E. are now engaged in testing the synchronous speeds of as many engines as possible to test the accuracy of the data prepared by Cambridge.

The Report states that Mr. Ricardo in his experimental works at Shoreham has been doing a considerable amount of research based on the compression-ignition engine. Such research has been made on 4-cycle and 2-cycle units of a sleeve-valve type engine. The research has been carried to such a point that the successful development of a complete engine is not far off.

Mr. Ricardo has also been making tests with high-speed sleeve-valve petrol engines. These have been run at 5,000 r.p.m., successfully maintaining a high M.E.P.

One may add that much experimenting on these lines has been done also by Mr. Fedden at Bristol.

Sq. Ldr. Helmore has made a series of experiments at Cambridge with a water-cooled aero-engine using gas fuel and also a combination of gas and liquid fuels. Further work is to be done with the combined fuels.

The R.A.E. have designed a petrol flowmeter which is sufficiently accurate under all conditions of temperature. Accurate measurements of fuel consumption in the air is now possible.

These flowmeters have been used by an R.A.F. squadron flying in formation and showed the possibility of effecting a large reduction in average petrol consumption. At the same time the wide disparity in consumption between aircraft flying in the same formation was reduced.

Various researches concerning the elasticity and fatigue of metals have been made, especially with regard to the fatigue properties of single crystals of metals.

Research in recent years has shown that the fatigue of metals, more especially the light metals such as duralumin, is accelerated by the presence of corrosive agents. The Report points out that the Committee are closely in touch with the American Investigator of this problem.

At Oxford University experiments have been made to determine the effect of the frequency of the alteration of stress upon the fatigue limits of metals. Some of the frequencies investigated were as high as 20,000 per second.

THE WESTLAND FOUR.—The latest product of the Westland Company with three Cirrus-Hermes engines which has been bought by Imperial Airways Ltd.—(*"Aeroplane" photograph.*)

One result of the growing popularity of all-metal construction is that the Aircraft Industry wants to know something about the strength of panel bracings for fuselages. Experiments are therefore to be made as to the conditions and manner of failure of rectangular duralumin panels clamped in a pin-jointed frame and subjected to shearing forces.

The Report states that as chill-cast test bars of aluminium alloys give test results higher than those obtained from the actual sand castings, sand-cast test bars are to be used. Work will be done to enable the B.E.S.A. (British Engineering Standards Association) to adopt sand-cast test bars.

An intensive investigation of the properties of magnesium alloys and the prevention of their corrosion is to be undertaken. Commenting here one would point out that the Germans have been using Electron, which is a magnesium alloy, for some considerable time. English visitors to the Berlin Exhibition were much impressed by this material. There was also a British Company at the Aero Show exhibiting magnesium alloys.

A Sub-Committee has been formed to discuss Aircraft noise.—Will this Committee hold its seances in a giant-airliner? Probably not, as no doubt the vibrations both audible and supersonic would induce fatigue.

The Report closes by referring to the cordial relations existing between the A.R.C. and the N.A.C.A., which amity has recently been sealed by an exchange of instruments.

T. J.

AERONAUTICS AT SOUTH KENSINGTON.

The Department of Aeronautics of the Imperial College of Science and Technology, at South Kensington, has now issued a syllabus of the lectures to be delivered during the Session 1928-30.

The officials of the Department of Aeronautics are as follows:—

Zaharoff Professor of Aviation and Director of the Department.—Leonard Bairstow, C.B.E., F.R.S., A.R.C.S.

Professor of Meteorology.—Sir Gilbert T. Walker, C.S.I., Sc.D., Ph.D., F.R.S.

Assistant Professor.—Design and Superintendent of the Drawing Office.—F. T. Hill, F.R.Ae.S., M.I.Ae.E.

Lecturer on Airships.—V. C. Richmond, O.B.E., B.Sc., A.R.C.S., A.F.R.Ae.S.

Lecturer on Air Navigation and Instruments.—A. P. Rowe, A.R.C.S., B.Sc., D.I.C., A.F.R.Ae.S.

Lecturer on Strength of Structures.—W. S. Farren, M.B.E., M.A.

Lecturers on Engine Design.—H. Moss, D.Sc., A.R.C.S., D.I.C.; W. J. Stern, B.Sc., A.R.C.S., D.I.C.

Demonstrators.—E. W. Bliss, M.A., B.Sc., A.Inst.P.; T. Tanner, A.C.G.I., D.I.C.

Professor's Assistants.—Miss B. M. Cave-Browne-Cave, M.B.E., A.F.R.Ae.S.; Miss E. D. Lang, M.A., A.F.R.Ae.S.

Workshop Assistant.—G. A. Locke

Lectures on special subjects will be given by some of the Professors and Lecturers of the College.

The department was established in 1920-21 in part to give effect to the scheme proposed by the Committee on Education and Research in Aeronautics in their Report, dated Dec. 12, 1919, in which the opinion was expressed that "The Imperial College should become the Central School for advanced study in Aeronautical Science."

The Report [Cmd. 554] described the organisation by which this should be done, and in accordance with its recommendations, which were approved by the Government, funds have been placed at the disposal of the College for the purpose.

The School is administered by the Governing Body, with the assistance of an Advisory Committee, which reports to the Executive Committee for the College.

The Advisory Committee consists of 12 members, with Mr. Herbert Wright as Chairman. The members represent the Imperial College, the Air Ministry, the Aeronautical Research Committee, the University of Cambridge, the Royal Aeronautical Society and the Society of British Aircraft Constructors.

The School is in the main a post-graduate one, and students are expected to have passed through a systematic training in Physics, or one of the branches of Engineering, preferably mechanical, including a fairly high standard in Mathematics. They should have graduated A.R.C.S. or B.Sc., or have attained a recognised equivalent standard.

A complete course of lectures and laboratory work is given each year. There are two main branches—aerodynamics, design and construction, or aero-engines, but times are arranged so that all the lectures can be attended.

THE AVRO FIVE.—A three-quarter front view of the four-seat, three-engined cabin monoplane which made its first appearance at the Aero Show. This machine has been sold to Wilson Air Lines, of Nairobi, Kenya Colony.

Schneider Trophy

Great British Triumph

On September 7th 1929, Flying-Officer Waghorn flying a Supermarine Rolls-Royce S6 Seaplane over a 350-kilometre course, averaged 328·63 miles per hour, thus retaining the Schneider Trophy for Great Britain.

On September 10th 1929, Squadron-Leader Orlebar, A.F.C., also flying a Supermarine Rolls-Royce Seaplane reached the astounding speed of 368 miles per hour over the 3-kilometre speed course. This is the fastest speed ever attained by any aircraft of any nation.

For Speed and Reliability

ROLLS-ROYCE

Engines are the Best in the World

Digitized by Google

For students desiring to undertake research in aeronautics facilities and personal supervision are available during a second year.

The following is a syllabus of the course:—

I.—DESIGN AND ENGINEERING.

(1) AERODYNAMICS—BY PROFESSOR BAIRSTOW.

(a) Lectures will be given twice weekly, and Wind Channel experiments once weekly

The Lectures will include:—Fluid motion theory and experiment. Steady motion of aircraft; elementary treatment. General treatment of design data. Airscrew theory. Prediction of aircraft performance. Stability and control.

The aerodynamics laboratory is equipped with a wind tunnel, 4 ft. by 5 ft., in which velocities up to 75 ft. per sec. can be reached and accurately measured. The forces on aerofoils and aeroplane parts are found by means of special balances. There is also a water tank for the visual and photographic study of fluid motion.

(b) MATHEMATICS FOR STUDENTS OF AERODYNAMICS. Lectures to be arranged in conjunction with the Department of Mathematics.

(2) DESIGN LECTURES.

Followed by a class, twice weekly, by Assistant Professor HILL, with Drawing Office work under Professor BAIRSTOW and Assistant Professor HILL at times to be arranged.

The Lectures and Drawing Office work in Aircraft Design will be conducted as far as possible on a system such as is used in a present-day aeroplane designer's office. A typical machine will be divided up into a number of components, and the design of individual parts making up those components discussed from the point of view of the use of particular materials, structural strength, ease of manufacture, interchangeability of spare parts, etc. The design of suitable jigs for the manufacture of such fittings will also be dealt with.

The mechanical detail of various types of modern aeroplanes will be examined and the particular points in each designer's specialities discussed.

(3) MATERIALS OF AIRCRAFT CONSTRUCTION.

Lectures, with class work, by Assistant Professor HILL, once a week.

The Lectures include:—

Consideration of the materials used in aircraft construction from the designer's and constructor's point of view. Steels, steel tubes, streamline wires and swaged rods, steel wire ropes and cables; aluminium and its alloys; copper and tin alloys; timber and glue; rubber; fabric and other coverings. Mechanical testing of materials necessary to investigate properties peculiar to aircraft requirements; applications of proof stress, fatigue range, Brinell, Izod, bend and reverse bend tests. Protection of materials against atmospheric and other deteriorating effects. The B.E.S.A. and D.T.D. specifications for aircraft material.

(4) CONSTRUCTION AND STRENGTH OF AIRCRAFT.

Lectures by Mr. FARREN, twice weekly, followed by class work, laboratory experiments and Drawing Office, under Mr. FARREN and Assistant Professor HILL.

The Lectures include:—The loads on an aeroplane in flight and their distribution in the structure; manœuvres and extreme conditions. Load factor and factor of safety. Materials and specification of strength. Wing structures; type; spar and strut design; fittings. Fuselages, undercarriages, and control surfaces. Redundancy in aeroplane structures. The treatment of structures in three dimensions. The relative importance of weight and head resistance in structural parts. Metal and composite construction in aircraft.

The class work includes:—Numerical examples on the lectures. The circulation of the strength of a typical aeroplane (wing structure and fuselage) in detail.

The drawing office work includes:—The design of spars, struts, etc., for the aeroplane dealt with in the class work.

(5) ENGINE DESIGN.

Lectures, twice weekly, with Laboratory Work by Dr. Moss and Mr. STERN, and Drawing Office under Assistant Professor HILL, followed by class work and Drawing Office under the Lecturers and Assistant Professor HILL.

The Lectures include:—Essential features of a heat cycle; practical limitations; the piston engine; heat and work balance; avoidable and unavoidable losses. Engine accessories; carburettor; ignition system; fuel system. The effect of altitude. Typical aircraft engines. Lines of future development; the injection engine; light alloys and their application. Torque curves of stationary and rotary engines; inertia forces; forces on connecting rod, crank pin, crank shaft, cylinder walls; torsional vibrations; balance. Properties of fuels; mixture strength; volumetric efficiency. Measurement of fuel and air; measurement of I.H.P., B.H.P., and frictional losses.

The Engine Laboratory is well equipped with modern plant and apparatus for the testing of engines and fuels, and for research work. The equipment available to College students by the courtesy of the Air Ministry includes:—

Ricardo 40 h.p. variable compression engine, Ricardo 30 h.p. cross-head supercharger engine, Benz single-cylinder aero-engine, Benz two-stage oil engine, Delco engine with Midgley bouncing pin equipment for fuel standardisation.

Reavell blower for supercharging, Roots' blower with equipment for carburettor testing under normal, altitude and supercharged conditions, centrifugal fan blower.

R.A.E. electrical indicator, optical indicators.

Boys' calorimeter for calorific value of gas, Junkers calorimeter for calorific value of gas and liquid fuels.

Electrical and other air flowmeters.

Exhaust gas analysis apparatus.

Test bed for aero-engine crank-shaft stiffness.

(6) AIRSHIPS.

A course of fifteen weekly lectures by Mr. RICHMOND, with class work and Drawing Office.

The Lectures include:—Aerostatics. The resistance of airships and the manner in which it is affected by their form. The aerodynamical forces acting on an airship in straight or curved flight and the characteristics which result. The loading of airships. Types of non-rigid and semi-rigid airships. Airship fabrics and the manufacture of envelopes and gasbags. The propulsion of airships. Stresses in non-rigid airships. General description of the hull structure of rigid airships and the methods of calculating the stresses set up therein. Generalised methods for calculating primary stresses in rigid hulls. The design of redundant frameworks. The consideration of some secondary stresses in the hull structure.

(7) AIR NAVIGATION AND AIRCRAFT INSTRUMENTS.

Ten weekly lectures and classwork on Air Navigation and Aircraft Instruments, by Mr. ROWE.

These lectures are preceded by a special course of twelve lectures on Meteorology by the Professor of Meteorology.

The lectures on Air Navigation and Aircraft Instruments include:—

Principles of map projection: dead-reckoning navigation; radius of action from stationary and moving bases; aircraft magnetic compass design and installation; distant-reading compasses, including the earth inductor compass and the gyro compass; airspeed indicators, altimeters and drift indicators; bearing plates and course setting sights. Navigation by astronomical observations; graphical methods of reduction. Principles and methods of direction-finding by wireless telegraphy and telephony; reduction of wireless observations. Flying and landing in fog and at night; the gyro turn indicator and the gyro rudder control; landing by the leader cable sytem; methods of determining the height above ground. Principles of engine instruments. General appreciation of aircraft instrument design.

(8) MATHEMATICS.

Classes in Mathematics will be arranged.

II. METEOROLOGY.

By Professor SIR GILBERT WALKER:—

(1) A course of twelve lectures in preparation for the lectures on Air Navigation, including fogs and mists; gradient winds; types of cloud; the vertical distribution of pressure; temperature and density; types of weather, including line-squalls and thunderstorms.

(2) Class work in general meteorology, twice weekly.

(3) Demonstrations in the plotting of maps from information received by wireless, thrice weekly.

(4) Demonstrations in sending up pilot balloons and working out their tracks from observations with a theodolite.

(5) Weekly lectures on dynamical meteorology and the quantitative treatment of weather processes.

(6) Class work in climatology, with special reference to Egypt and 'Iraq, thrice weekly second half-Session.

Meetings are held for the discussion of recent contributions to meteorology, on alternate Mondays at 5 p.m., at the Meteorological Office, by kind permission of the Director.

Students in the Meteorological Division will be expected to have a knowledge of dynamics, and of certain branches of physics—the gaseous laws, specific heat, latent heat and the rudiments of the thermodynamics of gases, vapours and mixtures.

Courses of instruction for R.A.F. Officers detailed for special service are arranged as occasion requires.

TRAINING FOR THE AERONAUTICAL ENGINEER.

As long ago as 1909 the Northampton Engineering College, which is a part of the Northampton Polytechnic Institute, St. John Street, E.C. 1, provided a course in Aeronautical Engineering. In 1910 Mr. Handley Page was appointed to the Staff and designed the wind tunnel which the College constructed in 1911. This tunnel was of the open chamber type, similar to that used by Eiffel in his famous experiments and still used by the French,—as those who went to M. Lapresle's lecture will remember.

The wind-tunnel has been rebuilt and is now of the closed type similar to those in use by the N.P.L.

The college now provides a full-time four-year course in Aeronautical Engineering. During these four years the students spend two terms, each of approximately five months' duration, in works. This is a good scheme, for a student is thereby enabled to get a job more easily because he has actually some knowledge of works' practice, besides a head full of academic theories.

For the first two years the syllabus is the same for all engineering students. After this period the students begin to specialise in their several subjects.

The third-year course comprises an historical survey of the development of Aviation, the study of fluid motion, properties of the atmosphere and meteorology, the simpler cases of flight dynamics, the principle of dynamic similarity, stability, and simple problems in air navigation.

The fourth year course comprises the study of aerodynamics, the economics of flight, the theoretical and experimental investigation of stability, the theory and design of airscrews, the methods of calculating thrust, torque, power and efficiency, the analysis and design of airscrews, their construction, and finally special airscrew problems.

Aero-engines are dealt with in detail in the fourth year.

Aeronautical drawing and design are dealt with in conjunction with the third and fourth year lectures in aeronautics. The third year is confined to detail design, but the fourth year a complete design for a machine is worked out with special reference to metal construction.

Prospective students should be at least 16 years of age and, in order to ensure an adequate standard of preliminary education, must pass an entrance examination, held in July and September.

Students who have matriculated or passed an equivalent examination are excused this preliminary examination, the next of which will be held on Monday, Sept. 30.

Above—Westland All-metal Wapiti Fuselages under construction.

Below—Cadmium Plating and Anodic Treatment Shop.

WESTLAND AIRCRAFT

Modern Production Methods at Westland Works.

The modern factory of to-day is a very different place from the war-time factory where wooden construction was almost universal. The photographs above give an idea of two shops employed on all-metal construction at Yeovil. In the fuselage assembly shop all tubes for fuselages are cut, fitted and jig drilled, and the various members are assembled into complete units, all riveting being done by pneumatic riveters. The joints are made by means of flat fish plates with hollow rivets, a small amount of clearance being allowed between the end of the various members and the load being taken by the rivets in shear.

The second illustration shows part of the shop where all steel parts are cadmium plated and all aluminium and duralumin parts are anodically treated to protect them from rust and corrosion. Sheets, tubes, tanks and fittings can all be treated.

NEW AIRCRAFT AND AEROENGINES.

THE KEYSTONE-LOENING AIR YACHT.—A six-seat cabin amphibian developed from the standard military amphibian.

THE KEYSTONE-LOENING AIR YACHT.

In October, 1928, the Loening Company was acquired by and merged with the Keystone Aircraft Corporation. The Loening organisation is however being operated as an independent division of the Keystone Company.

The first product of the new alliance is the Keystone-Loening Amphibian Air Yacht fitted with the 525 h.p. Wright Cyclone engine. This machine is a commercial development of the military type amphibians which have been supplied to the U.S. Navy and Army Air Services in recent years.

TYPE.—Six-seat cabin amphibian.

WINGS.—Two-bay biplane of equal span. Leoning 10A section aerofoil. Centre-section supported by six steel struts and wire-braced. Two sets of "N" struts on each side of fuselage. Wings built up of two solid spruce rectangular section spars and Alclad ribs, the whole fabric covered. Wings are wired for navigation lights. Ailerons fitted to lower plane only.

FUSELAGE.—The hull is of typical Loening design with a deep fuselage built onto one large central float which extends well forward of the airscrew. Construction is composite with wood members, metal fittings and a duralumin skin. The structure is assembled with bolts instead of rivets. The longitudinals are Warren girders of spruce with transverse bulkheads dividing the hull into water-tight compartments.

TAIL UNIT.—Normal type with adjustable tailplane. Unbalanced elevator in two pieces and horn-balanced rudder. Composite construction. Horizontal surfaces fabric covered. Duralumin covering on vertical surfaces. Strut bracing to lower side of tailplane.

UNDERCARRIAGE.—Lateral stability on the water is provided by small wing-tip floats. On land a retractable undercarriage of standard Loening type is used. The wheels fold up and inwards into pockets on top of the hull. The mechanism is operated by a crank close to the pilot. Time of operation either up or down 15 secs. Oleo shock absorbers fitted.

POWER PLANT.—One 525 h.p. Wright Cyclone nine-cylinder air-cooled radial mounted on extension of fuselage which is supported by two vertical struts to centre float. Fuel capacity 140 U.S. galls. (117 galls. = 530 litres). Oil capacity 10 U.S. galls. (9 galls. = 38 litres). Eclipse electric started fitted as standard. Venturi-type silencers mounted over centre-section.

ACCOMMODATION.—Double side-by-side pilot's cockpit under centre-section with central engine controls and two wheel control columns. Behind pilot's cockpit is passenger cabin, the dimensions of which are 10 ft. × 4 ft. × 5 ft. 6 in. high (3.048m. × 1.219 m. × 1.676 m.). Two doors one on each side of cabin and a third communicating with cockpits. One seat for two people right across fore wall of cabin facing aft. Two swivelling bucket seats in the centre and two bucket seats at the back facing forward. Non-splintering glass windows right along each side of cabin which can be opened and shut. Lavatory accommodation can be provided.

DIMENSIONS.—Span 46 ft. 8 in. (14.22 m.), Chord 6 ft. (1.829 m.), Length 34 ft. 8½ in. (10.57 m.), Height on wheels 13 ft. 2 in. (4.013 m.), Wing area 517 sq. ft. (48 sq. m.).

WEIGHTS AND LOADINGS.—Weight empty 3,900 lbs. (1,791 kgs.), Pay load 1,100 lbs. (500 kgs.), Disposable load 1,950 lbs. (885 kgs.), Full load 5,900 lbs. (2,676 kgs.), Wing loading 11.4 lbs./sq. ft. (55.6 kgs./sq. m.), Power loading 11.25 lbs./sq. ft. (5.1 kgs./h.p.).

PERFORMANCE.—Maximum speed 130 m.p.h. (209 kms.p.h.), 105 m.p.h. (169 km.p.h.), Landing speed 55 m.p.h. (88.5 km.p.h.), Ceiling 15,000 ft. (4,570 m.), Range 550 miles (885 km.).

THE CIVILIAN COUPE.

The Civilian Aircraft Co., of Burton-on-Trent, is one of the latest constructing companies to be formed in this country. Its first product is a small two-seat Coupé monoplane with the 75/85 h.p. A.B.C. Hornet four-cylinder air-cooled horizontally-opposed engine. The machine has many desirable features, including push-and-pull-rod controls all mounted on ball-bearings, windows all round the cabin, including the back, giving a clear view between the wing and the fuselage, and a large door on each side of the cabin allowing either occupant similar ease of access to their seats.

THE CIVILIAN COUPE.—A side view of the first product of the Civilian Aircraft Co. of Burton-on-Trent. The machine has an A.B.C. Hornet (flat opposed 4-cyl.) engine. —(*"Aeroplane" photograph.*)

Digitized by Google

TYPE.—Single-engined high-wing cabin monoplane.

WINGS.—Braced monoplane of wooden construction. Wing structure consists of two box spars of spruce and plywood, and a number of main ribs of similar construction. In between these ribs are located a number of intermediate former ribs. The whole wing is covered with plywood. The wings are carried above the upper fuselage longerons, the intervening space between the wing and fuselage being filled with windows. One pair of Vee bracing struts on either side of the fuselage. The wings fold round the rear spar joints and the apices of the bracing Vees. The locking pins on the front spar joints have a double safety catch.

FUSELAGE.—Rectangular structure of spruce longerons and stiffening struts with plywood covering.

TAIL-UNIT.—Monoplane type. Construction similar to that of the wings. The extremity of the fuselage, including the tail-plane, fin, rudder, and tail-skid are built up as a complete unit and bolted to the fuselage by four bolts. All tail surfaces are cantilever.

UNDERCARRIAGE.—Divided type. Each unit consists of a telescopic leg attached high up the side of the fuselage, the bottom end being hinged to the bottom fuselage longeron by a steel tube Vee. All joints to the fuselage are by ball-joints enclosed in grease-proof leather stockings. Springing is by rubber-blocks in compression. A laminated leaf-sprung tail-skid is used.

POWER PLANT.—One 75/85 h.p. A.B.C. Hornet four-cylinder horizontally opposed air-cooled engine. The engine mounting is a steel tube unit which carries the engine, engine controls, and dashboard, with all necessary instruments. The main fuel tank of 16 gals. capacity is in the right-hand wing root giving gravity feed to the engine. Petroflex tubing at the rear spar hinge allows the wing to fold without disconnecting the fuel pipes.

ACCOMMODATION.—Side-by-side seating in totally enclosed cabin. Windows all round upper half of cabin. Two doors, one on either side. Dual control and wheel brakes will be fitted. A luggage locker is located behind the cabin with an outside door on the left side of the fuselage.

DIMENSIONS.—Span 35 ft. 6 in. (10.8 m.), Length 19 ft. 2 in. (5.8 m.), Width folded 11 ft. 2 in. (3.4 m.), Length folded 23 ft. (7.0 m.).

WEIGHT.—Weight loaded (normal C. of A.) 1,500 lb. (680.4 kgs.), weight loaded (aerobatic C. of A.) 1,300 lb. (589.7 kgs.).

PERFORMANCE (estimated).—Speed max. 100 m.p.h. (160.9 km.p.h.), cruising speed 83 m.p.h. (133.6 km.p.h.), stalling speed 40 m.p.h. (64.4 km.p.h.), Climb to 5,000 ft. (1,524 m.) 10 mins., Climb to 10,000 ft. (3,048 m.), 25 mins., Service ceiling 12,000 ft. (3,660 m.).

THE 100-110 H.P. ARMSTRONG SIDDELEY GENET MAJOR ENGINE.

The Genet Major is the latest addition to the well-known range of Armstrong Siddeley air-cooled radial engines. Being rated at 100 h.p. it occupies a position midway between the 80 h.p. Genet and the 150 h.p. Mongoose. It made its first appearance at the 1929 Aero Show at Olympia, where its clean design and sturdy appearance created a most favourable impression. The engine is particularly suitable for the more elaborate type of light aircraft and also for powering three-engined machines of the 4 to 6 seater type.

SPECIFICATION.

TYPE.—Five-cylinder radial air-cooled engine with the vertical cylinder at the bottom.

CYLINDERS.—4.25 in. by 4.5 in. bore and stroke. Each cylinder machined with its fins from a steel forging, the lower end being screwed into a steel adapter and located in the aluminium crankcase and locked there with a double cone locking ring and screw. This method of attachment is very quickly undone and also distributes the pressure of the explosion over a large area of the crankcase. The aluminium alloy semi-spherical heads are shrunk, screwed and locked into the cylinders, an external fin providing additional security. This patented method of attaching the head to the barrel ensures a gastight joint and good thermal contact and is standard on all Armstrong Siddeley engines. The bronze bushes for the sparking plugs and valve seats are screwed and shrunk into the head.

VALVE GEAR.—Two inclined valves per cylinder. The inlet valves are of stainless steel and the exhaust valves are made of cobalt chrome steel. The valves are, therefore, not interchangeable. They are returned to their seats by duplex valve springs which enable a spring of small rate to be accommodated in a small space. Each valve is operated by a rocker arm, the necessary means of adjustment for clearance being provided on the arm and locked by a transverse screw, which it is very important to keep tight. The rocker arm is carried on two rows of ball bearings, shims being fitted to take up side-play. These bearings are lubricated by a grease-gun, the arm itself being enclosed in a light pressed case fitted with a spring-on streamlined lid. The rockers are carried on brackets taking their support from the lower part of the cylinder-head and connected by cross pieces which also form guides for the cables. The lower halves of the rocker covers form a support for the bracket and are attached to the head at a point adjacent to the valve ports which are situated at the back of the head. The rocker arms are operated by tubular push-rods which are fitted with case-hardened ends sweated into position. The lower end is ball shaped, and the top end is flat. Screwed into the rocker-arm there is a bush with a loose pad formed of two cylindrical surfaces at right angles to each other, which by providing a universal motion and line contact at this point eliminates wear.

The push-rods are controlled by roller ended tappets and a slow speed cam ring driven at a sixth engine speed from the crankshaft through the medium of two satellite wheels. The inlet and exhaust cams are set parallel on the cam ring, which revolves in the same direction as the crankshaft.

The 100 h.p. Armstrong Siddeley Genet-Major engine.

CRANKCASE.—The crankcase is very substantial and is well-ribbed. It accommodates the mouths for the cylinders and tappet guides and the wall carrying the front main bearing. Its rear face is open and is sealed by the mixing chamber. The latter incorporates ports for accommodating the lower ends of the inlet pipes and the housing for the rear main bearing. The magneto timing-case is located behind the induction chamber, the housing for the ordinary type of worm gear hand-starter where this is fitted being bolted up to the magneto timing-case. The front cover incorporates the faces for the attachment of the oil pump and breather. The breather is mounted on the front cover and consists of a non-return valve, baffles and a vapour passage packed with aluminium shavings which separate the oil from the vapour and allow the former to return to the crankcase.

CRANKSHAFT.—The crankshaft, which is short and stiff, is carried on two roller bearings, the front one being fitted in the crankcase and the rear one in the rear cover, these bearings being situated fore and aft of the webs of the crank. A third dual-purpose bearing is fitted in the front cover to take the thrust of the airscrew. Housings for the two roller bearings are shrunk and locked with nut lugs. Steel balance weights are bolted and rivetted to the crank, thus following Armstrong Siddeley practice.

CONNECTING RODS.—The master-rod and one half of the master ring are formed in one steel forging machined all over. To this rod are attached two of the auxiliary rods which, like the master rod are of "H" section. The cap half of this rod carries two more auxiliary rods. A split flanged steel bush lined inside with white metal constitutes the crankpin bearing and is pegged securely in position. The case-hardened steel wrist pins are located in the master ring by the four master-rod bolts securing the master-rod to the cap half. The lower end of the connecting rods run on fully-floating bronze bushes. The hollow gudgeon pins at their upper ends are similarly equipped and prevented from lateral movement in the "Y" alloy pistons by means of circlips which expand into the piston bosses.

CARBURATION.—One Claudel Hobson A.V.48 carburetter mounted at the rear of the engine. The mixture passes into an annular chamber formed by the rear cover where a fan driven direct from the crankshaft distributes it equally to all five cylinders. The carburetter is fitted with interconnected altitude and throttle controls and is designed to have its parts easily accessible.

IGNITION.—Two B.T.H. G.L.5 magnetos, one being fitted with an impulse-starter. There is a splined coupling between the rear end of the crankshaft and the front end of the rear drive shaft which is housed in the rear cover. A gland is fitted to prevent oil from reaching the rear drive chamber and there is a spiral on the magneto coupling to return oil that works its way past the bearing. The rear drive shaft carries a centre gear wheel which incorporates hand starting dogs. This wheel drives two other gears at 1½ speed, these gears being provided with a fine adjustment coupling for synchronising the timing. There is an oil plug at the top of the timing cover and oil should be filled up until it reaches the level of the drain tap. The centre gear wheel is mounted on a single ball race while the outer gear wheels are fitted with two races each. The magnetos are flange-fitted to the timing case, their contact-breaker ends facing rearwards.

LUBRICATION.—The lubrication system is of the dry-sump type, the pump unit, which is mounted on the front cover in a very accessible position, incorporating the pressure and scavenge pumps which are driven by bevel gearing from the crankshaft. The scavenge pump is of 50% greater capacity than the pressure pump. The suction pump draws the oil from a sump in the crankcase on each side of the bottom cylinder and passes it through a cylindrical filter in the pump itself. The oil then reaches the tank, from which it travels to the pressure pump, through a multiple disc fine gauze filter and then through the centre of the pump driving-spindle and through a hole into the centre of the crank and so to the crankpin. To prevent too great a pressure being built up a release valve is incorporated in the system. The tachometer drive is by worm gear from the pump shaft.

A petrol primer is fitted and connected to a ring pipe on the

"CANNOT FIND ENOUGH TO CALL FOR A COMPLETE OVERHAUL IN 300 HOURS"

MR. C. HUMPHREY

Ground Engineer to London Aeroplane Club, says

"Since we took delivery of our two Gipsy Moths they have both completed 300 hours running on one top overhaul, in which the only replacements were scraper rings in each case.

On reading your handbook of maintenance schedules for this engine one reads that the engine should be completely overhauled after 300 hours; this does not do justice to your engine for one cannot find enough to call for a complete overhaul.

As a licenced ground engineer, I would have no hesitation in sanctioning a top overhaul every 150 hours and a complete overhaul at 450 hours."

SEALED GIPSY TOUR
600 HOURS UNTOUCHED

This remarkable tour has no parallel in the history of aviation. Since December 29th, 1928, when the test was started, a standard Gipsy engine has flown 51,000 miles and has been treated with complete neglect—attention being confined to the routine cleaning of filters and sparking plugs, the checking of valve clearances and the correction of a minor defect in one magneto.

GIPSY

100 H.P. LIGHT AERO ENGINE

Digitized by Google

rear of the engine. Pipes lead from this ring to the induction ports of each cylinder. When the pump is operated by hand, atomised petrol is fed into the ports.

Dimensions.—Diameter 38 in. (.965 m.), Length over airscrew boss 36.15 in. (.918 m.).

Pistons.—The pistons have flat tops and are machined all over. There are two pressure and one scraper ring above the gudgeon pin and one scraper ring below it.

Weight.—(Complete with 2 magnetos, carburetter, air intake, airscrew hub and tachometer drive) 250 lbs. (114 kgs.), Weight per rated h.p. 2.27 lbs. (1.03 kgs.).

Performance.—Rated b.h.p. 100, Actual normal b.h.p. at sea level 103, Fuel consumption 0.575 pts. per b.h.p./hr. (.327 litres per b.h.p./hr.), oil consumption 2 pts per hour (1.14 litres per hr.), Compression ratio 5.2 : 1, Oil pressure 60-80 lbs. per sq. in. (4.2-5.6 kgs. per sq. cm.).

THE B.M.W.-X.

The B.M.W.-X represents the first attempt on the part of the Bayerische Motoren Werke of Munich to produce an engine suitable for light aircraft.

Type.—Five-cylinder geared air-cooled radial.

Cylinders.—Bore 83 mm., stroke 80 mm., steel cylinders with aluminium heads screwed on and shrunk and inserted valve seats of aluminium bronze. Rocker boxes integral with cylinder head casting.

Valve Gear.—Cam drum in the engine nose, tappets, push rods, rocker arms, fully enclosed.

Auxiliaries.—All auxiliaries at the rear of the engine. Magnetos below engine centre line on transverse shaft. Oil pumps on vertical shaft on base of the auxiliary drive case. Hand turning gear at the rear of the engine, to be cranked from the cockpit.

Carburettor.—B.W.M. design, vertical type.

Distribution.—By centrifugal blower, driven by means of spur gears and maximum torque clutch from crankshaft rear end.

Reduction Gear.—B.M.W.-Farman type, ratio 2 : 1.

Weight Dry.—80 kg. (177 lbs.).

Performance.—(6.3 compressed ratio): Maximum output 65 b.h.p. at 3,000 r.p.m. Normal output 60 b.h.p. at 2,900 r.p.m. Fuel consumption 0.235 kg. (0.52 lb.) per h.p./hour.

The 65 h.p. B.M.W.-X geared radial engine.

B.M.W.-XI.

This is the nine-cylinder version of the B.M.W.-X engine. A great number of parts of the B.M.W.-X is identical with the respective parts of the B.M.W.-X.

Weight Dry.—105 kg. (233 lbs.).

Performance.—(6.3 compression ratio): Maximum output 120 b.h.p. at 3,000 r.p.m., Normal output 100 b.h.p. at 2,830 r.p.m., Fuel consumption 0.235 kg. (0.52 lb. per h.p./hour).

A REAL BALLOON TYRE.

The following comes from the U.S.A.:—

Development of the Goodyear Air Wheel, Musselman type, increasing the safety factor in airplane landings and take-offs is announced by The Goodyear Tyre and Rubber Company. The new tyre is revolutionary in design, a full balloon cover mounted directly on a hub attached to the plane undercarriage, eliminating rim, spoke and wheel. The name is appropriate inasmuch as the cover has the dual function of a tyre and wheel.

Goodyear, pioneer builder of aircraft tyre and accessory equipment, sees in the Air Wheel an opportunity to make costly auxiliary shock absorbers unnecessary, thus adding to the useful load-carrying possibilities of heavier-than-air ships.

Other outstanding advantages claimed for this new type of tyre include extreme cushioning for landings; traction in snow, ice, sand and mud; nearness to perfect streamline; elimination of ordinary ground looping; the greater security in cross-wind and deflated-tyre landings.

The Air Wheel gives larger air volume at extremely low pressure. Extended experiments and tests show it to be capable of sustaining huge loads under ordinary service conditions.

The cover is mounted upon a specially designed hub, furnished

Two views of the Goodyear Air Wheel.

with or without an internal expanding brake, similar to well known standard types. Smooth and efficient braking has been attained in tests, aviation engineers having stressed the desirability of quick automatic action.

Goodyear engineers report the brake tests to date give promise of revolutionary results for airplane use.

Planes have been landed without any perceptible jar or jolt on the new air wheel; test pilots reporting that landings were so soft that it was impossible to tell when the actual contact with the earth took place.

Engineers further point out that such landing cushioning should lengthen the life of the airplane, sparing the framework from straining and wrenching.

Goodyear engineers explain that the secret of anti-bouncing and absorption of shocks in the Air Wheel type of tyre lies in the low pressure and large air volume. The shocks are dissipated in the greater air volume attained in the cover.

The huge sectional diameter of the Air Wheel as compared to its height, produces a flat or web-foot effect when landing, making it possible for a plane to make contact safely on soft ground, snow and rough surfaces where high pressure tyres might cause a crash.

Elimination of the regular wheel takes from the airplane one more element of danger—collapsing wheels. Further safety is claimed for the Musselman Air Wheel inasmuch as tests prove conclusively that the straight sidebeads with steel wire rings prevent the cover from climbing the hub flange.

Planes mounted on the Air Wheel have shown a tendency to take off easier and with less power than when the ordinary high pressure tyre is used. Goodyear engineers explain that this is due to the ability of the plane to rise from two to five inches and still keep contact with the earth through the wheels. Thus it follows that obstructions on the ground or uneven spots will more readily be absorbed by the tyres themselves and not hinder progress of the plane.

Actual production of the new Air Wheel is scheduled to start in the near future, although no definite date has been set.

Everywhere leading airplane manufacturers, pilots and aviation experts are taking a keen interest in the announcement of this revolutionary tyre.

THE CLEVELAND AERO SHOW.

Concurrently with the National Air Races there was held in the Cleveland Public Auditorium a National Aeronautic Exposition (Aug. 24 to Sept. 2).

Thirty-eight aircraft manufacturers exhibited a total of fifty-six commercial aircraft. These may be analysed as follows:—

Landplanes, 51; seaplanes, 3; amphibians, 2.
Cabin aircraft, 25; open cockpit aircraft, 31.
Single-engined, 49; twin-engined, 2; three-engined, 5.

Aircraft with radial air-cooled engines, 51; aircraft with vertical in-line air-cooled engines, 5.

The exhibition was the first at which the Curtiss OX-5 engine was not represented, and it was also remarkable for the fact that every aircraft was equipped with air-cooled engines. Of the thirty-one aero-engines shown, only one, the Curtiss Conqueror, was water-cooled.

Of aeroplanes of British design, the Moth Aircraft Corporation showed a Gipsy-Moth and the Whittelsey Aircraft Corporation an Avian. Of engines of British design, the American Cirrus was the best represented. Four aircraft, the Avian, the Great Lakes 2T-1, and the 4A-1, the latter a twin-engined amphibian flying-boat, and the Emsco monoplane, all had Cirrus engines. The Moth had a Wright Gipsy engine. On engine stands the American Cirrus, the Wright Gipsy, and the Bliss Jupiter were exhibited.

Nothing of revolutionary design was shown. The most interesting features were in the nature of refinements in design. N.A.C.A. low-drag cowling and streamline fairings for landing wheels, were two of the most notable features tending towards increase in speed. With regard to the low-drag cowling, one American firm, the Hill Auto Body Company, has already begun the manufacture of standardised sizes for American radial engines.

The most interesting new types were the type 107 Mail Transport sesquiplane, built by the General Airplanes Corporation of Buffalo, N.Y., the Great Lakes 4A-1 amphibian, built by the Great Lakes Aircraft Corporation of Cleveland, Ohio, the Emsco light monoplane, built by the Emsco Aircraft Corporation of Downey, Cal., the Travel Air "Mystery" monoplane, and the McCarroll twin-engined amphibian, built by the Cadillac Aircraft Corporation, Dearborn, Mich.

The type 107 Mailplane, built by the General Airplanes Corporation, was designed on the tabulated results of a *questionnaire* sent to a large number of air mail operators.

It is a sesquiplane with a rivetted aluminium alloy monocoque fuselage, wings built up of spruce spars, metal ribs, and fabric-covered, and a geared Pratt and Whitney Wasp engine. The engine is enclosed in an N.A.C.A. cowling which has an oil-tank and exhaust collector ring built in. On an empty weight of 3,152lb. it has a pay-load capacity of 2,000lb. and a normal loaded weight of 6,250lb.

The Great Lakes 4A-1 is a four-seat cabin amphibian flying-boat with two American Cirrus engines mounted midway between the equal-span biplane wings. The engines are very neatly cowled-in and drive tractor airscrews. The hull is of the two-step type, reminiscent of that used on the old Vickers Viking, but it is of all-metal construction. The framework and covering of the hull is aluminium alloy. The landing-gear, which disappears into a recess in the side of the hull, is operated by cables. There are two side-by-side seats in front of the wings and a passageway between the wheel recesses leads to two more seats aft of the wings. The wings are of the single-bay type, with one set of "N" struts on either side of the engines. Its empty weight is 1,900 lb., and the loaded weight is 3,200lb.

The Emsco light monoplane is of what is known in America as a wire-braced "centre-wing" monoplane—that is, the wing is placed on the thrust line of the engine. This machine is copiously streamlined. The Cirrus engine is cowled in and the cowling is carried right aft to the fin. The wings are streamlined with the fuselage, and the fairing provides space for two 15-gallon fuel tanks. The wheels are almost completely enclosed in streamline casings. It has an empty weight of 1,090lb., a loaded weight of 1,640lb., a maximum speed of 130 m.p.h., and a cruising speed of 100 m.p.h.

The Travel Air "Mystery" monoplane was, unfortunately, not ready in time for the exhibition. Two examples were, however, present at the National Air Races held concurrently with the Show, one with a Wright J-6 radial engine and N.A.C.A. cowling, and one with the new six-cylinder-in-line air-cooled inverted Chevrolair engine.

The McCarroll amphibian is a cantilever monoplane flying-boat with two 165 h.p. Wright J-6 five-cylinder air-cooled radial engines, faired with the top surface of the wing, driving tractor airscrews. The single-step hull has a wood framework with a covering of aluminium sheet rivetted on. The two units of the landing gear are hinged to the sides of the hull, and are raised by drum and cable mechanism operated from the pilot's cockpit. The empty weight is 2,975lb. and the loaded weight is 4,100lb.

Among the new engines the Curtiss Crusader was by far the most interesting. This is a six-cylinder inverted air-cooled engine developing 120 h.p. at 1,800 r.p.m. Each cylinder is made up of a forged steel sleeve machined all over and screwed, with an aluminium head shrunk onto it. The head has integral cooling fins and one inlet and one exhaust valve. The cylinders are attached to the crankcase by clamps instead of the usual holding-down studs.

An "underhead" camshaft of the automobile type is driven by a vertical shaft through bevel gearing at the rear end of the engine. The bore and stroke of the cylinders are 4⅛in. by 5½in.

A dry sump system of lubrication is used, and when the engine is in operation, the pistons are continually throwing oil upward into the crankcase. The pistons have two compression and three scraper rings. For cooling, an air-scoop on the exhaust side of the engine deflects air onto the cylinders.

The overall length of the engine is 4ft. 8 13/16in., and the overall height is 2ft. 8 49/64in. The weight is 345lb.

Another interesting engine was the Dayton Grant, an eight-cylinder air-cooled "flat" engine, built by the Dayton Airplane Engine Co., of Dayton, Ohio, which company already makes a four-cylinder in-line air-cooled engine known as the Dayton Bear. The new engine has two banks of four cylinders set at an angle of 180 degrees, and develops 225 h.p.

Two super-chargers for commercial use were shown. One, of the Roots type, was on the American Cirrus stand, and has been designed for use with the American Cirrus engine.

The other, of the turbo or Rateau type, was shown by the General Electric Company, and can be supplied for use with various standard type engines.

The proportion of accessory exhibits was larger than at any previous exhibition of importance. The Goodyear "Air Wheel," which is a species of overgrown balloon tyre mounted direct onto the axle, the range of Eclipse inertia starters, which now includes one for light engines of approximately 100 h.p., a variable and reversible pitch airscrew exhibited by Paragon Engineers, Inc., airscrews in wood, micarta, and metal by various manufacturers, standardised seaplane floats by the Edo Aircraft Corporation, to mention but a few, represent but a small proportion of the accessories shown. Also there were striking exhibits of Air Port equipment and machine tools.

STILL THEY COME.

Negotiations are proceeding under the auspices of prominent U.S. banking interests for the merging of yet more aircraft manufacturing and aviation concerns of international repute. One British, one American, and two French companies with combined assets of over £1,400,000 are involved in the latest deal.

Mr. A. J. Love, a member of the banking firm of Love, Bryan and Company, of New York and St. Louis, who has been prominently associated with the negotiations, is chairman of Allied Aviation Industries and a director of the Fokker Aircraft Company and a number of other leading U.S. industrial corporations. He has been in Europe for several months, studying industrial conditions, and particularly the position of leading aviation companies.

In an interview recently he said:—"One of the most powerful influences for the prevention of war is the rapid progress now being made in international industrial consolidations, and the exchange of capital stock between the World Powers. War is really militant commercialism. Internationalise commercial and industrial interests and peace will be on a surer foundation."

THE AIRCRAFT OPERATING COMPANY.

The directors of the Messina Copper Mine in the Northern Transvaal have arranged for the Aircraft Operating Company, Ltd., to photograph the mine for the purpose of illustrating their annual report.

Perhaps this marks the beginning of an era when no mining directors' report will be complete without aerial photographs, which would be a fine thing for such concerns as the Aircraft Operating Company, who have pioneered air survey work right round the world.

MORE PEACEFUL PENETRATION.

A company known as the Bellanca Aircraft of Canada Ltd. has been appointed the Canadian distributors for the American Bellanca Aircraft Corporation.

This company has offices at 4221, St. Catherine Street, W. Montreal, and it has taken delivery of a Bellanca seaplane (300 h.p. Wright J-6 engine) of the latest type for demonstration purposes.

The business manager of the Bellanca Co. in the States is Mr. Robert Noorduyn, late of the Fokker Co., and before that of the B.A.T. Co., with Sir Samuel (now Lord) Waring.

THE LIGHT AEROPLANE AND THE FLYING CLUBS.

A ROYAL MOTH.

H.R.H. the Prince of Wales has bought a D.H. Gipsy-Moth for his private use. This machine, whose registration marking is G-AALG, is upholstered in scarlet leather and is painted in the red and blue colours of the Household Brigade Flying Club.

So that H.R.H. may fly to and from his new residence at Fort Belvedere in Windsor Great Park a landing ground has been prepared at Canadian Camp.

Canadian Camp is close to Virginia Water and was originally known as Smith's Lawn. The name was changed, at the request of H.M. the King, out of compliment to a detachment of the Canadian Forestry Corps, who were encamped there during the War.

THE HALDON AIR RALLYE.

For sheer cussedness the English weather takes some beating. Encouraged by the long spell of fine weather the small band of air enthusiasts at the Haldon School of Flying, Teignmouth, Devon, arranged an air rallye for Saturday last.

The meeting was widely advertised throughout the county, and at Teignmouth one found it the topic of the day. All the local charabanc concerns were running special services to the aerodrome, and there seemed every prospect of a highly successful meeting.

On arrival at the aerodrome, which is situated high up on the moors, one found half a gale blowing, which increased in velocity as the day advanced. Fortunately this fact was not known in the surrounding towns, and there was quite a good attendance. Admission to the aerodrome was free, but the local Red Cross Society reaped a good harvest by a collection.

Doubt was expressed as to whether any visiting aircraft would brave the elements, but punctually at zero hour, 12.30 hours, three machines were sighted. The first to land was a Westland Four, EBXX, piloted by Mr. Louis Paget. Next came the familiar Moth, EDCA, piloted by Mr. Norman Brooks, who brought, as the registration letters indicate, our *E*nergetic *D*irector of *C*ivil *A*viation, Sir Sefton Brancker. The third machine was Mr. Penrose's Widgeon, JF.

Between 13.30 and 14.40 hours quite a lot of things happened. First there was a procession of Gipsy Moths, which arrived, KJ, flown by Flt. Lt. Rose, of the Anglo Co., IM, flown by Mr. Shaw of the Shell Mex Organisation, and Mr. Jackaman in DX. Following these came Mr. Clarke in the Junkers F.13 from Croydon.

Then came calamity. The microphone informed us that the Auto Giro was in sight. This news was received with the greatest interest, and we all watched the machine approaching. She came in to land in fine style, and seemed thoroughly stable after the buffetings which the other machines suffered. When about twenty feet from the ground, Mr. Rawson, the pilot, lost his engine, and the machine hovered and might have made a good landing had it not been caught by a gust of wind which turned it right over. The pilot escaped without injury, but the machine was completely wrecked.

It was the worst piece of bad luck. Had the engine been running the rotors could have been accelerated, and a safe landing made.

Soon after this we were informed that Flt. Lt. Le Poer Trench had forced-landed in his Hermes Avian near Lyme Regis. It seemed, as if Fate had turned against aviation, but he arrived at 14.30. His forced landing was due to his having run out of petrol.

By this time the gale was at its height, and as each machine landed it was quickly picketed down. It was obvious that the very excellent programme could not be fulfilled. However the crowd was in a good humour and was intensely interested in the machines, which were closely inspected.

Dust was blowing across the aerodrome in clouds, and an enterprising person could have earned a small fortune by selling goggles. Everyone who possessed them was wearing them to the envy of those without.

At 15.15 hours the Westland Four returned to Yeovil, and shortly after a Southampton Flying-Boat from Mount Batten cruised around the aerodrome.

The wind kindly consented to throttle down, and so Mr. Norman Brooks and Flt. Lt. Rose went up in Moths, and gave a demonstration of aerobatics. This was a real "Mother's" meeting, there being no less than 14 on the aerodrome. Lady Bailey and Mr. Hubert Broad flew over and joined the family, the latter giving a very fine show of aerobatics which earned a storm of applause when he landed. His flick and slow rolls and inverted flying were a very praiseworthy performance considering the weather upstairs.

Flight-Lieut. Scroggs later joined the party of very sporting pilots who defied the elements in his D.H.53. Further flying was then abandoned.

The organisers of the meeting, headed by Mr. Parkhouse,

"LESS THAN THE DUST."—Mr. Broad's Moth struggling to get down in the dust-storm at Haldon.

The Vickers-Reid Control Indicator

An essential instrument for flying in conditions of poor visibility.

Captain C. D. Barnard, who in seven days with Her Grace The Duchess of Bedford, recently flew from England to India (Karachi) and back writes :—

"**The Reid Control Indicator was invaluable** - especially considering the fact that a great deal of **the journey was flown in clouds or in dust storms, it worked perfectly** and I should insist upon a 'Reid' being fitted to any machine if I were to contemplate a similar flight on it."

August 17th, 1929.

AT HALDON.—The Visiting Machines picketed down. Mr. Trost's Junkers on the right.—(*"Aeroplane" photograph.*)

deserve the fullest sympathy for the failure of the meeting after all the hard work they had put in. They had counted on the meeting giving an added interest in the School.

From an æsthetic point of view the aerodrome is ideally situated. It is on high moorland, with magnificent views all round, but the exposed position and surrounding hills do not make for ideal flying under such conditions as those of Saturday. The aerodrome is large and has a good surface, and there is ample accommodation for several machines.—M. S.

FAREWELL TO FILTON.

The farewell aerial garden party on Sunday, Sept. 22, of the Bristol and Wessex Aeroplane Club was an unqualified success. The weather was all that could be desired, and fully atoned for its misbehaviour at Teignmouth on the previous day.

This was the last meeting of the Club at Filton Aerodrome, which they have used since August 1927. A move will shortly be made to the new Municipal Aerodrome at Whitchurch, which is only a ten minutes run from Bristol. A very fine Club House is in course of erection, and will comprise a lounge, dining room, dance hall, bar, kitchen, changing rooms, etc. A flat roof is being provided from which to watch the flying, and it is hoped that tennis courts will be laid down, as well as an attractive garden.

Since its inauguration the Club has made rapid progress, and it is hoped that in its new surroundings it will forge ahead still further. Starting two years ago with one Moth, the Club now owns three Moths, a Bristol Brownie, and a Parnall Pixie, and two full-time instructors are employed. There are now over 250 members, and 50 have learned to fly.

Arriving at the aerodrome at mid-day one found an array of machines which had arrived during the morning. Many of them had flown up from the Teignmouth meeting,—including Mr. Parkhouse himself.

Among the early arrivals was Sir Sefton Brancker, in his Moth, G-EDCA; Flt. Lt. Le Poer Trench, in his Hermes Avian; Mr. Talbot Lehmann, in an N.F.S. Spartan, and several members of the Gipsy-Moth clan, including Flg. Off. P. P. Grey, with Mr. McClure as passenger; Mr. and Mrs. A. Muntz, Flt. Lt. Rose, the Hon. Lady Bailey, Mr. Hubert Broad, Mr. R. Malcolm, of De Havillands, and Mr. Jackaman.

Mr. Wheatley brought over his Golden Shell Moth, Mr. Low arrived in a Cirrus Moth, and Mr. Hanstock flew down in the Anglo Co.'s Widgeon.

At 15.00 hours Mr. E. B. W. Bartlett, the Bristol Club's chief instructor, went up in a Gipsy Moth and gave an exhibition of aerobatics. By this time quite a large crowd had assembled on all sides of the aerodrome, and cars were parked in every available space.

Event No. 2 should have been a demonstration of the Auto-Giro, but this machine having been blown over in the gale at Teignmouth it had perforce to be abandoned.

Several more machines began to arrive, the first being an Avian, EBXO, from the Hampshire Aeroplane Club. Some diversion was then caused by the arrival of the Glenny and Henderson Gadfly, piloted by Mr. O. Greig, who is the firm's agent at Okehampton.

Mr. Penrose next joined the party in his Widgeon, and was followed by Mr. Louis Paget in the Westland Four.

A Gipsy Widgeon was the next arrival, flown by Mr. Napier, followed by Mr. Wallace in a Gipsy Moth, and Mr. Nigel Norman in a Coupé Moth.

Mr. H. S. Broad then took up his Moth and treated us to one of his usual excellent displays of aerobatics.

The next event was a bombing competition for the White-

IN THE WEST COUNTRY.—The Director of Civil Aviation recently inaugurated a new Aerodrome at Roborough, five miles from Plymouth, for the newly-formed Plymouth Aero Club. The Mayor of Plymouth, Councillor Andrews, is here seen greeting Mr. W. R. Parkhouse, of Teignmouth, whose Moth was the first aeroplane to alight on the new aerodrome.

ley Challenge Cup, for which there were a large number of entries. During this event demonstration flights were given by various types of visiting aircraft.

The star turn of the display was provided by Mr. C. F. Uwins, the Bristol Aeroplane Company's test pilot, who showed us what could be done with a Bristol Bulldog. This machine bore the red Swastika markings of Latvia on its wings and fuselage.

Here followed the tea interval, after which several pilots contributed items to the programme as it took their fancy.

Altogether it was a very enjoyable and well arranged show, and a fitting finale to Filton, and one looks forward to even better things at the Club's new home.—M. S.

THE HOUSEHOLD BRIGADE FLYING CLUB.

Considering that the number of eligible prospective members is strictly limited, the Household Brigade Flying Club has been remarkably active since it settled down at the Heston Air Park with its own premises in July last.

The Club bought a Gipsy-Moth—G-AAIP—on Aug. 15, and the flying time by members from August up to the present date amounts to 60 hours,—31 hr. 45 min. Dual, and 28 hr. 15 min. Solo.

The following members qualified for their "A" Licences during this period:—Lieut. E. L. Donner (Irish Guards), Lieut. Sir Robert Throckmorton, Bt. (Grenadier Guards), The Lord Amherst (late Coldstream Guards), Captain the Hon. F. E. Guest (late Life Guards).

THE NORTHAMPTONSHIRE AERO CLUB.

During August there has been a distinct improvement in the flying time of the Northampton Club. It includes the holiday period, but the aerodrome was also shut down for one week. The week ending Aug. 31 was a record week with 25 hours.

For the whole month the figures were:—Dual Instruction, 29 hr. 15 min.; Solos, 10 hr. 15 min.; Passengers, 16 hr. 20 min.; Tests, 7 hr. 40 min. Total, 63 hr. 30 min. On which the instructor, Mr. E. F. Palmer, and the Ground Engineer, Mr. J. B. Gallagher, deserve congratulations.

During the month Mr. Eales and Mr. Bayes made their first solos, on the 13th and 18th respectively. Mr. S. P. Tyzack, who was the first member to go solo, has distinguished himself by being the first club member to perform aerobatics.

On Sept. 28 the Club will hold a week-end flying meeting, at which all other Club members and private owners are welcome. Accommodation on the Saturday night will be arranged if required, and intending visitors should communicate with the Secretary, Mr. P. Hayward, 19, Market Square, Northampton.

The meeting will include a novelty competition, which is being arranged by Mr. Broad, and a competition for private owners, for which cups are being presented by members of the Club.

THE HAMPSHIRE AEROPLANE CLUB.

The Hampshire Aeroplane Club well maintains its reputation as one of the most active flying clubs in this country. The times for the month ending Aug. 30 were:—Total time, 195 hr. 30 min.; Dual instruction, 98 hr. 25 min.; Soloists, 15 hr. 20 min.; "A" Pilots, 74 hr. 15 min.; Instructors' Solos and Passengers, 7 hr. 30 min.

Thirty-one new members joined the Club during August,—which is very good indeed.

Messrs. Angus, Vernon and Turner did the tests for their "A" Licences.

The Club much regrets to lose the services of Flt. Lt. Swoffer, who has accepted an appointment with Wilson Air Lines in Kenya. During his period as Chief Instructor at this Club, since January 1928, Club aircraft have been flown for over 2,500 hours and 46 members have qualified for "A" Licences. Flt. Lt. Swoffer was presented with a suitably inscribed silver cigarette-box by the Club.

Mr. Dudley will carry on single-handed for the Winter, but a second instructor will be wanted in the Spring of 1930.

A Gipsy Moth has now been acquired by the Club, mainly owing to the generosity of members, who subscribed a large sum towards its purchase. It has proved very popular with members, and is in consequence being worked hard.

AN AERONAUTICAL OCCASION AT MORECAMBE.

The Lancashire Aero Club gave a display on Sept. 23 at Morecambe during the local Carnival.

Lady Bailey flew her Gipsy Moth coupé up to Morecambe and was afterwards the guest of honour at a civic lunch, when the Mayor of Lancaster suggested a joint municipal aerodrome scheme for Morecambe and Lancaster.

HOMEWARD BOUND.—The Demonstration Moth, photographed near Bridgewater on the way back from the dust of Teignmouth to the fresh air of Filton.—(*"Aeroplane" photograph.*)

HANWORTH NOTES.

The results of the first two weeks at the Hanworth Club have just been issued. The routine work of instruction began immediately after the opening on Aug. 31. The only difficulty was the shortage of aircraft. Twenty or more machines would have been none too many. Of the flying members of the Club 100 have begun their course, and the ten Moths available have been kept continuously busy. In the first two weeks 17 members were sent up solo, nine of whom qualified for their "A" licences.

Altogether, 368 hours of flying were done during the first fifteen days of operation, with an average of eight machines per day.

The first *ab initio* member (Miss Sale-Barker excepted) was Dr. Petit. He is 45 years of age, and his performance is a complete refutation of the "too old to fly at 40" theory. Another member of the same age is Mr. Eggar, who is a Government Advocate in Burma, and intends to start a Burmese Flying Club on his return to the East.

Besides instructional flying, a total distance of about 4,000 miles was flown in air-taxi operations. The result is regarded as promising, for no particular effort was made to get business, as the two-passenger Desoutter cabin-monoplanes which will be used as the standard taxi-machines have not yet arrived.

A number of members are living at the Club-house and are putting in some two or three hours of flying a day. Altogether 985 meals were served in the fortnight.

The levelling and rolling of the south aerodrome is nearly complete. The Club shed and petrol station on that side are ready for service, and as soon as the levelling work is finished the south aerodrome will be used for Club flying, leaving the north aerodrome free for commercial operations.

N.F.S. AND THE NORTH.

The Yorkshire Aeroplane Club has decided at its recent annual meeting to co-operate with National Flying Services.

Lord Brotherton, who is President of the Yorkshire Club, is giving a lunch on Oct. 11 to celebrate the occasion.

N.F.S. is at present negotiating with the Leeds Corporation for the establishment of an aerodrome at Yeadon. Should this come about, N.F.S. would probably not care to have two aerodromes in the district so that the closing down of Sherburn-in-Elmet seems likely. Such an eventuality might result in the urbanisation of the club at the expense of its county interests.

A SLIGHT ARGUMENT.

The following letter, and the reply thereto, may be entertaining and informative:—

My dear C. G. G.—Conflicting feelings render my present task both difficult and unpleasant. There is, on the one hand, my regard for you as an old and trusted friend, on the other my resentment as one of your long-suffering readers, whose patience has been strained to breaking point.

In this latter capacity, I propose to attack you wholeheartedly and with no more regard for your personal feelings than you are in the habit of showing for those of your victims. In doing so I am voicing the feelings of a large number of other readers, and I therefore hope that you will publish this letter.

Your article entitled "An African Adventure" in THE AEROPLANE of last week makes, directly or by implication, the following reflections on the policy and management of National Flying Services Limited.

1. It is said that N.F.S. have not "achieved anything tangible in this country beyond the somewhat luxurious furnishings of an extra-suburban mansion and the laying-out of an aerodrome round it."

2. It is stated that "The subsidy was granted to N.F.S. distinctly on the understanding that it was for the development of aviation in Great Britain."

3. A large part of the article is based on the admittedly hypothetical assumption that the African venture will not be separately financed and will absorb part of the resources of the Company.

4. There are veiled insinuations to the effect that the proposed activities of Captain Guest and his associates amount to poaching on the preserves of others.

This is all nonsense. In the first place, besides establishing the only really attractive club for those interested in flying, N.F.S. have, during their short existence, acquired more machines, flown more hours per week, and have at present more pupils under instruction than any other flying school or club in the country. They have also established the cheapest and best equipped aeroplane hire service.

Secondly, a State subsidy is not granted on any "understanding" but on specific conditions which have to be, and, in this case, are, being complied with.

Thirdly, a simple telephone call would have enabled you to discover, had you wished to do so (as I did), that the African venture is financed and organised by Captain Guest personally. N.F.S. stand to lose nothing by its failure, but will gain greatly by its success.

Lastly, any suggestion of poaching on the preserves of others is sheer piffle, for the simple reason that there are, at the moment, no others, and no preserves. The early explorers in this field who have not so far chosen to follow up their first efforts are obviously free to do so, and, in the words of the Prophet, "Competition is good for trade."

Your statements and insinuations are thus manifestly absurd and, in fact, the whole article is a tissue of false implications. Had the article in question been an isolated case of ill-informed and biassed criticism, it would scarcely have called for comments of this nature. It forms, however, part of a settled policy of unreasoning hostility towards N.F.S. Ltd. which I and many others have noted with growing resentment.

Here we have, for the first time, an organisation which brings a really adequate supply of capital to the service of Private Flying, and which is capable of attracting the general public to aviation. Anyone who is genuinely keen on flying must see the urgent necessity for and vast potentialities of such an organisation. Yet N.F.S., which needs and deserves the support and encouragement of the whole aeronautical community, excites in you, who are supposed to be one of its spokesmen, nothing but thinly-veiled and petty antagonism.

I have too long known and respected your immense unreasonableness to hope that, by flatly refuting you, I can induce you for once to be rational. It has been obvious for many years to readers of THE AEROPLANE that you are utterly incapable of dispassionate thinking, but *can* only like or dislike excessively. As a result your THE AEROPLANE suffers from catastrophic instability; on the slightest provocation it either stalls or nose-dives.

I have, however, some faint hope of inducing you to do a little "straight flying," and thus reduce the growing volume of irritation among those of your readers to whom fair and well-informed criticism is more entertaining than personal bias and journalistic stunts. To that end, I have drawn your attention with certain emphasis to the fact that views as strong as yours, as good as yours, and diametrically opposed to yours, are occasionally held by people who do not suffer from your temperamental disabilities.

In conclusion I may point out that beyond enjoying the privilege of membership of the Hanworth Club, I have no financial interest in N.F.S.

(Signed) M. L. BRAMSON.

[The Navy itself has a saying that the three stages of a Ward Room argument are (A) Unsupported assertion (B) Flat contradiction and (C) Personal abuse. Mr. Bramson seems to have reached the third stage without the preliminaries. Which makes quite a good start, according to the well-worn legal axiom,—"When you have a weak case abuse the opposition lawyer." Having been abused equally by both sides in practically every controversy in which one has taken part, one's belief in one's impartiality remains unshaken,—though one admits to having been perhaps a shade too enthusiastic on occasion, in praise of promising but unproven ideas.

Without admitting the accuracy of the imputations in the four numbered paragraphs in Mr. Bramson's letter, one may answer those of his statements which are based on them.

Whether the mansion at Hanworth is the "only really attractive club" is purely a matter of taste. With some people congenial company counts for more than creature comforts.

The statement that N.F.S. have acquired more machines than any other club, seems likely to be true, seeing that they have had more capital to spend. And having more machines they ought to have done more flying in the same time. The true measure of efficiency would be whether they have done more flying for their capital expenditure than have a number of the other clubs whose combined capitals would add up to the same amount. This would be difficult to discover. Quite possibly the combined capital of *all* the other subsidised clubs might not equal that of N.F.S.

Another way of measuring efficiency would be to discover whether N.F.S. have done as much flying per available machine as have the other clubs.

The figures from Hanworth show 368 hrs. in 15 days with 8 machines, or less than 3 hrs. per day per machine, which is frequently beaten by many clubs.

Whether N.F.S. have the cheapest and best equipped aeroplane hire service also demands proof. The lowest price is not necessarily the cheapest. And such firms as Air Taxis Ltd., Surrey Flying Services, Northern Air Lines, and a few more unsubsidised firms might offer competitive terms and accommodation.

Mr. Bramson's "Secondly" has still to be proved. The conditions included, if one remembers rightly, the opening of a specified number of aerodromes in this country by the end of the year. We shall be able to discuss this point better on Jan. 1, 1930.

As concerns "Thirdly,"—if Mr. Bramson can bring himself to read THE AEROPLANE again he will see the phrase "Possibly this side-line, as it were, (*i.e.*, the African Adventure) may be a venture quite apart from the firm's main operations and may be separately financed."

The situation did not seem to demand "a simple telephone call." The article to which he objects was written on the strength of a communiqué from N.F.S. If the Adventure is not an activity of the firm then why did the firm issue a communiqué about it? But all the same one took care to suggest that possibly N.F.S. capital was not involved in the Adventure.

And, lastly, for Mr. Bramson's "Lastly,"—If Mr. Bramson chooses to regard the Adventure as poaching he is at liberty to do so. But personally one congratulated the directors—or should one have said "the Chairman" only?—on their shrewdness in adventuring on well-prepared ground. Less shrewd adventurers might have gone out into the blue as the Belgians did in the Congo, or the Germans in Colombia, or the Aircraft Operating Co. in Rhodesia, or the Air Survey Co. in Sarawak, or the Australians in Queensland and West Australia, where there were no aerodromes and no ready-made converts to flying. That would have shown far less commercial sense.

The World is full of poverty-stricken pioneers. The people who make money are those who follow in their foot-steps. And N.F.S. was formed, one hopes, with the idea of making money. Mr. Bramson must not let his sympathy with poor pioneers run away with his commercial acumen.

One's reason for suggesting mildly that the wisdom of N.F.S.—or perhaps of their Chairman with separate finance—might conceivably be questioned in undertaking this African Adventure was simply that N.F.S. appear to be of National importance, and that any diffusion of capital, or alternatively of energy (such as the absence of their distinguished Chairman on this Adventure) would hinder the fulfilment of their plans to make England a country fit for those who are not heroes to fly in. And that would be a National calamity far removed from a National flying service.—C. G. G.]

AN APOLOGY AND AN INDICATION.

THE AEROPLANE owes an apology to all three pilots who came over to the Leicestershire Club Meeting from Grantham on Sept. 14. The R.A.F. pilot on a Siskin who made himself a nuisance during the closing ceremony of the Meeting was not one of the three from Grantham. They had already started for home when he did his remarkably bad show.

One may add that his proceedings were not approved by experienced pilots on the Committee of the Leicester Club. No doubt the Air Ministry can discover his identity by making inquiries in the proper quarter, and discovering who, other than the approved Flight from Grantham, visited Desford in a Service Siskin.—C. G. G.

THE SCOTTISH FLYING CLUB.

The first number of *The Scottish Flyer*, the official journal of the Scottish Flying Club Ltd., has just been published. The journal is to take the place of, and to supplement, the Monthly Bulletin Letter of the Club. This issue gives an account of how the Scottish Club began and a sketch of its activities. There is an article on Engine Running and some useful hints to First Soloists and Beginners. There are also Flying sub-Committee notes and a chart of the monthly flying times since the opening of the Club. The Editor is Mr. G. F. Yuill, of 326, West George Street, Glasgow, C.2.

THE MONTREAL CLUB.

The total flying time of the Montreal Light Aeroplane Club during the month of August was approximately 134 hours. This included 48 hours' dual instruction, 18 hours' test and 64 hours' solo flights by members. The Club would like to see soloists putting in more practice.

The Airmanship Trophy Competition was held on Aug. 3. This competition is based on the Royal Air Force Cross-Country or Pin-pointing Competition, and points are given for course-finding, accuracy in dropping message-bags, and for landing. There were nine entries, but only two competitors succeeded in flying an accurate course and finding the points without loss of time.

The result was: E. W. Mellen, 76 points; M. M. Foss, 73½ points, and J. B. Forrest, 62½ points. Mr. Foss flew the best course, but had forgotten how to land by the time he got back.

Only four entries were received for the Webster Landing Trophy, but the standard was very much higher than in the last competition. The winner was S. J. Bailey.

Three cross-country flights were held during the month. On Aug. 8 two machines went to Sherbrooke and back; on Aug. 15 three machines went to Valleyfield and returned *via* the Curtiss-Reid Airport, and on Aug. 22 three machines went to Trois Rivieres and back by Granby.

On Aug. 21 Mr. R. H. Foss made an altitude test and reached 18,400 ft. in 50 minutes.

THE VOICE OF EXPERIENCE.

The De Havilland Aircraft Co. Ltd. recently received in the form of a letter the following entirely unsolicited testimonial from Mr. C. Humphreys, the ground engineer to the London Aeroplane Club:—

Since we took delivery of our two Gipsy-Moths they have both completed 300 hours' running on one top overhaul, in which the only replacements were scraper-rings in each case.

On reading your handbook on maintenance schedules for this engine one reads that the engine should be completely overhauled after 300 hours; this does not do justice to your engine for one cannot find enough to call for a complete overhaul.

As a licensed ground engineer I would have no hesitation in sanctioning a top overhaul every 150 hours, and a complete overhaul at 450 hours.

Naturally the D.H. people value his expression of opinion very highly, but, of course, the 150 and 300 hours schedules are advised in their handbook merely to cater for the careless Moth-owner who is liable to ignore the advisability of cleaning his plugs, checking his tappet clearances, etc., until these little points of routine maintenance patently require attention.

THE AUSTRALIAN AERO CLUB.

The following letter, which is of Imperial interest, has been received from Mr. J. Churchill-Smith, Secretary of the South Australian Section of The Australian Aero Club:—

Sir,—It is with great interest that we in the Southern Hemisphere read your various issues of THE AEROPLANE which are regularly received by us, and we take this opportunity of congratulating you upon reporting to a certain degree in your 1st May issue on the activities of flying in Australia.

We cannot, however, allow the occasion to pass without seriously commenting on your "Notes from Australia," where you have commenced by stating "Looking first at the N.S.W. Club" without afterwards reviewing the activities of the other Clubs except as regards certain fatal crashes experienced by them.

Later on in your "Notes" you mention the changing of the name of the N.S.W. Section, adding "the members feel that the rather nebulous bodies in some of the other States are of the nature of a hindrance to the general progress." Such a remark coming from the daily papers looking for something sensational to print could be passed over, but from a paper desirous of advancing Civil Aviation in the British Empire, such remarks are liable to mislead.

The South Australian Section of the Australian Aero Club is a very live body with a membership of nearly 450, including approximately 100 members of the Flying Section. "A" Pilots total 55, and pupils under training at the moment total 23.

In order to show the progress made, we invite your consideration of the following:—

	At 31/1/28.	At 30/11/28.	At 31/5/29.
Number of Flights ..	1,238	2,784	4,761
Dual Instruction ..	88 hr. 44 min.	245 hr. 54 min.	500 hr. 54 min.
Pupils Solo Flying ..	19 hr. 18 min.	107 hr. 57 min.	208 hr. 37 min.
Miscellaneous Solo Flying	89 hr. 47 min.	187 hr. 12 min.	389 hr. 24 min.
Pilot Members Flying ..	23 hr. 02 min.	117 hr. 24 min.	342 hr. 02 min.
Number of Passengers Carried	919	1,602	2,155
Pupils Under Instruction	14	17	22
Pilot Members	2	19	35
Number of Members ..	336	300	436
Number of Machines ..	2	2	3

We are also enclosing for your information a copy of our Club paper, "Wing Tips," which will be regularly forwarded to you in the future so that your next "Australian News" will include the brighter side of at least one other State of our great Commonwealth.

112, King William Street, Adelaide, S.A.
June 17, 1929.

[The good sportsmen of the South Australian Section must blame one of their own brethren in N.S.W. for not giving them their due. Naturally he saw most of his own Province. Meantime congratulations to S.A. on putting up such a good show. We here hope to hear more of them in the future.—C. G. G.]

GENETS IN THE STATES.

The Fairchild Airplane Manufacturing Corpn. has received orders for 100 Genet engines from the Arrow Aircraft and Motors Corpn. and for 12 from the Nicholas-Beazley Airplane Co.

47,865 MILES on GIPSY-MOTH without decarbonising

— and still Flying using WAKEFIELD CASTROL XXL

On Sept. 7th the Gipsy-Moth had flown for 563 hours on its Reliability Tour and the seals were still unbroken—equivalent to 47,865 miles.

After 500 hours flying the machine was put over a speed course and clocked only 1 m.p.h. less than the guaranteed all out speed of a brand new Moth.

The climb to 5,000 feet registered the actual guaranteed figure, i.e., 21 minutes.

at the rate of .5 pint per hour or 1,400 m.p.g.

COMMERCIAL AERONAUTICS.

MR. MONTAGUE'S TOUR.

Mr. Montague, the Under-Secretary of State for Air, accompanied by Mr. F. G. L. Bertram, C.B.E., Deputy-Director of Civil Aviation, is making a short tour of Europe by air.

The object of the tour is to compare the systems of operation abroad with those in this country, and to obtain by personal experience a general view of civil aviation activities in neighbouring countries. No special arrangements have been made, and Mr. Montague will travel as an ordinary passenger.

The tour has been arranged to take five days, and will last from Sept. 24 to 28. On the first day, Mr. Montague will fly from Croydon to Rotterdam and Amsterdam by K.L.M. He will then proceed to Hamburg, from where he will fly to Copenhagen and Malmo by the Swedish A.B. Aerotransport.

The next day Mr. Montague will leave Malmo for Dresden, by way of Copenhagen, Lubeck-Travemunde, and Berlin. Mr. Montague will travel by Farman and Luft Hansa lines.

The third day Mr. Montague will fly from Dresden to Vienna, by the Czechoslovak Air Transport Co., and will stop at Prague.

The fourth day Mr. Montague will fly by Luft Hansa from Vienna to Cologne by way of Munich, Nuremberg, and Frankfurt.

The final stage will be from Cologne to Croydon by Sabena, and stops will be made at Brussels and Ostend.

THE AERIAL LINK BETWEEN THE AMERICAS.

Pan-American Airways, the big American corporation formed to link North and South America by a network of air lines is steadily forging ahead. Although a few far-sighted people have pointed out the necessity of linking up the British possessions in the Caribbean Sea by air lines, there is no doubt that America will provide the services and thereby augment her commercial interests in British property, especially as Jamaica is isolated from other British territories.

Pan-American Airways has a strategic advantage in being based on Miami, the holiday resort of such of the wealthy Americans who do not come to Europe. These people regard the Caribbean Sea as their holiday hunting ground and naturally turn to the air as being the best way to explore the area and reach new territories. Thus Pan-American Airways have a big public upon which to draw, while working up their South and Central American sections as pure business propositions.

Colonel Lindbergh, who surveyed the Pan-American routes in 1928, left New York on Sept. 17 with Mrs. Lindbergh to fly round the routes again. Mr. J. T. Trippe, the President of Pan-American Airways, and his wife, are accompanying the Lindberghs. The machines used will be a three-engined Fokker and a Sikorsky amphibian.

The party is flying from Miami to Havana, thence by Porto Rico to Dutch Guiana. From Dutch Guiana the party will return by the coasts of Venezuela and Columbia, where the German Scadta line is firmly established, to Panama and Central America, and so home. A fine trip, but pretty hard going for the ladies through the tropical countries.

Colonel Lindbergh and his party reached Georgetown, British Guiana, on Sept. 23. The previous day they had flown from San Juan, Porto Rico, to St. Kitts, the capital of the Leeward Islands, where they were welcomed by the Governor. The next stage was to Antigua, another island in the same group, where the party had lunch.

After lunch the trip was resumed by way of another British Island, St. Lucia, to Port of Spain, the capital of Trinidad, where the party attended a reception at the Union Club and were afterwards the guests at a Government House banquet.

A SOUND DECISION.

Northern Air Lines have decided that in future no passengers will be carried on journeys which involve a sea crossing in single-engined aircraft.

The Company has been doing a considerable amount of business taking passengers from Manchester to Dublin, Belfast and Douglas, but has now decided that journeys over the sea must not be undertaken until triple-engined aircraft are available.

The loss in revenue will be considerable and it is with the greatest reluctance that the Company turn away this lucrative traffic, but it is felt that "Safety First" must be the guiding principle of Northern Air Lines, so until the new triple-engined aircraft are delivered Manchester people will not be able to cross the sea by air.

The firm is making no alteration in ordinary cross-country journeys and will continue to use single-engined machines where no sea crossing is necessitated.

Sea journeys not carrying passengers will be continued as at present, i.e., goods and newspapers and photographs will be accepted as usual.

If a single-engined aeroplane is forced to land owing to engine trouble a safe landing can almost always be made if over land, but it is felt that engine trouble while over the sea might have serious results although the aeroplanes are usually in touch with shipping and carry special life belts.

Two triple-engined all-metal air liners have been ordered, and delivery is promised early in the new year, these machines are luxuriously fitted, with heated cabins, lavatory, etc. [Are these Fords?—ED.]

One of these machines will probably be used on the Isle of Man service next Spring and the other will be used for general work to London and the Continent.

Afternoon tea trips over Manchester are to be a feature of the company's activities next year. Passengers will be taken for an hour's flight over the City and served with tea while in the air.

THE LARGEST FOKKER.

A report from the New York correspondent of *The Times* states that the new Fokker F.32 made her first public appearance on Sept. 13, when a number of trips with the full complement of crew and passengers on board were made.

The F.32, which has been built by the Fokker Aircraft Corporation of the United States, is a four-engined monoplane with the engines arranged tandem-wise in nacelles under the wing on each side of the fuselage.

The engines are 525 h.p. Pratt and Whitney "Hornet" air-cooled radial engines. The F.32 has accommodation for thirty passengers and a crew of four. The machine has been designed for a top speed of 140 m.p.h., a cruising speed of 120 m.p.h., and a range of 480 miles.

FRENCH AVIATION AND GOVERNMENT FINANCE.

The Paris correspondent of *The Times* announces that an agreement has been concluded between the French Government and the Air Union and the Compagnie Internationale de Navigation Aérienne for financial participation by the State, the agreement being for a period of 30 years.

An agreement has also been concluded by the French Government with the Compagnie Général Aéropostale, the State participation in this case being for 20 years.

The financial participation in the case of the Air Union and Aéropostale is 25 per cent., and in the case of the C.I.D.N.A. 30 per cent.

The agreements, which require ratification, will be laid before the Chamber early in the Session.

WITH THE NIGHT MAIL.

Sabena are opening a night air mail service between London and Brussels on Oct. 1. This service will operate both ways and will result in letters posted at the London Central office before midnight being delivered in Brussels by the first post. For first delivery in London the latest time of posting in Brussels is 22.00 hrs.

The Belgian Post Office is co-operating with Sabena in the new venture and it is a sign of better things that no fee will be charged for the new service until Jan. 1.

Post Offices should use the fastest means of transport available as part of their service to the public, and not charge enormous fees for Air Mail. If Imperial Airways had the entire Indian letter mail contract (about 30 tons a week) would there be any need for a subsidy?

The inauguration of the night service to London will be marked by a ceremony at Brussels aerodrome. M. Jaspar, the Prime Minister, M. Hymans, the Foreign Secretary, and M. Lippens, Minister for Railways, are expected to be present.

During the proceedings a memorial to Major Nelis will be unveiled. Major Nelis, of whom an obituary notice appeared in THE AEROPLANE of April 3, 1929, was the pioneer in Belgium of commercial aviation, and to his foresight and energy are very largely due the present Belgian air lines, and especially the very fine organisation in the Belgian Congo.

THE END OF A SEARCH.

The Times of Sept. 11 states that the Western Australian Airways aeroplane recently chartered by the East Asiatic Company has not found any trace of the missing Danish training ship *Köbenhavn*, although it made a flight of 1,500 miles along the coast, from Broome to Fremantle, and from 25 to 30 miles out to sea.

Learn to fly at

HANWORTH

THE London Air Park at Hanworth, headquarters of the N.F.S. flying organisation, is the ideal instructional centre, where the flying pupil may qualify for the Air Ministry "A" Licence for private pilots, quickly and at the minimum of expense.

Experience shows that the average flying member is able to "pass out" after a period of from 13 to 20 hours' training. The minimum under N.F.S. rules is eight hours "dual" instruction, and five hours' "solo" flying, the cost of this minimum course being under £25.

Not only is Hanworth one of the largest air parks in the country, but as a Country Club it is unexcelled. The Club itself provides first-class residential accommodation; lounges, dressing and drawing rooms, writing room, ball-room and an excellent standard of catering. Tennis and squash racquets courts provide facilities for outdoor recreation. The Hanworth estate covers an area of 230 acres.

A limited number of members are now being enrolled at the following rates: Flying Members, 5 gns. entrance fee, and 5 gns. annual subscription. Non-flying Members, 3 gns. in each case. For 1929, two-thirds of the annual subscription is rebated. Serving Officers of H.M. Regular Forces are admitted without entrance fee. Membership of Hanworth Club confers honorary membership of all other N.F.S. Clubs, and free use of every N.F.S. station. Private flying for qualified members costs as little as £1.1.0 an hour (3½d. a mile). Residential terms at Hanworth range from 5½ to 7 guineas per week.

Write to-day for the N.F.S. brochure that fully describes the privileges of membership and enumerates the services offered to all who wish to fly.

THE AMERICAN AIRCRAFT INDUSTRY.

For the past year or so there has been a tendency in the United States to form groups, or combines, or trusts, of the older and better-class aircraft firms, and to join with them American licensees of the best European firms. These groupings have become so confusing that an American friend has kindly sent from the States an account of them as they were at the end of August.

The larger groups of the various aircraft interests in the United States are as follows:—

There is the Curtiss-Wright group, which so far includes the following companies:—

Curtiss Aeroplane and Motor Co. Inc.
Curtiss Airports Corporation.
Curtiss Flying Service Inc.
Curtiss Aeroplane Export Corporation.
Curtiss-Caproni Corporation.
Curtiss-Robertson Airplane Manufacturing Company.
Wright Aeronautical Corporation.
Keystone Aircraft Corporation (including the Loening Company).
Moth Aircraft Corporation.
New York and Suburban Air Lines Inc.
New York Air Terminals Inc.
Travel Air Company.

Associated with this Group by identity of management, or directorship are National Air Transport, Trancontinental Air Transport, Pitcairn, and part of the Aviation Corporation of the Americas. Also there are two or three Investment Trusts, such as the National Aviation Corporation and the North American Aviation Corporation affiliated with this Group.

The second Big Group is the United Airport and Transport Company which includes the following subsidiaries:—

Boeing Airplane Company.
Chance Vought Corporation.
Pratt and Whitney Aircraft Company.
Hamilton Aero Manufacturing Company.
Boeing Air Transport Inc.
Pacific Air Transport.
Stout Air Services Inc.
Stearman Aircraft Co.
Sikorsky Aviation Corporation.
Standard Steel Propeller Corporation.

Thirdly, there is The Aviation Corporation, which controls a large part of the air transport business in the country, as well as the Fairchild Corporation, and a subsidiary interest in the Waco Company. Its operating subsidiaries are as follows:—

Colonial Airways Corporation.
Interstate Airlines Inc.
Universal Aviation Corporation.
Embry-Riddle Aviation Corporation.
Southern Air Transport Inc.
Fairchild Aviation Corporation.
New York Aviation Corporation.
Aviation Patent and Research Corporation.
Roosefelt Field Inc.
Waco Airplane Company.

The strongest independents, at present, are the Consolidated Aircraft Corporation, Douglas, and Glenn Martin. Consolidated Aircraft Corporation has recently acquired Thomas Morse and a large interest in the Kinner Co.

The Detroit Aircraft Corporation is a recently formed merger which includes Lockheed and the Aircraft Development Corporation, which has just delivered a metal airship to the Navy. The following are subsidiaries of the Detroit Aircraft Corporation:—

Ryan Aircraft Corporation.
Aircraft Development Corporation.
Aviation Tool Company.
Grosse Ile Airport Inc.
Marine Aircraft Corporation.
Blackburn Aircraft Corporation.
Eastman Aircraft Corporation.
The Winton Aviation Engine Company.
Lockheed Aircraft Company.

A LINK WITH THE EAST.

A year ago five Fokker VII.-3M monoplanes flew to Batavia and got there. They were the advanced guard of a regular service scheduled to start for mails only in 1929 and passengers in 1931.

The regular fortnightly service began according to schedule on Sept. 12, when a Fokker carrying 146 kgs. (322 lb.) of mail took off from Schiphol aerodrome.

The distance is well over 8,000 miles, so that our famous Indian Air Line is completely surpassed. Even its ultimate object and goal is surpassed, for Singapore is not the terminus of the Dutch service, but a halting-place *en route*.

Van Tromp nearly swept us off the seas—are we to be flown out of our skies?

IMPERIAL AIRWAYS AND THE CHANNEL PASSAGE.

Imperial Airways Ltd. announced on Sept. 18 that from that date the whole of their Cross-Channel Air services radiating from London will be worked with three engines, and a steward will be carried on all services.

The twin-engine Handley-Page Napier Air liners will be used for working the land section between Paris and Zurich, and for cargo and supplementary services.

Just why twin-engined machines should be safe over 50 to 100 miles of mountain country in the Vosges and Jura regions and in Switzerland and unsafe over a mere 20 miles of Channel is not explained.

A pilot trying to do a slow landing in a small clearing in a forest is just as likely to stall and kill his passengers as is a pilot trying to alight on a glassy sea and misjudging his height.

This decision strikes one as mere eye-wash. Either a two-engined machine is safe or it is not. If it is *not* it should not be used anywhere except over open country with proper landing grounds always within gliding distance.

CANADIAN BORDER TRAFFIC.

According to the returns of the Canadian Department of Customs and Excise, twenty-six American aircraft, valued at $279,528 (approx. £55,960), were imported into Canada during the first quarter of this year.

One hundred and thirty-three American aircraft passed through Customs inspection on entering Canada and 114 on leaving Canada. The majority of these were engaged on the regular air mail routes. Passengers entering Canada totalled 182 and those leaving Canada numbered 165.

One thousand one hundred and sixty-three bags of mail entered Canada and 550 bags passed through outwards.

According to the U.S. Department of Commerce Canadian Colonial Airways, the operators of the New York—Montreal air mail route, carried 63,661 lbs. of mail over 46,276 miles in the first six months of this year for which it received $44,616 (approx. £8,925).

A NEW CANADIAN AERO-ENGINE FIRM.

A new company has recently been formed in Canada for the production under licence of various well-known aero-engines. This new firm is known as Aero-Engines of Canada Ltd. and has a capital of $200,000 (£41,000).

The President is Mr. F. M. Ross, and the Chief Engineer, who is also Works Manager, is Mr. A. S. Suddes, formerly of the Bristol Company.

This firm, who have the manufacturing rights for the whole of Canada for the Bristol Jupiter and Wright Whirlwind, will build these engines. They are also agents for the Cirrus and Cirrus-Hermes air-cooled engines.

A service organisation is being formed so that mechanics specially trained on the various types may be lent to the various operating companies.

ANOTHER NAVAL PROBLEM SOLVED.

Orders for several bomb-sights, said to be capable of dropping 100 lb. bombs down the funnels of battleships have been made by the U.S. War Department from a Connecticut clock-manufacturing company. The device will be made at a cost of $28,000. The instrument which works out the mathematical data for a correct hit is described as being as intricate as a "chain of Swiss watches."

A wholly unreliable report from the U.S. Navy Department states that an order for several plugs capable of being inserted in the chimneys of warships to prevent 100 lb. bombs from penetrating therein has been placed with a Brooklyn Marine Store dealer. The Naval Commission responsible for thinking out this antidote might be described as being as artful as a "cartload of ring-tailed monkeys."

A MATTER OF TONNAGE.

Every week THE AEROPLANE publishes an analysis of the aircraft arriving at and departing from Croydon. Last week the freight carried by Imperial Airways was given as 30¾ *lbs.* This should obviously have been 30¾ *tons*, still people do get queer ideas about British aviation, so this correction may be necessary. And anyhow, in this year of grace 30 tons is almost as ludicrous as 30 lbs.—If it were 300 tons we might feel pleased, but 3,000 would be more reasonable if we were a truly progressive nation.

THE INDIAN MAILS.

The Postmaster-General announces that in order to allow of the posting in London, up to the latest possible moment, of letters for the Indian Air Mail, arrangements have been made for late correspondence to be accepted, as from the Mail to be despatched on Saturday, Sept. 7, at the Post Office, Charles Street, Haymarket, S.W.1, up to 9.25 a.m. on Saturdays. The letters must be handed in at the counter and only unregistered articles can be accepted.

No special charge beyond the ordinary postage and air fees (see the Air Mail Leaflet obtainable at any Post Office) will at present be made.

Digitized by Google

"THE AEROPLANE," SEPTEMBER 4 AND 11.

Will any readers who have finished with their copies of THE AEROPLANE for September 4 and 11 post them to this office as these numbers are completely out of print and the list of applicants for copies is growing apace.

THE LONDON TERMINAL AERODROME.

ANALYSIS OF FIGURES FOR PAST WEEK.

Trips per Day.—Sunday, 20; Monday, 33; Tuesday, 33; Wednesday, 30; Thursday, 33; Friday, 33; Saturday, 30.

IMPERIAL AIRWAYS LTD.:
London—Egypt—India: London—Le Touquet—Paris—Basle—Zurich: London—Ostend—Brussels—Cologne and return: Machines 75, passengers 728, freight 27½ tons. India Route: Inward, passengers 1, mail 710 lbs.; outwards: passengers 2, mail 726 lbs.

AIR UNION:
Paris—London and return: Machines 61, passengers 254, freight 20 tons.

K.L.M.:
Amsterdam—Rotterdam—London and return: Machines 24, passengers 148, freight 13 tons.

SABENA:
Brussels—London and return: Machines 12, passengers 47, freight 7 tons.

DEUTSCHE LUFT HANSA A.G.:
Amsterdam—London and return: Machines 35, passengers 60, freight 8¾ tons.

MISCELLANEOUS:
British machines 14, passengers 17.
Foreign machines 1, passengers 1.
Total number of trips by British machines 89, carrying 745 passengers. Foreign machines 123, carrying 510 passengers.

COMPARATIVE FIGURES.

Week ending Sept. 21:
Machines, 212; Passengers, 1,255; Crews, 500; Total personnel, 1,755.
Corresponding week, 1928:
Machines, 187; Passengers, 1,079; Crews, 356; Total personnel, 1,435.
Corresponding week, 1927:
Machines, 155; Passengers, 990; Crews, 288; Total personnel, 1,278.
Corresponding week, 1926:
Machines, 103; Passengers, 572; Crews, 136; Total personnel, 708.
Corresponding week, 1925:
Machines, 124; Passengers, 556; Crews, 163; Total personnel, 719.
Corresponding week, 1924:
Machines, 110; Passengers, 481; Crews, 132; Total personnel, 613.
Corresponding week, 1923:
Machines, 106; Passengers, 350; Crews, 162; Total personnel, 512.
Corresponding week, 1922:
Machines, 106; Passengers, 321; Crews, 190; Total personnel, 511.
Corresponding week, 1921:
Machines, 82; Passengers, 208; Crews, 105; Total personnel, 313.
Corresponding week, 1920:
Machines, 108; Passengers, 175; Crews, 132; Total personnel, 307.

CROYDON NOTES.

The tri-motor Ford has been flying in and out of Croydon Aerodrome recently. Those who had demonstration flights in her, think extremely well of her performance. She is not considered suitable for work on European Air Lines, however, as her baggage-carrying capacity is wholly inadequate.

It seems that in the States nobody travels with more than a single grip, except multi-millionaires, who carry two grips. In Europe, however, it was the American tourist with his (or usually her) vast cabin trunks, weighing more than the passenger, who caused Air Line folk to demand bigger and better luggage accommodation from designers. Hence the whole nose of the Fokker F.VIII used by K.L.M. opens as the door of a vast luggage compartment and the Argosy has a large baggage space behind the cabin.

American designers who want to capture the Air line trade in Europe should spend a thoughtful half hour in the attic where their wives and daughters store their innovation trunks, gay wtih the labels of European air lines.

Capt. Kingsford Smith, who flew the new Fokker F.IX when in Holland and was present at all her tests, speaks very highly of the machine. She is an 18-seater (two crew) three-engined Jupiter job, and is stated by Capt. Kingsford Smith to be handy to fly and to have a top speed of well over 135 m.p.h. An Imperial Airways pilot tells us that he saw this aeroplane take off on two engines, with a full load. She is, of course, designed to fly on any two engines when fully loaded. This aircraft will be on the London line shortly.

The Aerodrome Authorities are full of admiration for the Ford tail wheel which does no harm to their grass and raises practically no dust at all. The Ford pilots use their ship exactly like a car with decent brakes. They will come down hill at 20 m.p.h. straight for an obstacle which would wreck any other aircraft and turn neatly in the aeroplane's length just before hitting it.

They can probably taxi anywhere unaided to within inches in a gale of wind, and they seem able to shoot through a hangar door with an inch or so to spare on either wing tip, just as the experienced "Baby Austin" owner shoots into the wash-house and comes to rest under the sink. And here are we, ye gods, with aeroplanes which are as often as not more or less out of control when on the ground. It is all very well to model aircraft upon the duck or the goose for flying purposes, but why emulate these uncouth fowl on land also?

On the edge of the Tarmac Apron the early worm is experiencing some difficulty in reaching the surface to schedule, and worms have been emerging as late as noon owing to having to bore their way through patches of sticky stuff laid over small areas of the earth there.

It is not so much with the idea of infuriating the earthworm that the authorities have begun to puddle with liquid adhesives, and queer chemicals, but with a view to alleviating the dust-nuisance, if possible.

Persons accustomed to lounge about the tarmac in the execution of their duty when aeroplanes are taking off, have become inured to being taken behind the ear with large flying flints, and groping about gravel-blind for the rest of the day. But strangers do not really care for the playful habits of aircraft joyously kicking their heels in dry weather, and therefore the activities of the authorities are praiseworthy and laudable, so far as they go.

Before they grow tired of revelling in glucosity, however, we should like to throw out a hint or two about the virtues of several sticky mixtures which have not been tried up to now.

What is the matter with sardine oil and secootine mixed with the interiors of chocolate creams and forced into the soil under pressure?

Again, surely chewing gum, well masticated and rolled flat, is worth a trial? And although the cost of strips of surgical plaster laid side by side gummy side down may be prohibitive, cannot something be done with gum arabic from the backs of part-worn postage stamps, tinctured perhaps with dilute bird-lime to give it the necessary body?

The above suggestions we offer gratis out of the fulness of our heart, but what follows is our own secret process, so valuable that we recommend the Air Ministry to approach us with bags of bullion (Box 123 Hop. THE AEROPLANE) before we are compelled to sell our process to a Foreign Power. Details of our secret cannot, of course, be given here, but we may permit ourselves to boast that we have reduced to a scientific certainty that up to now adventitious process by which the average cook produces an incredible viscosity in that estimable comestible, the welsh rarebit. And we modestly avow that we have found the perfect aerodrome surface, which is, moreover, of a pleasing pale buff colour.

One warning we must give the Authorities, which is that impetuous young pilots must be prevented at all costs from taking off over our patent surface before it has hardened, otherwise the aircraft will infallibly assume the appearance of a well wrapped Egyptian mummy or the cocoon of the common or garden cabbage butterfly.

To the objection that our material will lead to plagues of small rodents along the tarmac edge, we reply that we mix a certain amount of Liverpool virus with our brew, which has the additional advantage of preventing unscrupulous persons removing wedges of tarmac for consumption with their supper beer.

Worms will not pierce our patent surface, for what saith Pliny—"Ye worme brooketh but ill ye aroma of cheese."

Seriously, however, is it not time the Authorities ceased dabbling with mixed adhesives and considered the advisability of paving double the present area at Croydon, because this is what everybody at the Aerodrome wants, and it seems likely it will have to be done sooner or later anyhow. [And anyhow, what is the matter with concrete runways in the directions of the prevalent winds, as they have in America?—C. G. G.]

We recently picked up a rather dull super-crook novel by a woman which immediately rivetted our attention. In it the super-crook used to motor to some secluded field with his loot and a "giant" Fokker monoplane owned by him came and landed in the dark by the light of the car head-lights and took the crook and his loot away to the Continent.

So simple—but what about Customs Clearance for foreign from one of the only two authorised Aerodromes, i.e. Croydon and Lympne, and what about picking up cargo not on the aeroplane's manifest in odd fields? Also, what about the Air Ministry, who take quite an interest in aircraft departing at night for the Continent?

According to the authoress, the aeroplane was kept at an adjacent aerodrome and was fitted with machine-guns.

It was not stated what the Aerodrome Authorities thought of the machine-guns, and altogether it seems a pity this good woman should write on matters about which she has no earthly idea when half a day spent at Croydon would at least teach her that the wind does not "sough" through the wires of Fokker monoplanes, which was one of the crowning absurdities of her book.—SPRY.

THE GREAT VEITCHI VOODOO.

If a portly personage in spats, with here and there a wisp of red tape in his hair and a nasty gleam in his eye, were to advance upon you in Whitehall, muttering, "Veitchi! Veitchi!" would you suppose him to be Arch-Priest of some slightly infamous form of Voodoo, or merely a Government servant afflicted with death-watch beetles boring into his dome—like St. Paul's Cathedral?

In the flesh we did not meet him, but he penned us a mysterious epistle from his Departmental den, headed "Veitchi," and the word was underlined in blood-red ink.

Visions of ourselves swathed in red tape being sacrificed to some fearful Civil Service Deity faded when we turned the page and found that Veitchi was merely a flooring compound with which our offices at Croydon are furnished. We have been inhabiting these offices for eighteen months or more, and this is the first we knew of the delicacy of these floors, which apparently have to be treated something like a convalescent cow in a pedigree herd.

Of a sudden we are urged never to wash our floors except with luke-warm water, and on no account to use common soaps. Soft soap may be used, and perhaps some of the best lavender-scented toilet preparations, and from time to time the floor must be dosed with paraffin (presumably best toilet). Linseed oil must be given in raw, damp weather, and to tone up the flooring after a heavy day, a touch of red oxide is recommended.

A dreadful thing has been happening, for the last eighteen months, however, when all unwittingly, we trod bits of gravel and chalk into the precious floor, and now—alas! too late—we learn that abrasives make our flooring porous.

Heaven help us in stormy weather, if the floors beneath our feet are porous and the cracks in the roof let water in, and may all the Saints succour the unfortunate bloke paying an incredible rental for the room below us, for, without miraculous intervention, he will infallibly drown miserably.

Will not the Labour Government take up our cause? For, burdened by rentals such as made the Feudal System so unpopular amongst the half-starved peasantry, we cannot afford our floors the rich and expensive condiments our Feudal overlords demand for them. And does Whitehall care? Not a bit. Whistling blithely, they probably clean their boots with subtle creams composed of linseed oil, toilet paraffin, soft soap, and red oxide.

SPARKING PLUGS.

The engine of the Macchi 52 which finished second in the Schneider Trophy Contest was fitted with Champion sparking plugs. This same make of plug was used in the same machine when it broke the World's Speed Record in 1928. They were also used in the 1926 Schneider Trophy winner.

Those who know of the great difficulties with which the plug-makers are faced when they have to deal with the high compression of modern racing engines, will realise that the Champion plug must of necessity be numbered among the world's best sparking plugs.

AN A.D.C. APPOINTMENT.

Mr. J. Vivian Holman, formerly of No. 2 (Army Co-operation) Squadron, R.A.F., has joined the Staff of A.D.C. Aircraft Ltd. as Assistant Sales Manager.

Mr. Holman has been an Instructor at the De Havilland School of Flying, Stag Lane, since he retired from the R.A.F. in 1927.

NEW COMPANIES.

AERO DEVELOPMENT AND EQUIPMENT LTD.—Private company. Registered Sept. 6. Capital, £100 in 1s. shares. Objects: To carry on the business of aeronautical, mechanical, electrical, automobile, nautical, civil, structural and consulting engineers, inventors and designers, etc. The subscribers (each with one share) are: W. V. Gilbert, 19, Hillcrest road, Acton Hill, W.3, consulting engineer. G. R. Waygood, Abbey House, Westminster, accountant. W. V. Gilbert is the first permanent director. Secretary: C. B. George. Registered office: 117, Windmill Road, Brentford.

AEROMARINE ADVERTISING LTD.—Private company. Registered Sept. 6. Capital, £2,000 in £1 shares. Objects: To carry on the business of advertising contractors and agents, proprietors of newspapers, etc. The directors are: T. S. Sprigg, The Thatcher House, Claygate, Surrey. C. St. J. Sprigg, The Thatched House, Claygate, Surrey. J. T. Stevenson, Park Cottage, Park Road, Radlett. A. C. Hardy, The Old Nurseries, Esher. F. S. C. Thompson, 4/5, Park Place, St. James's, S.W.1. Secretary: C. Sprigg. Solicitors: A. Bolden, 22A, College Hill, E.C.4. Registered office: 56 and 57, Fleet Street, E.C.4.

MORTGAGES AND CHARGES.

SAFETEX SAFETY GLASS LTD.—Further charge on freehold factory at Hendon dated Sept. 10, 1929, to secure advances not exceeding £4,000. Holders: Safetex Glass Holding Co. Ltd., 21, Great Portland Street, W.

RECEIVERSHIPS (APPOINTMENT OR RELEASE).

E. R. CALTHROP'S AERIAL PATENTS LTD.—W. C. Northcott, C.A., of 6, Great Winchester Street, E.C.2, was appointed Receiver on Sept. 9, 1929, under powers contained in debentures dated April 18 and Oct. 26, 1923, and Feb. 25, 1925.

PERSONAL NOTICES.

Deaths.

LANE.—On Sept. 23, at Grantham, as the result of a flying accident, L-AC. Lane, R.A.F.

SOMERSET.—On Sept. 23, at Hambrook, near Bristol, as the result of a flying accident, Edward V. Somerset, Coldstream Guards, Guards' Depot, Caterham.

TIARK.—On Sept. 23, at Hambrook, near Bristol, as the result of of a flying accident, Edward V. Somerset, Coldstream Guards, Guards' Somerset.

WALLER.—On Sept. 15, at Butterstone, Perthshire, Gwendeln, dearly-loved wife of Sq. Ldr. W. H. de Warrenne Waller, R.A.F., youngest daughter of the late J. H. Lambert, of Redmount, Co. Galway.

Forthcoming Marriages.

GREIG—DEAN.—The engagement is announced between Flt. Lt. D. D'A. A. Greig, D.F.C., A.F.C., R.A.F., and Miss Lorna Elaine Dean, only daughter of the late the Rev. C. G G. Dean and Mrs. Dean, of Bexhill-on-Sea.

HOPE—BALFOUR.—The engagement is announced between Flt. Lt. Eustace Jack Linton Hope, A.F.C., R.A.F., son of the late Major Linton Hope and Mrs. Hope, of Kingshotts, Fernhurst, Sussex, and Evelyn Hope, second daughter of Sir Arthur and Lady Balfour, of Ropes, Fernhurst, Sussex, and Riverdale Grange, Sheffield.

THOMPSON—HILL.—The marriage between Flt. Lt. D. R. W. Thompson and Aileen, daughter of Mrs. Seymour Hill, Park House, Southwell, and the late Rev. J. Seymour Hill, will take place on Oct. 1.

Marriage.

BATEMAN—JOAKIM.—On Sept. 23, in London, Captain Philip Bateman, late London Irish and R.A.F., only son of Mrs. H. Bateman, 36, Cadogan Gardens, and Maisie, elder daughter of Mr. M. Joakim, of Grosvenor House, and Rangoon, Burma.

Births.

FELL.—On Sept. 21, at 48, De Vere Gardens, to Mollie, wife of Lieut.-Colonel L. F. R. Fell—a son.

SANDERS.—On Sept. 17, at 7, Airlie Gardens, W.8, to Mary (née Olivier), wife of Sq. Ldr. A. P. Martyn Sanders, R.A.F.—a daughter.

AIRCRAFT WANTED

(1) **Seaplane [2-seater].** Cruising range 2,500 miles. Maximum speed 150 m.p.h. Cruising 135 m.p.h. Stability must be such that machine will fly for five minutes without touching controls.

(2) **Landplane.** Cruising range 900 miles. Cruising speed 100 m.p.h. Take-off 100 feet. Climb 1,000 feet, per minute. Preferably 3-seater. Landing speed not to exceed 35 m.p.h.

(3) **Landplane.** Capable of cruising 2,500 miles at 122 m.p.h. (top 145 m.p.h.) and landing at 48 m.p.h. Stability such that controls need not be touched for five minutes.

(4) **Light aeroplane** (under 881 lbs. class) with ceiling guaranteed over 25,000 feet.

Special Note.—Orders for the first two types are being placed at once. Every effort will be made to purchase British machines and orders will only be placed abroad if British machines of such special types are unobtainable. If performances close to above can be guaranteed, please communicate immediately with :—

No Connection with any other Firm.

S. LEWIS'S.—The Old Firm of Flying-Racing and Motor Clothing Fame, 19 and 27, Carburton Street, London, W.1. We wish our Thousands of Customers to know we have no connection with any other Firm. Flying Helmets, best Quality, Fur trimmed, 14s. 6d., 12s. 6d.; All Leather Lined Chamois, 10s. 6d., 12s. 6d.; Flat Type Phones, 5s.; Metallic Tubing and Rubber Connection, 2s. 6d.; V Piece and Adapter combined, 3s. 3d.; White Flying Suits, 25s. 6d.; Ditto, with Lightening Fasteners, 35s.; White Combination Suits, 14s. 6d.; White Flying Helmet, 6s. 6d.; Featherweight type Goggles, fitted genuine Triplex Lenses, slightly tinted, new W.D., 7s.; Ditto, fitted genuine clear Triplex Lenses, 11s.; Aviation Mask Goggles, fitted genuine Tinted Triplex Lenses, 14s. 6d.; Ditto, fitted Tinted Triplex, 12s. 6d.; Meyrowitz Luxor Goggles, fitted Triplex unsplinterable lenses, 40s.; R.A.F. Scarf, 5s. 6d.; Pilot's Gauntlets, 12s. 6d. per pair; Suede Golf Jacket, best quality, ideal for flying, 50s. We are contractors to Foreign and Colonial Governments. S. Lewis's, 19 and 27, Carburton Street, London, W.1. No Connection with any other Firm.

Wainwright's Flying Equipment.—Wainwright Flying Helmet (passed by A.M.) lined chamois, 22s. 6d., in Black or Tan, Fur trimmed helmets 12s. 6d., 15s. 6d. White helmets, pique or drill, 12s. 6d. Flat type earphones, complete with connections and "Y" pieces, 12s. 6d. Flying mask goggles, clear or anti-dazzle, 12s. 6d. Genuine R.A.F. Sidcots 57s. 6d. Chrome Leather flying coats, 84s. to £8 8s. Write for catalogue, Wainwright's, 300-302, Euston Road, London, N.W.1. 'Phone: Museum 6280.

Established over 30 years.

THE LEADING HOUSE FOR

AVIATORS' CLOTHING.

Suppliers to National Flying Services.

Fine quality R.A.F. pattern chrome leather coats, fleece lined 105/- and 120/-. Other styles from 85/-. Sidcot pattern flying suits, fitted with fur collar, 60/-. White flying suits, 23/6. Super quality white or khaki flying suits, fitted Zip fastener, 30/- and 35/-. White or khaki flying helmets, latest type, phone pockets, etc. 11/6. Approved Air Ministry pattern helmet, best chrome leather, chamois lined, 22/6-. Flying helmets, all leather, fleece lined, 12/6, fur trimmed, fleece lined 22/6; ditto, chamois lined, 25/- and 27/6. PERFECT FIT ASSURED. Lambswool lined gauntlets, from 18/6. Furbacked gauntlets, lambswool lined, from 25/-. Finest sheepskin flying boots, lambswool lined, fitted Zip fastener, 45/- and 63/-. Genuine D.H. 'phones, all metal, fabric coved, 12/6. Meyrowitz Luxor goggles, fitted Triplex clear or tinted, 40/-. Featherweight goggles, round or pear shaped' unsplinterable, 7/6. Mask goggle, unsplinterable, fur or fleece lined' 12/6. Best quality suede Golf jackets, Zip fastener, 57/6 and 63/-'

AIRCRAFT WANTED.

Urgently wanted, a number of modern light aircraft for cash or exchange. Very best prices offered in part exchange for new machines. Before deciding obtain a quotation from Phillips and Powis Aircraft (Reading) Ltd., Reading Aerodrome. 'Phone Sonning 114.

AVIATION INSURANCE.

Aircraft Comprehensive Insurance.—Aeroplane owners requiring Insurance covering damage, 3rd party, accident and life *should first consult* Services and General Insurance Agency, 108, Victoria Street, Victoria, S.W.1. *Special terms according to experience.*

Advice given and rates quoted.—Apply to **Bray, Gibb and Co., Ltd.**, Aviation Dept., 166, Piccadilly, London, W.1, and 14, Sherborne Lane, E.C.4. All classes of Insurance effected.

PRACTICAL FLYING.

HENDERSON FLYING SCHOOL.—Lt.-Col. Henderson offers unique terms both for "A" and "B" licences. All technical coaching arranged for. Personal attention. Minimum rates. Write to Croydon Aerodrome.

CINQUE PORTS Flying Club (Subsidised) gives cheapest tuition ever offered. Monthly sub. 21s. for 28 days. (No entry fee.) Annual subscription 63s. (entrance 21s.). Moth equipment—Club-room, Bar and Lawn—Perfect Aerodrome near Folkestone, 1¾ road hours from West-End. No waiting list. Write Secretary, Hythe, Kent.—**LEARN AT LYMPNE.**

CHEAPEST FLYING IN THE WORLD! at the Norfolk and Norwich Aero Club. Subscription £3 3s. Instruction rates 25s. per hour. Accommodation can be arranged on Aerodrome. Applications to Secretary, Mousehold Aerodrome, Norwich.

Learn to Fly at the Midland Aero Club. Four tuition machines, two fully qualified expert instructors. No waiting. Particulars Hon. Secretary, 22, Villa Road, Handsworth, Birmingham.

Surrey Flying Services, Croydon Aerodrome (Telephone Croydon 1736) have vacancies in their flying school for pupils at moderate rates. Avro Aircraft used. Residential accommodation at Aerodrome Hotel.

Southern Aero Club.—Thorough Avro Tuition, no waiting list. "B" licences instruction arranged. Apply Secretary, Shoreham Aerodrome, Sussex.

The De Havilland School of Flying, Stag Lane Aerodrome, Edgware, Middlesex. Fourteen machines: Nine Moths, five advanced training machines. Seven Pilot Instructors, Lecture Classes, Restaurant and Recreation Pavilion. The largest and most up-to-date civilian organisation for flying tuition in the British Empire.

PRACTICAL TUITION.

Phillips and Powis School of Flying.—An "A" licence in the shortest time and the lowest cost at Reading. Personal attention, no waiting, concentrated instruction. Gipsy Moths. The School is very successful in turning out good pilots in a minimum time. Write for particulars of recent successes. Make it a flying holiday. Special offer, trial lesson 12s. 6d. 45 minutes Paddington—Reading Aerodrome. 'Phone Sonning 114.

PATENTS.

STANLEY, POPPLEWELL AND FRANCIS, Chartered Patent Agents, Jessel Chambers, 88, Chancery Lane, W.C.2. Telephone, Holborn 6393; Telegrams, "Notions, London."

TUITION.

We offer sound instruction in Aeroplane Design, Fitting and Rigging, and Aero-Engine Fitting and Rigging; also expert training for Ground Engineers (Categories A, B, C and D). All tuition is by correspondence. Write to-day for our "Aeronautical Engineering" Booklet. International Correspondence Schools Ltd., 179, International Buildings, Kingsway, W.C.2.

SITUATIONS VACANT.

Fitters required for Bench and Assembly, preferably used to Aircraft construction. District rate plus production bonus. Long job for capable men. Apply Westland Aircraft Works, Yeovil, Somerset.

Required immediately, Assistant for Stressing Department. Write stating experience, age and salary required to Handley Page Ltd., Cricklewood, N.W.2.

Vacancies for Aeronautical Examiners. Aeronautical Inspection Directorate.—Qualifications required—good general and technical education, thorough engineering training with experience in the testing aircraft metallic and non-metallic materials, thorough knowledge of construction of aircraft components, assembly of complete aircraft and testing installation of aero-engines. Annual Salary—£175-£10-£225 plus Civil Service bonus (present aggregate £259-£322). Apply Secretary, Air Ministry (I.G.), Kingsway, W.C.2.

Wanted, Fitters with up-to-date experience of Air-cooled engines.—Pay £6 10s. and £7 10s. a week. Service in Middle East.—Apply Box No. 5715, The Aeroplane, 27, Pilgrim Street, Ludgate Circus, E.C.4, giving full particulars of service and experience. Single men only.

SITUATION WANTED.

Advertising Manager with first-hand knowledge of the Aircraft Industry offers to aircraft and allied firms advertisement designs—original, arresting, and strong in emphasis of selling points. If you want technical advertisements that are not dull in conception, write for specimens of work, etc., to Box No. 5716, The Aeroplane, 27, Pilgrim Street, Ludgate Circus, E.C.4.

MISCELLANEOUS.

Petrolmotor Castings, partly machined, ½ horse (9s. 9d. per set). Catalogue 3d. Madison's Works, Wade Street, Littleover, Derby.

YOU'LL GET A BETTER BID FOR YOUR MACHINE AT BROOOKLANDS.

Send full particulars of your second-hand aircraft to the Brooklands School of Flying. You'll get a better bid for it there. And a better deal when you buy a new machine in part exchange for your own. The School's Sales Manager knows the second-hand market intimately and pays the full market price

BECOME OWNER PILOTS AT THE LOWEST POSSIBLE COST.—Buy your new Moth at Brooklands—Official D.H. Agents. Through its important financial connections the School can sell on specially attractive hire purchase terms.

SERVICE AFTER SALES.—To those who buy their new Moths from us we offer FREE SERVICE for the first month. The life of an engine depends on its treatment during this period.

REPAIRS AND OVERHAULS.—The School has extensive workshops and undertakes all repairs and overhauls for C. of A.

SPECIAL CHARTER.—Four-Seater Saloon machine available at shortest notice. Any distance.

FIRST-CLASS TUITION—NO SUBSCRIPTION.—Flying tuition at Brooklands is unequalled. Since June, 30 pupils have found that to be well taught *pays* in the end. Sound instruction depends on the *experience* of the Instructor. The following are responsible for the high standard of flying at the School:—H. C. Davis, A.F.C., Managing Director and Chief Instructor, E. A. Jones, C. M. Pickthorn, M.C., J. R. King, R. Y. Bush, who between them have done 14,250 hours' flying.

Ring up Byfleet 437 to fix a trial lesson—or write to

BROOKLANDS SCHOOL OF FLYING,
BYFLEET • SURREY.

The Aerodrome is forty minutes from Waterloo. Five minutes' walk from West Weybridge Station. Trains every hour.

ON GETTING BACK TO WORK.—III.

The Trend of the Trade.

Rather an interesting position is growing up in the Aircraft Trade along lines which older and bigger trades have followed in the past. That is the growth of a clear division between "old" firms and "new" firms.

The Society of British Aircraft Constructors consists of about twenty firms. And apparently one of the objects of the Society is to prevent anybody else from penetrating into that group which were the pioneers of the Industry.

It is not exactly a price-upholding ring. That is not possible, because, as already explained, you cannot get Anglo-Saxons to co-operate, and so a price-upholding ring can only be formed by first forming a Trust—and that can only be done when there are many big firms whose shares can be bought on the Stock Exchange. But its policy is definitely to prevent outside firms from getting into the sacred circle of contractors to His Majesty's Air Ministry.

Originally the Society was formed by manufacturers of war-machines. Most of them at one time or another since the War 1914-18 have made some sort of an attempt to make civil aeroplanes, but almost all of them have been so busy with their war machines that they have never made a civil aeroplane as an economic proposition.

The De Havilland Company alone have practically scrapped the making of war machines, although they made the best in the world of their own types, and they have concentrated on the production of sporting and transport vehicles.

Some of the other firms have taken to making light aeroplanes. A. V. Roe & Co. Ltd. and Blackburns have made quite a success of the Avian and the Bluebird, and the Westland people made a remarkable success of the Widgeon, but they have chosen to give it up in favour of their small three-engined machine. A. V. Roe & Co., Ltd., have also, under the far-sighted policy of Mr. J. D. Siddeley, taken on making Fokker machines in large and small sizes. But many of the firms inside the S.B.A.C. do not make light aeroplanes or civil aircraft of any kind.

The British Aircraft Trade To-day.

The result is that we have now arrived at the very interesting point at which, if you count up all the firms in this country (including the little firms which are just starting, very often with small capital, but with a good deal more capital at the back of them if they want it, and including those which are more or less sporting gambles, though they are run by men who are quite capable of making as

---

**"I AM NEVER KNOWN TO QUAIL
AT THE FURY OF A GALE
AND I'M NEVER, NEVER SICK AT SEA."**

(Sir W. S. Gilbert—*H.M.S. Pinafore.*)

THE LATEST FLYING-BOAT.—The Saunders-Roe Cutty Sark (two Cirrus-Hermes engines) in which Sir Sefton Brancker, Director of Civil Aviation, who is seen sitting in the pilot's seat, flew to La Baule Seaplane Meeting on Sept. 14. He was piloted by Flg. Off. C. E. Chilton, R.A.F., of the Marine Aircraft Experimental Establishment, Felixstowe.

Digitized by Google

good an aeroplane as the older firms can make) you find to your surprise that there are more firms in this country making light aeroplanes or civil aeroplanes and not making war machines, than there are making war machines and not making light aeroplanes or civil machines.

In fact if you count up all the firms which have been registered as limited companies to make aeroplanes, as well as the partnerships which are actually engaged in building experimental aeroplanes with the intention of developing into regular manufacturing firms if their experimental machines are successful, you find that there are definitely more aircraft-constructing firms outside of the S.B.A.C. than there are in it.

The result of the growing up of all these new firms which are designing and constructing civil aircraft must in the end be a distinct improvement in the performance of our civil aircraft. Sooner or later somebody is bound to produce a commercial aircraft which is able to earn its own keep without a subsidy.

The American Pay-Way.

In America air-lines are paying like anything without any subsidies. Just at first on the Trans-Continental Air Mail Route, when the Post Office gave up running its own machines and let the transport of mails out to contract, the contractors were paid at a rate over and above the value of the mails they carried, which did amount in practice to a subsidy. But now the slight supercharge on letters sent by air mail not only pays for their transport, but actually leaves the Post Office a profit over and above what the Post Office pays to the air mail contractors.

In spite of the Post Office cutting the rate at which they are paying the contractors for carrying the mails, one of the contractors wrote the other day and said that they were making so much money that they felt they ought to be in jail.

That is simply the result of using economic aeroplanes, and of telling the World that air transport of mails is worth while, and of delivering the goods when you have got them to convey.

Now the mail contractors themselves realise that they have got to go on doing better and better. Mr. C. M. Keys, when he was here the other day, doubted the correspondent who said that he was making huge profits on air mails. But he did admit that his own great line, National Air Transport Inc., which runs the night mail between Chicago and New York, and runs the trans-Continental through mail over the same route (the other side of the Continent is covered by the Boeing group), was doing quite well on that route and on its various branches to the Southward from Chicago and New York.

The improvement which Mr. Keys mentioned is very simply that N.A.T. and the Boeing group are going to put up the speed of their Trans-Continental mail machines to 150 miles an hour. They are going to carry the mails from New York to San Francisco or from San Francisco to New York, 3,000 miles, in 20 hours.

That means that the machines are going to cruise at 150 m.p.h. and they must have a top speed of about 175 m.p.h. Thinking in terms of our air crawlers of 80 m.p.h. or 90 m.p.h. that sounds alarming, but actually it is as easy as falling off a log.

Any Lockheed with a Pratt and Whitney Wasp of 450 h.p. cruises at 150 m.p.h., and with an N.A.C.A. cowling over the engine it cruises at about 170 m.p.h. Consequently you can load that machine down with mail and it will still cruise quite happily at well over 150 m.p.h.

Ground Organisation.

But even with these machines and reliable engines, C. M. Keys is just as keen as he was when he first acquired Colonel Paul Henderson from the U.S. Post Office as his air-line organiser, on having perfect ground organisation. His method is shown in the action of Trans-Continental Air Transport Inc., commonly known as T.A.T., when one of their Ford tri-motors with six passengers on board crashed into a mountain-top in a storm and killed everybody on board.

T.A.T. promptly stopped the whole of their services, in spite of the fact that, although they had only started on July 8, they had carried over 1,500 passengers and had covered over 250,000 miles on the Trans-Continental route without an accident.

This route is the famous rail- and air route run in connection with the Pennsylvania Railroad. Passengers start from New York by rail at night, cover the middle stretch next day by air, spend the next night in the train and arrive at San Francisco the following evening, thus crossing the Continent in 48 hours without any strain at all instead of taking about five days by rail.

Just because of that one accident T.A.T. stopped their service till they had made a thorough investigation of its cause. And then, having proved that there was nothing the matter with the aeroplane, they went on again with renewed confidence. But when Mr. Keys was over here he foreshadowed some of the ways in which even such accidents as that may be prevented in future. And his group are all out to spend money on perfecting their ground organisation to prevent such accidents.

Which is quite diametrically opposed to our method of humbugging ourselves into a belief in infallible engines and infallible aircraft, and leaving the ground organisation and the ground regulation to look after itself. Our two recent unfortunate accidents proved quite definitely that we do nearly all our flying "hanging on our props," as the pilots say, without worrying how a machine is going to get down in between aerodromes which may be a hundred, or two or three hundred, miles apart and without worrying very much which route it follows to get there so long as it keeps on time.

Looking Backward.

Years and years ago suggestions were made in The Aeroplane that about half-a-dozen observers should be posted at intervals along the Calais-Paris air route whose duty would be simply to telephone by the ordinary land-wires at intervals to St. Inglevert saying where there was fog and where there was low cloud. This would have assured that machines would not be flying blind through fog near the coast when they could have clear air twenty or thirty miles inland, and would not be trapped by low cloud on the Beauvais Ridge when they could go over it and find clear air on the Paris side, or alternatively could go round it, or at worst could be warned to land at Beauvais. These messages would have been transmitted from St. Inglevert to Croydon before the machine started.

FOR THE THIRD ROUTE.—Sir Philip Sassoon's Gipsy-Moth which has just been delivered to its owner by the De Havilland Aircraft Co. Ltd. Sir Philip, who is Chairman of the Royal Aero Club, has just been apppointed to command No. 601 (County of London) Squadron, R.A.F.—(*"Aeroplane" photograph.*)

British Triumphs in the Air, on Land and Sea

1918 A Napier-engined D.H. aeroplane climbed to a height of 30,500 feet in 66 minutes. At this time no human being had ever soared so high.

1921 A Napier-engined Gloster aeroplane won the Aerial Derby. Speed 163·4 m.p.h.

1922 A Napier-engined Supermarine flying-boat regained the Schneider Trophy for Great Britain at a speed of 149 m.p.h.

1922 A Napier-engined Gloster aeroplane won the Aerial Derby. Speed 180 m.p.h.

1923 A Napier-engined Gloster aeroplane won the Aerial Derby. Speed 192.4 m.p.h.

1926 The first non-stop crossing of South Atlantic Ocean carried out by Commandante Franco flying a Dornier flying-boat with two Napier engines.

1927 Schneider Trophy won by a Napier-engined Supermarine-Napier seaplane flown by Flight-Lieut. S. N. Webster, A.F.C. Speed 281.669 m.p.h.

1928 Capt. H. S. Broad, flying D.H. Hound, fitted with Napier engine, secured three World's speed records whilst carrying loads of 500 and 1,000 kilogrammes.

1928 The greatest formation flight ever carried out was made with four Supermarine-Napier Southampton flying-boats, each fitted with two Napier engines. The machines flew from England to Australia, round Australia and back to Singapore, covering 180,800 engine miles without mechanical trouble.

1929 The first non-stop flight from England to India was carried out with a Fairey monoplane fitted with Napier engine. 4,130 miles in 50 hrs. 38 mins.

* * * *

1929 The highest speed ever attained on land was made by Major Sir Henry Segrave when he drove his Irving-Napier car over one mile at the amazing speed of 231.36 m.p.h.
Capt. Malcolm Campbell set up world's land speed records at Verneuk Pan with his Napier Arrol-Aster as follows :—over 5 miles, speed 211 m.p.h.; over 5 kilometres, speed 216.53 m.p.h. They both used Napier engines.

* * * *

1929 The world's motor-boat speed championship was won at Miami by Major Sir Henry Segrave, driving Sir Charles Wakefield's Napier-engined "Miss England."
Sir Henry Segrave at the Lido with the same boat made six runs over the measured mile, averaging a speed of 92.8 m.p.h.
At this meeting, competing against the best from Italy and America, Sir Henry Segrave won all trophies including the Duke of Piedmont's cup and Count Volpi's cup.

This was in the days before wireless on aircraft, and when there were three competing English lines to Paris, besides the French lines. But neither our Department of Civil Aviation, which was then under Sir Frederick Sykes, nor the French Air Authorities, nor the air lines themselves, would do anything about it.

The whole cost would not have been more than about £20 a week, but rather than spend that amount of money on proper ground organisation the air lines kept on hanging on their props and trusting to luck. The result was that the whole route between Calais and Paris was marked by the wrecks of machines which had been forced to land by bad weather, and the Beauvais Ridge itself was described as bristling with the tails of machines which had stuck their noses down through the trees.

Even allowing that the machines used in those days were mostly obsolete war machines and not worth much, there must have been £20,000 or £30,000 worth of machines wrecked simply to save the expenditure of a thousand or a couple of thousand pounds a year. And we still go on in that same fool way, except that we now have wireless.

The Modern Way.

Trans-Continental Air Transport and National Air Transport are laying out a regular scheme of ground organisation to make flying possible at any time of the day or night and in any kind of weather, barring perhaps a full blizzard.

They are making elaborate experiments to find out whether a radio beacon is better than directional wireless.

The radio beacon, which tells the pilot by means of two little white vibrating fingers on his instrument board whether he is to the left or the right of his direct line, is an almost infallible guide, but it has the disadvantage that it pulls the pilot straight through fog areas, storms, and everything else. It is a beautiful thing in fine weather, but it has its disadvantages in bad weather.

The other idea is to have a perfect system of ground stations for weather observation all along the route, and well on each side of it, so that the machines may be directed by wireless which way to go to avoid the fog areas or storm areas which may be about at that particular time.

This means that in effect the Americans are considering not only direction-finding wireless but direction-giving wireless.

Collating the weather reports every few minutes from a wide belt of country all along a route of a thousand miles at a time, keeping tab on where the various machines are on that route, keeping in touch with them and telling them where to go, and so forth, all sounds frightfully elaborate. But as a matter of fact it is only a natural development of the work that is done every day and all day long in the train-despatching departments of any properly organised railway.

Such an elaboration of ground organisation and ground control would simply horrify any of our air line people, who, thanks to lack of financial enterprise in this country, have to rub along on inadequate capital just as Queen Elizabeth's sea captains had to man and equip their fleets without any financial support from her.—And our air lines cannot even practise piracy on the High Seas as an additional source of revenue as our sailor-men did.

Night-Flying.

By the way, there was one rather interesting minor point made by Mr. Keys in discussing the air line business. Having described the 150-mile-an-hour postal machines for the trans-Continental route, he said that there was no sense in using these high-speed machines on the Chicago-New York Night Mail service.

All business letters at either city are posted before 19.00 hours, and nobody wants them next morning before 09.00 hours, so the Night Mail has fourteen hours in which to cover about 1,000 miles and allow time for handling at each end. Consequently the old machines which have averaged their 100 miles an hour for the last six years are still quite good enough for that job.

But that principle means economy on any night mail line, even with the most modern aircraft, because whatever developments happen, we shall always have to pay for speed. We may not have to pay as highly for speed as we do at present. But when we have reduced our power-to-load cost to the lowest possible figure we shall always be able to carry a big load flying slowly at the same cost as a light load flying very fast.

This is a very good argument for the establishment of a comfortable slow-flying night mail line between London and Berlin, cruising at say 125 or 130 m.p.h. If our people in this country will not consider it, no doubt the Luft Hansa people will have such a line at work in a year or so from now.

Radio versus Light.

All this development of air-mail and passenger flying in the States is producing a rather interesting argument on the relative merits of wireless beacons and light beacons.

In course of time, no doubt, what with television and such things, although we shall not be able to see through fog by mere penetration, we shall be able to receive pictures of the aerodromes ahead of us transmitted through fog.

Even now, with fixed radio-beacons to give the proper fixed line for an air route, and swinging radio-beams, like the beams of a lighthouse, to let pilots know the direction of any particular radio-beacon, wherever they may be, we are already very nearly as far advanced in the indication of direction by radio as we are by light. Consequently sooner or later there is going to be a very nice little war in aerodrome equipment between the lighting people and the radio people. Lighthouses can do wonderful things in clear air, but a very small patch of fog puts them out of action.

Chicago's Latest.

One of the most interesting things in the way of lighthouses is a beacon which is being put up as a gift to aviation by Mr. Elmer Sperry, of the Sperry Gyroscope Company, on the top of the Palmolive Building in Chicago. One forgets how high the Palmolive Building is, but it is one of Chicago's efforts to out-Woolworth Woolworth, and to make the Eiffel Tower look like a tooth-pick. Whether it runs to 1,000 feet or more matters very little, the point is that it is away up above normal lake fogs.

The beacon has two billions of candle power, with something very special in lenses, and the makers claim that it has a range of 500 miles. Admitting that it has, the quaint situation arises that such a range is useless for most of its length and much of its time.

A friend of The Aeroplane in Chicago has worked out that if the beam, even from its immense height, is arranged so as to pass as a tangent to the curve of the Earth's surface at about 1,000 feet, most of the other end of the beam will be quite unusable, because it will disappear into the air at a height which no aeroplane will ever reach. At 300 miles the beam will be at 39,000 feet.

MOTH MAIL CARRIERS.—Five Gipsy Moths, three with a mail compartment in place of the front seat, and two with coupé heads, belonging to Union Airways Ltd., of South Africa. This company is in receipt of a subsidy from the Union Government for the transport of mails between Cape Town, Port Elizabeth, Bloemfontein and Johannesburg, and also between Port Elizabeth, East London and Durban.

All the same, this Sperry beacon must be quite a nice light, for our Chicago friend says that a pilot took a machine up into the beam and was able to read ordinary newspaper print by it at a distance of fifty miles. Imagine being able to read at Brighton by the light of a beam from the Crystal Palace.

Obviously the fallacy of this enormous light is that although it is superior to low fogs owing to its height it is well up among low clouds. And therefore it can only be useful on quite clear nights.

Fog Penetration.

There is, however, a statement going about that the Sperry people have been trying some very interesting experiments with the penetration of light through fog. Lieut. Doolittle, of the U.S. Army Air Corps, one of America's best and most daring pilots, has been doing quite a great deal of research work, including much dangerous flying in fog, to discover what can be done in the way of making light penetrate so as to make landings possible in fog. The Sperry firm are coupling with it beams from radio-beacons, and fog altimeter using super-sonic (that is to say inaudible) sound-waves, up around 27,000 cycles, past even the range of a cat's ear.

There is a story in America that a good deal of this "ex-Sperry-menting," as some funny fellow called it, has been done by the Sperry Company's London Office, where the observers found that a covered van in the street which was invisible from the third floor when stationary could easily be seen from the sixth or eighth floor when moving. Personally one believes that this is a pure American invention, because as a matter of fact we do not have fogs in this country of such density.

At any rate, anybody relying on our fogs for such an experiment might have to wait a couple of years for a suitable one. The last time one saw a really good fog was going into New York down the Hudson River from Cleveland.

The idea is to develop a combination of radio-beacons and the super-sonic sounder. Between air-ports the pilot will fly on the regional beacon, and, when he reaches his port, will pick up a purely local beacon casting a beam along the run-way.

The super-sonic indicator, which, Mr. Sperry says, can be calibrated to inches, will bring the pilot down to within thirty feet. And after that he will have what Mr. Sperry calls the "barber's pole" effect of the ground rushing past below him, to give him the signal to flatten out and land.

Meantime the various lighting people are doing their best to penetrate fogs. But unless somebody makes some fresh discovery in optics they may find themselves left out in the cold altogether by these radio beams which work just as well in clear weather as in thick, but seem to prefer fogs. Things rather look as if unless our lighthouse manufacturers bestir their tame scientists they will find themselves in very much the same boat as the carriage-making industry did when motor-cars came along.

Our Air-Park Issue.

This subject of the organising of air routes and the laying out of aerodromes and lighting and so forth is quite one of the most important subjects of the present day. Consequently there is good reason for devoting particular attention to it just now, while people have time to think and make arrangements for the real flying season next year, when there is certainly going to be an enormous boom in flying.

Therefore the management of The Aeroplane have decided to bring out on October 23 a special Air-Park Issue of The Aeroplane, with the idea of providing people who are interested in organising air-parks with the kind of information that they will want in the near future.

Hitherto our idea of an aerodrome has been a field with a shed or two on one side of it, with luck, a petrol pump near the sheds. Croydon Aerodrome just happened. It was certainly not designed. Otherwise the sheds would never have been arranged as they are, so that if a machine is wanted out of the back of a shed everything in front of it has to be moved before it can be got out. No more intelligence was shown in designing Croydon Aerodrome than has been shown in designing the average motor garage of to-day, which is still built on the lines of a rather inefficient mediæval coach-house.

The only proper aerodrome in this country which started as an open piece of land and was built up as an aerodrome *ad hoc*, is the Air Park at Heston, and probably by now, even though it is not yet finished by a very long way, one hopes, the proprietors, Messrs. Norman and Muntz, have discovered a dozen ways in which they would have made it different if they had started at the beginning with their present experience.

Nevertheless the fact remains that it is the best laid-out arrangement of aerodrome buildings for the purposes of Civil Aviation in this country, and it might well serve as a model for the designs of the various civil aerodromes which will ere long be started in this country.

Sir Alan Cobham's Crusade.

With very little attention from the London newspapers but with an enormous amount of support from the local newspapers wherever he has been, Sir Alan Cobham has spent all this Summer journeying from one city or big town in England to another, spreading the Gospel of Aviation and inducing the various city councils and other authorities to take an interest in the immediate need for municipal aerodromes. At every city or town he has taken up the Mayor and the Corporation and the Borough Surveyor and the City Engineer and other officials of importance so as to let them see their own home towns from above. And in making these flights over and over again around the same town or city Sir Alan has himself learned an immense amount about how to select the best spot for an aerodrome.

Only the other day he told one that what appears to be the most obvious site for an aerodrome is almost always the wrong site when you come to take all the needs of the town and of an ideal aerodrome into consideration. He said that quite often the best place for an aerodrome has turned out to be in about the last place where you would think of looking for it at the start.

Realising this need for municipal aerodromes all over the country, and to back it up as strongly as possible the fine work that Sir Alan has been doing, the Special Air-Park Issue of The Aeroplane will be devoted to all those subjects which will be of value to the municipalities, or even the small towns, which are thinking of starting aerodromes, either on a scale suitable to a great city or to comparatively small townships in the British Dominions Overseas.

Some Contents.

Sir Alan Cobham has kindly consented to write an article for The Aeroplane on "How to Choose an Aerodrome." As already stated his experience of the past six months has given him, in spite of all his years of experience, some quite new views on this subject.

Messrs. Norman and Muntz of the Heston Air Park have promised to contribute an article on "The Laying Out of an Aerodrome," giving some of their experiences in the organisation of the Heston Aerodrome. Also one gathers that their experience will be at the disposal of anybody who may be laying out an aerodrome in the future. Certainly after all the work they have done they, or rather their firm, Airwork Ltd., are entitled to rank as first-class aerodrome engineers.

Arrangements are also being made with Mr. A. C. M. Jackaman of Slough, perhaps better known at present as a brilliant pilot than he is in his true rôle as an unusually competent building contractor, to contribute an article on "How to Put Up Aerodrome Buildings." The "Social Focus" and the "Arch of Ctesiphon" at Heston are outstanding examples of how thoroughly good building can be done by British workmen in record time.

In addition this Air-Park Issue will contain a mass of information gathered from American publications,—seeing that in America there are a dozen fully-equipped air-parks for every empty landing ground that we have in this country.

Aviation is going ahead at such a rate throughout the British Empire that the information in this Air-Park Issue may ultimately prove to be of even greater value in the Dominions Overseas than it will be in this country. But the immediate business will certainly be done in this country.

With that end in view the Air-Park Issue of The Aeroplane will be placed in the hands of every Lord Mayor, Mayor, City Surveyor, Borough Surveyor, and Municipal Engineer of every town of importance in this country. And it will go likewise to the chief officials of every township of importance, where flying is likely to develop, in the British Empire.

This will be The Aeroplane's first contribution of the new Season towards putting the development of Civil Aviation next year on a sound basis.—C. G. G.

A NEW PRIZE FOR AVIATION.

During the last fortnight the Supermarine-Rolls-Royce S.6 and the Schneider Trophy have been on exhibition in *The Evening World* Pavilion at the North-East Coast Exhibition, Newcastle-upon-Tyne.

The Evening World is presenting the Lord Mayor of Newcastle, Alderman A. W. Lambert, with a sum of about £1,575 for the provision of an Aviation Trophy to be competed for annually. This sum will be the money obtained as receipts for admission to the Pavilion after deducting the costs of moving and exhibiting the machine.

The Evening World is the latest production of the Northcliffe organisation and is now being published in Newcastle-upon-Tyne and Bristol.

The presentation of the above Trophy is sufficient proof that the interest shown in Aviation by the late Lord Northcliffe is not being allowed to lapse.

ARMSTRONG WHITWORTH
AIRCRAFT

THE ALL STEEL ATLAS

(ON WHEELS, FLOATS OR SKIS)

THE all-steel Atlas is the best aircraft for land or sea reconnaissance.

It is the standard Army Co-operation two-seater of the Royal Air Force.

Its steel construction accounts for its unrivalled durability and ease of maintenance. Fitted with the world-famous Armstrong Siddeley Jaguar engine (plain or geared type), its speed, climb and ceiling fulfil the severest Service requirements. It is produced on the grand scale by the best equipped aircraft works in Europe.

THE INTERNATIONAL SAFE AIRCRAFT COMPETITION.

Nine new entries have been received by The Daniel Guggenheim Fund for the Promotion of Aeronautics for the International Safe Aircraft Competition, making a total entry list of twenty-five, of which three are from Great Britain.

The new entries, all of whom are American manufacturers, are as follows:—

Gates Aircraft Corporation, New York City.—American manufacturers of Belgian R.S.V. aircraft. Gates R.S.V. Mono-biplane, two-seat, open-cockpit biplane, designed for training and sport purposes. Renard five-cylinder air-cooled radial engine.

Taylor Brothers Aircraft Corporation, Bradford, Pa.—A high wing, two-seat, side-by-side cabin monoplane with variable incidence. Kinner K-5 engine.

Command-Aire, Inc., Little Rock, Arkansas.—Standard production model, Type 5-C-3, three-seat, open cockpit biplane. Curtiss Challenger engine.

Ford-Leigh Safety Wing, Inc., Jackson Heights, Long Island.—Two-seat, open cockpit biplane, with Leigh Safety Wing device. Curtiss OX-5 engine with Kirkham valve gear.

Moth Aircraft Corporation, Lowell, Mass.—American manufacturers of the De Havilland Moth. Two-seat, open cockpit biplane and fitted with Handley Page automatic auxiliary airfoils. D.H. Gipsy engine.

John H. Wiggins Co., Inc., Tulsa, Okla.—Two/four-seat, open cockpit biplane with special flaps and slot design. Wright J-6 5-cylinder radial engine.

V. J. Burnelli, Keyport, New Jersey.—Two-seat, twin-engined monoplane with variable camber-wing. Four-wheeled landing gear with special tyres and brakes. Two American Cirrus Mark III engines, with ability to fly on either engine.

Bourdon Aircraft Corporation, Hillsgrove, R.I.—Three-seat, open cockpit biplane, Model B-4. Kinner K-5B engine.

Whittelsey Manufacturing Co., Inc., Bridgeport, Conn.—A modified Whittelsey Avian two-seat, open cockpit biplane, fitted with Handley Page slots. Cirrus Hermes engine.

Those entries previously accepted are:—

United States.—Heraclio Alfaro, Brunner-Winkle Aircraft Corp., Cosmic Aircraft Corp., Cunningham-Hall Aircraft Corp., Curtiss Aeroplane and Motor Co., Inc., Dare Airplane Co., Fleet Aircraft, Inc., Charles Ward Hall, Inc., J. S. McDonnell, Jr. and Associates, Pitcairn-Cierva Autogiro Co., Rocheville Aircraft Corp., and Schroeder-Wentworth Associates.

Great Britain.—Handley-Page, Ltd., The Gloster Aircraft Co., Ltd., and the Cierva Autogiro Company.

Italy.—The Societa Italiana Ernesto Breda of Milan.

Five further applications for entrance have been submitted, but as yet the specifications are inadequate. With this exception, the entry list is closed. Competitors have up to Oct. 31 for the presentation of their entries at Mitchel Field, Long Island, N.Y. Two of the three British entries, the Cierva Autogiro and the Handley Page biplane, which is irreverently known as the "Gugnunc," have already left this country.

THE SPRIGHTLY FUNGUS.

There has been a conference of mycologists in London. Mycologists are people who specialise in the habits of fungi and other similar growths. The interesting point about the conference is the fact disclosed by some of the delegates that aircraft have been used to obtain certain data.

A disease of wheat known as rust causes an average loss in Canada of £5,000,000 a year. This disease is due to fungi. Fungi are propagated by the diffusion of spores, and in order to trace these spores, gelatine-covered slides carried on aeroplanes were exposed at different altitudes. By such means these spores were found to be coming from the south. Spores had been trapped at 10,000 feet.

Another delegate said that he had found living organisms 15,840 feet above the earth.

BLIND FLYING.

On Sept. 24, Lieutenant Doolittle, who is temporarily loaned by the U.S. Air Corps to the Daniel Guggenheim Fund for the Promotion of Aeronautics, took-off, flew a distance of fourteen miles, and landed again at the point of take-off flying "blind."

He used a two-seat Consolidated biplane and sat in the back seat with a hood completely covering the cockpit. A second pilot occupied the front cockpit who could take over control in an emergency.

Lieutenant Doolittle took off and flew five miles along the path of a radio beacon and returned along the same path. He then flew two miles further and returned to make a perfect landing at the place from which he started.

The instruments which made this flight possible are stated to be a new gyroscopic compass, an extremely sensitive altimeter, an artificial horizon, and the two-reed wireless-beacon receiver.

The artificial horizon is probably similar to our "turn indicator," though the American instrument is stated to show whether the nose of the aeroplane is up or down. The two-reed wireless-beacon receiver was described in The Aeroplane of Dec. 26, 1928.

This instrument has two vibrating reeds, the ends of which are free to vibrate side-by-side in an opening in the cover. When the machine is heading directly towards or directly away from the beacon the reeds vibrate with the same amplitude. Should the aeroplane deviate either way from its path towards the beacon, one or other of the reeds will vibrate with greater amplitude and the other with less.

The following cable relative to the above has been received by Major R. H. Mayo, British representative of the Daniel Guggenheim Fund for the Promotion of Aeronautics, from Mr. Harry F. Guggenheim, President of the Fund.

As a result of tests successfully conducted this morning at Mitchel Field I take pleasure in informing you that the Daniel Guggenheim Fund for the Promotion of Aeronautics is able to report a solution of the hitherto unsolved last phase in the problem of flying through fog. In conditions representing the densest fog, flying in a covered cockpit and guided entirely by his instruments Lieutenant J. H. Doolittle conducting the experiments was able to take off from the airport, fly from it, return to a given spot and make a landing. It is significant that the achievement is realised through the aid of only three instruments which are not already the standard equipment of any airplane.

Harry F. Guggenheim.

PRACTICAL RESEARCH.—Lieut. J. H. Doolittle standing in front of the Vought Corsair biplane (Pratt and Whitney Wasp engine) which is used by the Guggenheim Foundation for the Promotion of Aeronautics in their fog or "blind" flying experiments.

A New Armstrong Siddeley Engine —the GENET MAJOR

Front view showing the enclosed Valve Gear and streamline rocker covers.

THE 100-110 h.p. Genet Major represents the results of ten years' continuous progress in the design and manufacture of air cooled radial engines. It embraces many of the most successful features of the latest Jaguar, Lynx and Mongoose engines and is specially suitable for powering light aircraft and multi-engined aeroplanes.

LEADING FEATURES:

5 cylinders 4.25" or 108 mm. x 4.5" or 114.3 mm. 319 cubic inches or 5.23 litres. Compression ratio 5.23 to 1. Normal r.p.m. 2200. Rated normal B.H.P. at sea level 100, actual 103. Maximum B.H.P. at sea level 110. Weight complete with two magnetos, carburettor, air intake, propeller hub and tachometer drive 250 lbs. or 113.5 k.g. Overall measurements: diameter 38" or .95 m., length 36.2" or .905 m.

THE ROYAL AIR FORCE.

The London Gazette.

September 24.

ROYAL AIR FORCE.

GENERAL DUTIES BRANCH.—The following are granted S.S. comns. as Plt. Offs. on probation with effect from and with seniority of Sept. 13:—H. C. Adams, S. H. Bell, D. P. A. Boitel-Gill, J. C. L. Bruce, R. R. Chapman, L. E. Chiswell, G. B. S. Coleman, C. R. Davies, J. Ll. M. Davys, S. W. H. Egan, G. Egerton-Hine, T. N. Fraser, J. S. Hamilton, C. J. Hansford, J. N. Hepworth, L. M. Hooper, R. G. Hosken, N. C. Hyde, B. N. Matson, L. R. Mouatt, E. E. Noddings, R. C. Parker, I. N. Roome, K. N. Sayers, G. D. Seabourn, M. W. Simons, S. D. Slocum, J. A. MacD. Teacher, H. J. Ward, C. A. Washer, H. J. Wilson.

Plt. Off. on probation A. J. P. Groom is confirmed in rank (Aug. 15); Plt. Off. R. V. Redpath is promoted to the rank of Flg. Off. (Sept. 2); Plt. Off. H. J. Cross is promoted to the rank of Flg. Off. (Jan. 18) (substituted for the notification in the *Gazette* of Aug. 20).

The following Flg. Offs. are transferred to the Reserve, Class A:—E. C. G. Badcock (Sept. 20); H. C. Macphail (Sept. 22).

Flg. Off. C. H. G. Bremridge resigns his perm. comn. (Sept. 17); Plt. Off. on probation A. C. Baber resigns his S.S. comn. (Sept. 17); the S.S. comn. of Plt. Off. on probation A. R. Armstrong is terminated on cessation of duty (Sept. 21).

ACCOUNTANT BRANCH.—Plt. Off. on probation H. A. Frost is confirmed in rank and promoted to the rank of Flg. Off. (Sept. 9).

CHAPLAINS BRANCH.—The Rev. D. F. Blackburn is promoted to the rank of Wing Cdr. (Aug. 16); the Rev. F. W. Hilborn relinquishes his S.S. comn. on transfer to the Army (Sept. 12).

LEGAL BRANCH.—Flt. Lt. G. S. Marshall, O.B.E., is granted the acting rank of Sq. Ldr. with pay and allowances in Class B.B. (Army) rates, whilst employed as Deputy Judge Advocate-General, Middle East Command (Aug. 9).

MEMORANDA.—The permission granted to Sec. Lt. A. B. Whiteley to retain his rank is withdrawn on his conviction by the Civil Power (July 10). The permission granted to Lt. E. W. Carmichael to retain his rank is withdrawn on his enlistment in the Supplementary Reserve (Aug. 20).

RESERVE OF AIR FORCE OFFICERS.

GENERAL DUTIES BRANCH.—G. S. Ogilvie is granted a comn. in Class A.A. (i) as a Plt. Off. on probation (Sept. 9).

Flg. Off. C. H. G. Bremridge is granted a comn. in this rank in Class C on resignation to his perm. comn. in the R.A.F. (Sept. 17).

The following Plt. Offs. are promoted to the rank of Flg. Off.:—W. E. Hampton, P. G. Philcox (Sept. 19); L. C. Williams (Sept. 20). Flg. Off. T. H. Finney is transferred from Class A to Class C (May 30). The following relinquish their comns. on completion of service:—Flt. Lt. C. F. Briggs (Sept. 20); Flg. Off. C. H. Bird (Sept. 15); Plt. Off. V. P. Field (Sept. 7) (substituted for the notification in the *Gazette* of Sept. 10).

Flg. Off. G. G. Williams is removed from the Service (Sept. 11).

Appointments.

Week ending Sept. 30.

GENERAL DUTIES BRANCH.—Wing Commander F. W. Stent, M.C., to R.A.F. Depot, Uxbridge, on transfer to Home Establishment, 27/8.

Squadron Leader H. W. Woollett, D.S.O., M.C., to Station H.Q., Manston, 17/9.

Flight Lieutenants K. B. Lloyd, A.F.C., to 204 Sq., Mount Batten, 13/9. H. M. Mellor, to No. 3 Sq., Upavon, 13/9. C. P. Brown, D.F.C., to H.Q., 'Iraq Command, 28/8.

Flying Officers C. H. Hockly, to No. 6 Sqdn., 'Iraq, 2/9. F. G. Fairhead, to No. 6 Sqdn., 'Iraq, 19/8. S. R. Groom, to H.Q., Wessex Bombing Area, Andover, 12/9. R. A. Chignell, to Andover Communication Flight, 12/9. G. Wood, to R.A.F. Depot, Uxbridge, 16/9.

Pilot Officers E. C. Granville, G. F. P. O'Farrell, to No. 12 Sqdn., Andover, 2/9. R. I. Johnson, T. E. Whittome, to No. 100 Sqdn., Bicester, 2/9. The undermentioned Plt. Offs. are posted to the R.A.F. Depot, Uxbridge, on appointment to S.S. Comns. with effect from 13/9. H. G. Adams, S. H. Bell, D. P. A. Boitel-Gill, J. C. L. Bruce, R. R. Chapman, L. E. Chiswell, G. B. S. Coleman, C. R. Davies, J. L. M. Davys, S. W. H. Egan, G. Egerton-Hine, T. N. Fraser, J. S. Hamilton, C J. Hansford, J. N Hepworth, L. M. Hooper, R. G. Hosken, N C. Hyde, B. N. Matson, L. R. Mouatt, E. E. Noddings, R. C. Parker, K. N. Sayers, G. D. Seabourn, M. W. Simons, S. D. Slocum, J. A. MacD. Teacher, H. J. Ward, C. A. Washer, H. J. Wilson, I. N. Roome

MEDICAL BRANCH.—Squadron Leader G. H. H. Maxwell, M.B., to No. 3 F.T.S., Gantham, 30/9.

Flight Lieutenant V. S. Ewing, M.B., to No. 1 School of T.T. (Apprentices), 7/9.

Flying Officer R. E. Alderson, M.B., to Princess Mary's R.A.F. Hospital, Halton, 12/9.

STORES BRANCH.—Flying Officer F. R. Lines, to Station H.Q., Hawkinge, 22/9.

The Prince of Wales's Pilot.

Mr. Edward Hadley Fielden, A.F.C., Reserve of Air Force Officers has been appointed pilot to H.R.H. the Prince of Wales, K.G. Mr. Fielden will pilot the new D.H. Moth which has just been bought by His Royal Highness.

The Prince of Wales will continue to use the Service Wapiti maintained for his use by No. 24 (Communication) Squadron, R.A.F., for transport to official functions.

Mr. Fielden entered the R.A.F. with a short service commission in January, 1924, and after a course of flying instruction at No. 2 Flying Training School, Digby, was posted to No. 25 (Fighter) Squadron, Hawkinge. In July, 1925, he was posted to No. 23 (Fighter) Squadron, Henlow. In September, 1926, he was posted to the Duxford Station Flight. He was placed on the Reserve in January, 1929.

No. 601 (County of London) Squadron.

Sir Philip A. G. D. Sassoon, Bart., G.B.E., C.M.G., M.P., formerly Under-Secretary of State for Air, has been appointed to command No. 601 (County of London) (Bomber) Squadron, Auxiliary Air Force.

No. 601 (County of London) Squadron was commanded from its formation in August, 1925, by Sq. Ldr. the Lord Edward Grosvenor, who died on Aug. 26, 1929.

No. 33 (Bomber) Squadron.

No. 33 (Bomber) Squadron, R.A.F. moved from Eastchurch to Netheravon on Sept. 14, 1929.

The permanent station of No. 33 (Bomber) Squadron, which is one of the Squadrons which has been formed this year to replace the two Squadrons transferred to India, is at Netheravon.

No. 33 (Bomber) Squadron is equipped with Hawker Horsleys, and is commanded by Sq. Ldr. F. P. Don.

A Fatal Accident.

The Air Ministry regrets to announce that as the result of an accident near Grantham to an Atlas machine of No. 3 Flying Training School, Grantham, on Sept. 23, 364690 L-AC. Ernest George Pritchard Lane, was killed and Flt. Lt. Reginald Pyne, D.F.C., the pilot of the aircraft, was dangerously injured.

FROM VECTIS.—The Saunders-Roe A-10 single-seat fighter ship-plane (Rolls-Royce F-XIS engine), the first landplane of its type produced by the well-known producers of marine aircraft.

Digitized by Google

The Lafferty Cup Competition.

The Royal Air Force College, Cranwell, has been invited to compete in the Lafferty Cup Competition. This competition consists of the 1½ mile relay race, one mile race, high jump and 50 yards swim.

In previous years the Competition has been between the R.M.A., Woolwich, the R.M.C., Sandhurst, the R.M.C., Duntroon, Australia, and the R.M.C., Kingston, Canada.

The events have been run off by Cranwell who are now awaiting comparison with the other Colleges.

British Pilots for the Hedjaz.

The Daily Telegraph of Sept. 27 states:—

King Ibn Saud is now negotiating for the engagement of six British pilots to form the nucleus of an Air Force in the Hedjaz.

Various proposals have been under consideration at different times during the past four years for the engagement of pilots who have completed their service in the R.A.F., says Reuter. For some time King Ibn Saud, it is understood, has been anxious to make use of British material and to employ British pilots, but up till now the terms of the contract offered have not proved altogether satisfactory.

If the present negotiations are successful and the contract terms approved, it is probable that the chosen pilots will leave England shortly to take up their new duties.

The Royal Aeronautical Society, Halton Branch.

A meeting of the Council of the Halton Branch of the Royal Aeronautical Society was held on July 10 when the following Aircraft Apprentices were elected as Students:—H. G. Buck, R. E. Drake, H. B. Sherman, C. Williamson.

Between 400 and 500 Members of the Branch attended the two excursions to Gosport for the Schneider Trophy Contest.

Owing to the passing out of the 14th Entry, six new members are required for the Committee from No. 1 Wing.

The total membership of the Branch is now nearly 1,000 as 480 new members joined in June and July.

The President of the Branch is Air Cmdre. I. M. Bonham-Carter, C.B., O.B.E., and the Hon. Secretary and Treasurer is Mr. C. H. Latimer-Needham, M.Sc., F.R.Ae.S.

The R.A.F. Rugby Union.

The 1929-30 Committee of the R.A.F. Rugby Union has been formed under the chairmanship of Air Commodore A. D. Warrington-Morris, C.M.G., O.B.E., who is also the R.A.F. Representative on the Rugby Union Committee.

The Treasurer is again Wing Cdr. W. C. Hicks, A.F.C. The new Secretary is Flt. Lt. James Lawson, R.A.F., Worthy Down.

Flg. Off. G. R. Beamish will again act as Captain of the team, with Flt. Lt. R. V. M. Odbert as Vice-Captain.

The Representative of the Northern Units is Flt. Lt. J. S. Chick, M.C., A.F.C., and the Representative of the Southern Units is Flt. Lt. J. Lawson.

The match against the Royal Navy will be played at Twickenham on Feb. 8 and the match against the Army at Twickenham on Mar. 22.

The fixtures for the 1929-30 season are:—

Jan. 4, The Police, at Imber Court. Jan. 18, Bristol, at Bristol. Jan. 22, Cambridge University, at Cambridge. Jan. 25, Northampton, at Northampton. Jan. 30, Leicester, at Leicester.

Feb. 1, Bedford, at Bedford. Feb. 8, Royal Navy, at Twickenham. Feb. 12, Middlesex. Feb. 26, Oxford University, at Halton.

March 8, Coventry, at Coventry. March 12, Civil Service, at Halton. March 22, The Army, at Twickenham.

The R.A.F. Golf Championship.

The annual championship meeting of the R.A.F. Officers' Golfing Association opened at Sunningdale, on Sept. 24, when 22 competitors took part in the 36 holes stroke test from which 8 qualify for match play for the championship.

The leader at the end of the day's play was Sq. Ldr. C. H. Hayward, who has won the championship six times. His score of 148 led the field by 13 strokes.

Those who qualified were:—

Sq. Ldr. C. H. Hayward Old 76, +New 72, =Total 148; Flt. Lt. Davidson 78, +83, = 161; Flg. Off. Campbell 82, +82, =164; Sq. Ldr. Barr-Sim 82, +84, =166; Sq. Ldr. Brown 88, +86, =174; Grp. Capt. Briggs 90, +85, =175; Sq. Ldr. Parr 88, +87, =175; Flt. Lt. McFadyen 86, +91, =177.

Grp. Capt. the Prince of Wales on Monday won the nine holes second division handicap with a return of 45 — 6 = 39.

The results were:—

R.A.F. Championship.—First Round.—Flg. Off. Campbell beat Flt. Lt. McFadyen by 7 and 6; Sq. Ldr. C. H. Hayward beat Flt. Lt. Davidson at the 19th hole; Sq. Ldr. C. V. Parr beat Sq. Ldr. Barr-Sim at the 19th hole; Grp. Capt. E. L. Briggs beat Sq. Ldr. A. J. Brown by 2 and 1. *Second Round.*—Hayward beat Campbell at the 19th hole. Parr beat Briggs by 2 up.

36 *Holes Scratch.*—Sq. Ldr. C. H. Hayward, 76+72=148.

18 *Holes Scratch.*—Grp. Capt. Peel Ross, 80.

36 *Holes Handicap.—First Division.*—Flt. Lt. C. R. Davidson (6), 149 net. *Second Division.*—Grp. Capt. Burnett (18), 161 net.

18 *Holes Handicap.—First Division.*—Sq. Ldr. A. Lees, 80 — 8=72. *Second Division.*—Grp. Capt. Burnett, 96 — 18=78. 9 *Holes: First Division.*—Flg. Off. Campbell, 38 — 3=35. *Second Division.*—Grp. Capt. the Prince of Wales, 45 — 6=39.

Bogey.—First Division.—Wing Cdr. Gaskell Blackburn (10), 2 up, after a tie with Flt. Lt. Davidson (6). *Second Division.*—Flg. Off. Harris (15), 2 down.

The championship was won for the seventh time by Sq. Ldr. C. H. Hayward, who beat Sq. Ldr. Parr by 7 up and 6 to play in the 36 holes final.

The results were:—

Championship.—Final.—Sq. Ldr. C. H. Hayward beat Sq. Ldr. Parr, 7 and 6.

Scratch.—Sq. Ldr. Hayward, 77.

Handicap.—1st Division.—Sq. Ldr. Barr-Sim, 78, scr., and Sq. Ldr. Fawcus, 78, scr., tied. *2nd Division.*—Flg. Off. Harris, 87 less 15—72; the Prince of Wales, 87 less 12—75. 9 *holes: 1st Division.*—Flt. Lt. McFadyen, 37 less 3—34. *2nd Division.*—Flg. Off. Harris, 39 less 7½—31½. The Prince of Wales, 42 less 6—36.

Bogey Fourball Competition.—Sq. Ldr. Brown and Flt. Lt. Mackay tied with Flt. Lt. McFadyen and Flt. Lt. Bett, 7 up.

Medal Foursomes.—The Prince of Wales and Sq. Ldr. D. S. Don, 89 less 14—75; Sq. Ldr. Fawcus and Sq. Ldr. Lees, 81 less 4—77.

The Penalty of Fame.

The latest addition to Madame Tussaud's is a waxen effigy of Flg. Off. H. R. D. Waghorn, A.F.C., R.A.F. For the edification of the unknowing it may be said that Madame Tussaud's is a permanent exhibition of waxworks perpetuating the fame of all well-known personalities, be they Makers of History, Builders of Empire, or Murderers of Mankind.

Coupled with this event may be taken the strange disappearance from the upper lip of one of the personalities of a well-known producer of high-speed aircraft a moustache of a singularly becoming type. Although of recent growth it proved amenable to discipline and rapidly took on the shape that is now regarded as one of the strongest qualifications for entry into the most exclusive branch of the British Army. Rumour had it that domestic opposition, coupled with the undesirability of wearing such a military accessory with marine headgear, resulted in the owner selling it to the above institution, such as one sells one's body to a hospital—with the ultimate object of enlightening the coming generation. Can it be that the above self-sacrifice has so soon provided the late owner with an anonymous right to a minute portion of a niche in the Temple of Fame. Truly a peculiar coincidence.—L. B.

CIRRUS ENGINE

500 HOURS ON ACTUAL SERVICE.

ROUND AUSTRALIA WITH A CIRRUS

Extract from Melbourne Evening Paper, 20.8.29.

EFFICIENT LIGHT ENGINE.

The mechanical efficiency of the modern aero engine was demonstrated recently when a Mark II CIRRUS engine belonging to Air Travel Limited, Sydney, was dismantled before 20 pilots.

After 500 hours' flying service, the cylinders and bearings were in excellent condition and piston heads showed hardly a trace of carbon.

The crank case oil strainer was also free from sludge.

and so does this

Extract from Capt. The Hon. H. Grosvenor's letter.

"By the way, I had my CIRRUS II down the other day for the first time since its trip round Australia, since when it has had a fair amount of work, and we were amazed at its condition.

"The Bearings are still almost on the tight side and impossible to touch, and bar a few Rocker Arm Bushes it is as good as new. I will in all probability fit new Rings though."

CIRRUS SUPREMACY IS FOUNDED UPON CIRRUS PERFORMANCE.

AIR DEFENCE.

[*Air Defence.* By Major-General E. B. Ashmore. Longmans, Green and Co. The Aeroplane Book Dept., Cannon House, Pilgrim Street, E.C.4. 8s. 6d. net.]

When the Great War began each of the great Powers possessed flying services, the most elaborate of which was that of Germany. She had 232 aeroplanes, all of them of advanced types. The knowledge of the existence of these machines and of the scheme of rapid development adopted by the German Government did not induce the British authorities to make any serious preparations to resist air attack in the case of war and in August, 1914, a system of air defence had to be improvised from the few inefficient aeroplanes left in the country and from a few guns specially unsuitable for their new purpose. Two ammunition stores were guarded by 6 in. howitzers, "a most unsuitable weapon for air defence." Major-General Ashmore's description of the defence in this early period is pathetically amusing. There were guns which drove about the streets during a raid, searchlights which revealed vulnerable points and helped neither pilots nor guns and there were a few relatively inefficient aeroplanes which were taken up casually by the pilots and not in conformity with any general scheme of air defence.

Nothing effective was done until the War Office undertook, in the spring of 1916, the responsibility for air defence. Thenceforward progress was fairly rapid. A proper warning system was devised and guns suitable for air defence were installed. Cordons of observers were set up over the greater part of the country. These cordons were at first manned by soldiers who, by reason of wounds or ill-health, were unfit for service in the field. General Ashmore is a little unjust to these early observers whom, he thinks, failed from inadequate supervision. When he organised the London Air Defence Area in 1917 the cordons had been greatly reduced for reasons of economy, but they still provided the most accurate of the information received always excepting that which came direct from gun and light stations.

General Ashmore describes clearly and simply the development of the air defences and the manner in which they overcame the raiding airships. This menace once ended there was some relaxation in the defence system. The lack of aeroplanes oversea caused the withdrawal of many machines employed on home defence and the number of guns ordered for anti-aircraft work was reduced by the seizure of nearly half the number by the Admiralty. But the principal deficiency was a lack of fighting organisation. There were no proper patrol areas for aircraft and in their search for the enemy they were exposed to the fire of the anti-aircraft guns. Thus when the first aeroplane raids were made in May, June and July the enemy pilots had a relatively easy task. In the raid of June 13, 1917, there were 594 casualties, "far the largest in any individual raid during the war, the nearest approach being the 286 killed and wounded in the 25th May attack on Folkestone." "The great principle of air defence was not yet sufficiently recognised: that although aeroplanes are the first means of defence, they are ineffective unless supported by a control system on the ground."

As a result of popular clamour the London Air Defence Area was brought into being at the end of July, 1917, and for the first time there was definite unity in the defence system. The A.A. branch of the Headquarter Staff, Home Forces, were loath to relinquish their powers. General Ashmore says:—

> For instance, I had ideas of my own as to the best place for the mobile anti-aircraft guns outside London, and I settled to move them accordingly. The anti-aircraft branch of the staff considered that they could not prevent me moving the guns as I wished, but they proposed to checkmate me by refusing to provide the necessary telephone communications for the new positions. Again during the raid of August 22, the guns had used a new method of observing height and controlling fire. It was to a great extent due to this method that such excellent results were obtained. The Headquarter Staff thereupon asked me by whose authority I had dared to introduce such a novelty. The answer was, "By my authority." But I was able to add that the method had been invented and practised under their own auspices before I arrived. When the night raiding began, and we devised the barrage system—that afterwards became an essential factor in the defence—I was forbidden to use it.

But with the support of Lord French these difficulties were soon overcome and the groundwork of the organisation which survives, in the main, to this day was speedily laid down. There was the introduction of night flying on scouts, an introduction for which Major Murlis-Green, Lieutenant C. C. Banks and Captain Brand were responsible. The earlier idea had been to use Handley Pages, singularly unsuitable machines for the purpose. The balloon aprons—each of three Cacqout balloons linked to a cable from which depended a series of wire streamers—served to keep the enemy at a respectful height and so narrowed the zone in which our pilots had to work. Proper patrol areas were arranged and surrounding London there was a barrier of guns each employing a newly-devised system of box barrages. There was, moreover, a well-co-ordinated system of central control which, however, did not repress the initiative of the subordinate commanders. The section of the book in which these developments are described has special interest as they were the sources of the system at present in use.

We know the results of the reorganisation. Serious raiding stopped after May, 1918, which was a pity as a further development of the control system was never tested under warlike conditions. After the Armistice had ended hostilities the air defence system was allowed to fall to pieces in spite of the protests of those who knew what reconstruction at a later date would cost and it was not until 1924 that there was any revival of official interest in air defence. General Ashmore would like the Air Ministry to take over complete control of all units engaged in air defence. He sees a "fundamental weakness" in the divided responsibility between the War Office and Air Ministry. He thinks that the Territorial ground units engaged in air defence should be handed over to the Air Ministry and be administered as are the Territorial squadrons of the Royal Air Force. He speaks warningly of the present deficiency in communications. "So far we have only made a beginning; perhaps a fifth of the Observer Corps communications and one-tenth of the searchlight communications; none at all as yet at gun stations." These communications cannot be improvised hastily. In regard to the future he has no belief in counter-bombing as a means of defence. He says:—

> . . . . are we to wait until London has been bombed before we launch our counter-bombing offensive-defensive? It must be remembered that in air attack the maximum strength can be developed at the outset; this first blow on London may be on a vast scale. How long will it take our counter-bombing to produce its effect, and stop the attacks on London. Weeks, certainly; months, perhaps. The enemy's aerodromes will presumably be known to us, but what if he is cunning enough to arrange new jumping-off places, prepared beforehand in secret? They may not be easy to find. No! London would suffer terribly, perhaps intolerably, long before any counter-bombing could save her.

So far General Ashmore's book is the only work of value in the matter of air defence. He might have written at twice the length with advantage. An unofficial textbook is necessary and had there been less compression in "Air Defence" it might have filled the gap. As it is General Ashmore has made an interesting addition to the history and the theory of air defence.—W.

A PILLAR OF CLOUD BY DAY.

The Berlin correspondent of *The Times* reports the extensive trials at Travemünde on Sept. 17 of smoke-screens as a means of defence against attacks from the air.

The tests, which were observed from the air by seven machines including the Rohrbach Romar (which is certainly acquiring publicity nowadays), were announced to be entirely satisfactory.

That may be, but R/T and W/T have been developed intensively of late years. As a result blindly-flown aircraft can be guided by R/T or W/T right onto their target and told to drop their lethal bouquets.

One also knows, on good authority, that the French have succeeded in despatching a wirelessly-controlled aeroplane with no crew aboard from an aerodrome. This machine was guided to its destination, and its bombs were dropped in that vicinity by wireless control, and the machine was then brought safely home. As a matter of fact the bombs were dropped a mile wide of the mark, still the Zeppelins did no better during 1914-18.

Also, passengers on the Cairo-Karachi route have stories of a crewless, wirelessly-controlled machine, which has done a large amount of flying over Arabia.

Furthermore smoke-screens are just as useful for blinding the defence as they are for blinding the attack.

THE NEXT EXAMINATION FOR AIR NAVIGATORS.

Air Ministry Notice to Airmen No. 57 of the year 1929 states that the examination for 1st and 2nd Class Air Navigators' Licences will be held at the Air Ministry, Gwydyr House, Whitehall, on Monday, Tuesday and Wednesday, Oct. 14 to 16, 1929. An examination for 2nd Class Licences only will be held on the same date at the office of the Air Ministry Representative, Heliopolis Aerodrome, Cairo.

Candidates for the 1st Class licence will also be required to attend at Croydon Aerodrome on Thursday, Oct. 17, 1929, for a practical examination in meteorology.

The fees remain at 5s. for both classes of candidates.

Application forms, syllabi, and conditions of examination can be obtained on application to the Secretary, Air Ministry (C.A.2), Gwydyr House, Whitehall, S.W.1.

"Bristol"

MILITARY & CIVIL AIRCRAFT CONSTRUCTION.

For more than ten years the Bristol Aeroplane Company have pursued a policy of diligent research and experiment in the matter of metal aircraft construction. The result of this work is displayed in the "Bristol" Bulldog and other "Bristol" types. High tensile steel is used for all load carrying members of the structure, and the method of manufacture and assembly of the built up high tensile steel strip units is such that lightness, strength and rigidity are obtained, together with the utmost simplicity and ease of maintenance and repair.

SOME RECENT AMERICAN SERVICE AIRCRAFT.

AIR-COOLED.—The Curtiss Hawk (XP-3A) single-seat fighter biplane (425 h.p. Pratt and Whitney Wasp engine) with the new N.A.C.A. cowling.

The accompanying photographs illustrate several types of recent American fighter aircraft.

The Curtiss Hawk (P1-C) is one of the two standard single-seat fighters of the U.S. Air Corps. The other is the Boeing PW-9, which is also fitted with the Curtiss D-12 water-cooled engine. These are the only two types of pursuit-aircraft with water-cooled engines now in standard use in the American Services.

The Curtiss XP-3A is an experimental Army type with the 475 h.p. Pratt and Whitney Wasp air-cooled radial engine and the new N.A.C.A. low-drag cowling. No performance figures of this type are available, but judging from the photograph it would appear that what advantage might be gained in speed would be destroyed by the lack of good visibility forward, one of the most important qualities of the single-seat fighter.

With the advent of ethylene-glycol cooling-fluid, commonly called "Prestone," which enables the radiator surface to be reduced to one-fourth the size required for normal water-cooling, the water-cooled engine becomes again a rival to the air-cooled engine in-so-far as frontal area is concerned.

In addition to the fact that the radiator resistance is cut to a fraction of its former value, something like 100 lbs. is saved in weight, and the speed of the machine is increased by as much as 11 or 12 m.p.h. By the use of small wing radiators in place of the one-fourth size frontal radiator the speed is increased by 15 m.p.h.

In tests with a Curtiss Hawk fitted with a Curtiss D-12 engine and using "Prestone" fluid (which boils at 387 degrees Fahrenheit) in a radiator somewhat larger than the computations indicated as necessary, the maximum temperature of the cooling liquid was recorded as 270 degrees Fahrenheit. This occurred after ten minutes of full throttle operation at 2,000 ft. The machine, relieved of 90 lbs. weight of radiator and cooling liquid, was reported to possess better flying qualities than previously.

The Curtiss F7C-1 and XF8C-2 are designed to U.S. Navy specifications for single- and two-seat ship-board fighters respectively.

The Hall XFH-1 is also a single-seat ship-board fighter, but this machine embodies a watertight fuselage and a droppable undercarriage to enable the machine to alight in the sea without total loss. This idea follows the French precedent for ship-board aircraft, as developed principally by the Levasseur Company.

The Curtiss P1-C "Hawk."

Type.—Single-seat military pursuit biplane.

Wings.—Single-bay, staggered, unequal-span biplane. The wings are tapered in plan form and are built up of wooden spars and ribs, covered with fabric. One set of "N" type splayed-out streamline steel-tube interplane struts on either side of the fuselage. Ailerons fitted to top plane only and are of metal construction, covered with fabric. Ailerons operated through positive push-pull rods, adjustable to permit of various degrees of differential or synchronous aileron motion.

Fuselage.—Welded steel-tube structure, covered with fabric.

Tail Unit.—Normal type. Metal framed, covered with fabric. Tail controls are cable-operated, with a differential action incorporated in the elevator controls.

WATER-COOLED.—The Curtiss Hawk (P-1C) single-seat fighter biplane (435 h.p. Curtiss D-12 engine) which is one of the standard pursuit biplanes of the U.S. Army Air Corps.

AN AMERICAN SINGLE-SEAT SHIP-PLANE.—The Curtiss Sea-Hawk (F7C-1) single-seat fighter ship-plane (425 h.p. Pratt and Whitney Wasp engine) which forms part of the carrier equipment of the U.S. Navy.

Undercarriage.—Split type. Consists of two Vees hinged on the bottom fuselage longerons and two bent axles crossing at the centre. Suspension by rubber compression discs, housed within the fuselage. Steerable tail-skid sprung by rubber compression discs. Interchangeable wheels and skis.

Power Plant.—One 435 h.p. Curtiss D-12 water-cooled engine on a detachable welded steel-tube mounting. The water system incorporates a tunnel radiator. Auxiliary fuel tank carried under fuselage, behind tunnel radiator, and is droppable in case of emergency. Curtiss-Reed duralumin airscrew.

Accommodation.—Pilot's cockpit aft of top plane. Armament consists of two fixed Browning guns, firing through airscrew, and provision is made for carrying small fragmentation bombs for ground attack work. Equipment includes regulation Army parachute and oxygen equipment.

Dimensions.—Span 31 ft. 6 in. (9.6 m.), Length 23 ft. (7.01 m.), Height 8 ft. 9 in. (2.67 m.), Wing area 252 sq. ft. (23.4 sq. m.).

Weights and Loadings.—Weight empty (with water) 2,195 lbs. (998 kg.), Weight of crew 200 lbs. (90.6 kg.), Weight of fuel and oil 330 lbs. (149.6 kg.), Weight of equipment 27 lbs. (12.2 kg.), Total disposable load 765 lbs. (347 kg.), Weight loaded 2,960 lbs. (1,345 kg.), Wing loading 11.74 lbs./sq. ft. (57.4 kg./sq. m.), Power loading 6.8 lbs./h.p. (3.08 kg./h.p.).

Performance.—Maximum speed 165 m.p.h. (266 km.h.), Speed at 15,000 ft. (4,570 m.), 154.5 m.p.h. (249 km.h.), Landing speed 58.7 m.p.h. (85 km.h.), Initial rate of climb 1,800 ft./min. (548 m./min.), Climb in 10 mins 12,350 ft. (3,762 m.), Service ceiling 21,000 ft. (6,398 m.), Absolute ceiling 22,150 ft. (6,750 m.).

The Curtiss F7C-1 "Sea Hawk."

The Curtiss F7C-1 is a single-seat ship-board fighter, fitted with the 425 h.p. Pratt and Whitney Wasp engine. It differs in many features from the standard "Hawk," particularly with regard to arrangement of wings, undercarriage and general equipment.

Type.—Single-seat naval shipboard fighter.

Wings.—Unequal span staggered biplane. Top planes have 7 degrees of sweepback outside the centre-section. Bottom planes are straight. Centre-section is mounted above fuselage on widely-splayed "N" type steel-tube struts. One pair of splayed "N" type steel-tube interplane struts on either side of fuselage. Ailerons on inset hinges on top planes only. Wings of Curtiss C-72 section, of wooden construction, with spruce box spars and ribs, covered with fabric.

Fuselage.—Constructed of riveted steel and duralumin tubing, with steel fittings, and is designed for catapult and deck-landing loads.

Tail Unit.—Normal type. Metal-framed, covered with fabric. Balanced rudder. Adjustable tail-plane.

Undercarriage.—Split type. Consists of two Vees hinged to bottom fuselage longerons and two half-axles hinged to a Vee cabane under fuselage. The shock-absorbing medium in front legs of Vees is a combination of a two-cylinder oleo gear and rubber discs. Hydraulically operated wheel brake-shoes bear on the inner surface of the wheel rims. Entire undercarriage may be replaced by a single central float and two wing-tip floats, and the machine can be catapulted with either type of landing gear.

Power Plant.—One 425 h.p. Pratt and Whitney Wasp air-cooled radial engine. Main petrol tank, carried in fuselage, is fitted with dumping valve, to lighten machine and provide extra buoyancy in event of forced landing in the sea.

Accommodation.—Pilot's cockpit in rear of trailing-edge of top plane. Pilot's seat is provided with 11 ins. up-and-down adjustment, and rudder pedals slide back and forth in conjunction with seat. In turtle-deck, behind cockpit, is carried a pneumatic life-raft which

AN AMERICAN TWO-SEAT SHIP-PLANE.—The Curtiss XF8C-2, an experimental two-seat fighter ship-plane (450 h.p. Pratt and Whitney Wasp engine), which is now being tested in the U.S. Navy.

AN AMERICAN SINGLE-SEAT SHIP-PLANE.—The Hall XFH-1 all-metal single-seat ship-plane (425 h.p. Pratt and Whitney Wasp engine) built by the Hall-Aluminium Aircraft Corpn. of Buffalo, N.Y. It has a water-tight fuselage and a droppable undercarriage for emergency alighting on the sea.

can be inflated in a few seconds with carbon dioxide. All petrol pipe lines kept outside pilot's cockpit and pressure fire-extinguisher carried in engine compartment.

No dimensions or performance figures are available.

Curtiss XF8C-2.

The Curtiss XF8C-2 is an experimental two-seater ship-board fighter equipped with a 450 h.p. Pratt and Whitney Wasp engine. Though resembling the Curtiss Falcon in appearance, it possesses many of the characteristics of the lighter, single-seater fighters.

Type.—Two-seater ship-board fighter.

Wings.—Equal-span, staggered biplane. Upper wing has 12° of sweep-back. Bottom wings are straight. Centre-section is mounted above fuselage on widely-splayed "N" type duralumin tube struts. Interplane bracing consists of one pair of "N" type struts in either side of fuselage. Wings are of wooden construction, employing C-72 airfoil section, with spruce box-spars, wood ribs, and fabric covering. Wing-bracing consists of double flying wires and single landing wires. Lower ailerons are balanced.

Fuselage.—Constructed of steel and duralumin tubing, with Warren-truss bracing.

Tail Unit.—Normal type. All-duralumin construction, fabric-covered. Rudder balanced. Horizontal stabiliser adjustable in flight, vertical stabiliser adjustable on ground.

Undercarriage.—Split type. Consists of two Vees, the front leg of each incorporating an oleo and spring shock-absorber. The rear legs of each Vee hinges to the lower longerons. Two radius-rods hinge to an attachment on the under side of the fuselage in line with the Vee hinges.

Power Plant.—One 450 h.p. Pratt and Whitney Wasp engine. Fuel is carried in two tanks, one in either side of fuselage, aft of firewall.

Accommodation.—Two seats for pilot and gunner arranged in tandem aft of upper wing. Flotation bags, which can be inflated with carbon dioxide in a few seconds, are carried in canvas packs on either side of fuselage, and provide ample buoyancy to keep plane afloat in event of a forced landing in the sea.

Dimensions.—Span 32 ft. (9.75 m.), Length 25 ft. 4½ in. (7.75 m.).

Weights.—Weight empty 2,515 lbs. (1,140 kg.), Weight loaded 4,191 lbs. (1,900 kg.).

Performance.—Maximum speed 136 m.p.h. (219 km.h.), Cruising speed 109 m.p.h. (175 km.h.), Stalling speed 61.8 m.p.h. (99.5 km.h.), Initial rate of climb 1,000 ft./min. (305 m./min.), Service ceiling 16,400 ft. (5,000 m.).

The Hall XFH-1 Biplane.

The XFH-1 has been built by the Hall Aluminium Aircraft Co. of Buffalo, N.Y., in co-operation with the Bureau of Aeronautics, U.S. Navy Department.

This machine embodies a watertight fuselage, which affords sufficient flotation in an emergency landing and ensures that the machine would remain afloat during a period sufficient to allow the rescue of the pilot and the salving of the machine, and the undercarriage is droppable.

The fuselage of the XFH-1 is an aluminium monocoque built up of frames and stringers and is covered with sheet. All material used is "Alclad." Watertight bulkheads and buoyancy tanks are built in in such a manner as not to diminish the aerodynamic qualities and are so located that flotation at reasonable trim is assured.

The engine is a 425 h.p. Pratt and Whitney Wasp air-cooled radial.

The machine carries the full useful load and overload of the standard single-seat ship-board fighter, and equipment includes deck-landing gear, bomb gear, fixed armament consisting of two guns, oxygen equipment, etc.

SIGHT-SEEING BY ZEPPELIN.

On Sept. 28 the *Graf Zeppelin* took 32 passengers for a trip over Switzerland. The route was from Friedrichshafen to Berne, then over the Bernese Oberland and twice round the Jungfrau. Thereafter the airship returned safely to Friedrichshafen.

THE VICTORS.—Mr. Hubert Broad and his mechanic, Mr. Weedon, standing in front of the Super Coupé Moth in which they covered the Zenith Trophy circuit of 1,044 miles round France at an average speed, including compulsory stops, of 113 m.p.h. They have, subject to homologation, been awarded the Trophy.

PRIVATE FLYING IN THE UNITED STATES.

Messrs. Dominick and Dominick, of the New York Stock Exchange, make some interesting statements in a bulletin which they issue periodically. These read as follows:—

The United States not only has more airplanes in operation than any other country in the world, but the 1928 American production was greater than all the rest of the world combined. At the same time, the comparative smallness of the aircraft output is indicated by the fact that while automobile registrations in America total some 24,000,000, the number of airplanes licensed by the Department of Commerce to date amounts to only 6,254. Somewhere between these two figures lies the enormous market for aircraft which is the basis of the Industry's future.

Last year private capital came into the Industry in abundance for the first time and air transport demonstrated that it could be profitable without subsidy. Production of airplanes increased about 300 per cent. as compared with the figures for 1927 and was variously estimated at around 4,500 airplanes and 3,500 engines, with a total value of $75,000,000.

Of the 25 companies manufacturing commercial engines, however, 4 companies produced 75 per cent. of this total, and of the 45 active airplane manufacturers about 11 companies accounted for the same proportion. A high degree of concentration had already taken place in the Industry, therefore, and this condition has been accentuated this year. year.

It is evident that the production of airplanes for 1929 will be considerably less than previous forecasts and is now estimated at about 7,000 instead of 10,000 and 12,000. The restriction of manufacture to this figure would make it extremely difficult for many of the smaller manufacturers to survive.

The situation gives added point to the consolidations and mergers which have been a feature of the Industry in the past 18 months. We have witnessed the formations of several groups dominating the Industry and combining under their control all the various departments of aviation, including air transport as well as aircraft manufacture. Of these, the two largest, the Curtiss-Wright group and the United Aircraft and Transport Company, are fairly typical of the effort to bring all the functions of aviation under one control.

Doubtless these mergers will continue, and we shall witness in the next few months a re-adjustment of the aviation business which will result in the elimination of many of the small manufacturers by absorption into larger units or otherwise. The uncertain factor of the Industry, therefore, is found among the small and weakly financed companies accounting for a limited and scattered production.

With this warning in mind we can anticipate a profitable and active future for the carefully organised and strongly financed companies.

[There is, however, the other view that every firm which disappears, by being swallowed in a merger, leaves room for a new small firm to make a start,—and if the small firm can deliver the goods, and can produce new designs of types which catch the fancy of buyers, it will get all the business it wants.—C. G. G.]

AN INQUEST AT GREENWICH.

On Sept. 25, an inquest was held at Greenwich on the body of Mr. Arthur Norman Brunning, who was killed when the machine, in which he and Mr. S. U. Annis were flying, crashed close to the Sidcup by-pass road at Welling, near Woolwich, on Sept. 19.

Mr. Annis was severely injured, and at the time of the inquest he was still in hospital.

Mr. Grant stated that no application had been made to the inquest that Mr. Brunning had passed his "A" licence test, and that he had, Mr. Grant believed, obtained a licence. Mr. Annis, who had been in the R.A.F. during the War 1914-1918 and was doing a "refresher" course, had taken this particular machine up for a solo flight in the morning.

Mr. Grant stated that the application had been made to him for the machine to be taken up in the afternoon and that his permission for the flight had not been obtained.

From a statement made by Mr. Annis, and read at the inquest, Mr. Brunning appears to have fainted or had a fit after putting the machine into a dive, and then fallen onto the control column. Mr. Annis had no time to attempt to regain control.

The jury returned a verdict of "Death from accidental causes," and added a rider to the effect that more care should be taken on the aerodrome to prevent pilots taking machines up without permission.

FALSE ECONOMY.

The air mail due to leave Karachi for England on Sept. 29 was unable to start for the very good reason that no suitable machine was available.

The recent disaster at Jask, when one of Imperial Airways machines was destroyed, has made the working of a shuttle service necessary. As the outgoing mail to Karachi has been held up by sandstorms in 'Iraq the home mail will have to wait at Karachi until the arrival of this machine.

PERCY PILCHER.

[From a Correspondent.]

At a time when aviation looms so large in the public eye, we are apt to forget the pioneers of this new mode of travel, and to have no thought for the memory of those who give their lives to the cause. Therefore, it is well to record that Sept. 30 was the anniversary of an experiment in an aerial machine, in Stanford Park, near Rugby, in 1899, which had a tragic issue.

The victim was Percy Pilcher, R.N. His prediction of great things for the flying machine has been more than realised.

On several occasions previously he had made successful flights over the same ground. This day there was a distinguished house party at Stanford Hall, including Mr. Henniker Heaton, M.P., and in the afternoon they proceeded to the Park to witness the tests. While in mid-air a cross-bar of the machine broke, allowing the wings to fold up, and the whole thing collapsed.

Lieut. Pilcher was badly injured, and died a couple of days later.

At the inquest the Hon. Adrian Verney-Cave (the present Lord Braye) said that at the time there was a strong wind blowing, but this he considered was rather an advantage than otherwise, because without it the machine could not have risen.

The object of the experiments was to obtain control over the machine in mid-air. It was raised by means of a rope drawn by men and horses, and it was the intention of Lieut. Pilcher, when he attained his object, to apply a specially constructed oil motor to propel the machine.

Lord Braye (father of the previous witness) mentioned that he was averse to the experiment being made that day, but Lieut. Pilcher was anxious that the trial should take place, as Mr. Henniker Heaton was present and was most interested in the machine.

The jury returned a verdict of "Accidental death."

The memorial shown in the accompanying picture was subsequently erected by the late Lord Braye on the identical spot where Lieut. Pilcher fell with his machine.

The inscription on the front reads: "Percy Pilcher, Pioneer of Aviation, fell here, Sept. 30, 1899." On the reverse side: "Icaro alteri."

The Pilcher Memorial at Stanford Park, near Rugby.

ON THE TURN.—A striking view of the Hawker Hurricane. The

THE LIGHT AEROPLANE AND THE FLYING CLUBS.

THE NORTHAMPTONSHIRE AERO CLUB MEETING.

In spite of the advantages of good weather and a large tendance of visiting pilots, the third flying meeting of the orthamptonshire Aero Club, at Sywell Aerodrome, on Sept. , was distinctly disappointing.

A number of visiting aircraft arrived overnight, and more w over during the morning and early afternoon.

Among the visitors were some of the band of flying sports-en and sportswomen whom one meets at practically every ub display, and two or three came over without their achines.

Among the former were Mr. Talbot-Lehmann in the N.F.S. artan, Mr. Wheatley in the Golden Shell Moth, and Mr. uilter, Mr. Murray, Mr. Grey, the Hon. Lady Bailey, and r. Malcolm in their Gipsy Moths. To this list must be ided the indefatigable Mr. Parkhouse, of Teignmouth, who yally supports these flying meetings. Of those who arrived ithout mounts were Flt. Lt. T. Rose, Mr. Cazalet, and Flt. t. La Poer Trench.

Sir Sefton Brancker also flew down in his Moth, EDCA, iloted by Mr. Campbell.

In addition to the influx of private owners, the Club was onoured by a contingent from the Central Flying School, Vittering, consisting of two R.A.F. Genet Moths and three ynx-Avros.

According to the programme, Flg. Off. Atcherley was have given a "demonstration of flying as it should be one," but he sent word regretting his inability to attend he meeting.

The programme opened at 14.30 hours with a landing ompetition, which was won by Flg. Off. Johnson, of the Central Flying School, with a distance of 4 feet to his redit.

With all due respect to the organisers of the display, the nly outstanding event of the afternoon was then given y Flt. Lt. Wiblin and Flg. Off. Johnson on the Genet Moths. One has seen many demonstrations given by the C.F.S. Moths, but the performance at Sywell was well up to anything yet done. Their inverted flying and slow rolls across the aerodrome at a low height was a treat to watch, and a comic touch was added by one of the pilots hedge-hopping over the enclosures and blowing a small hooter.

The next event was described as a novelty race for "B" Licence pilots only. Each pilot was provided with a lady passenger, who first had to knock over three beer-bottles with tennis-balls. Her pilot had to thread a needle, and both had then to run to their machine, take off, and fly round Sywell Reservoir. Returning to the aerodrome, the pilot had to land, taxi to a given line, and then fold his wings. After all this, his passenger had to run to the Official Car.

This event was run off in two heats, and the final provided a thrill. The participants were Mr. H. Davis, of the Brooklands Flying School, and Flt. Lt. T. Rose, on one of the Club's Moths. Mr. Davis got away first, but was hotly pursued by Flt. Lt. Rose. The machines landed almost simultaneously, but Mr. Rose got his wings folded first, and his passenger, Miss Harris, reached the Official Car and was declared the winner.

The two Genet Moths then went up and repeated their fine performance. Next followed the usual car-bombing and balloon-bursting events.

During the afternoon, joy-rides were given by one of the Brooklands Flying School Avros, which was well patronised.

The attendance was not very good, although there was a large number of cars, mostly in the members' enclosure.

In the evening, a dinner was given for the visiting pilots at the Grand Hotel, Northampton.

A fault one has to find with this show, and one which seems to prevail at most flying meetings, is the long wait between events. The situation was certainly saved by the C.F.S. Moths. There is also too much sameness in the programmes. One suggests that the secretaries of the flying clubs should get together and plan out a campaign for their meetings next year.—M. S.

THE ENGINE AND ITS RECORD.—On the left is shown the sealed Gipsy engine immediately on the completion of its 600 hr. test. On the right Mr. Eden is seen painting up the record of hours and miles with, on the extreme left, Mr. Tuck of the Hoyt Metal Co. Ltd., and on the right, Mr. Geoffrey de Havilland, Jr., one of the pilots in the test, looking on.—(*" Aeroplane " photographs.*)

A GREAT RELIABILITY TRIAL.

On Sept. 24, a D.H. Moth G-EBTD, with an 85 h.p. Gipsy engine, completed a 600 hours' Reliability Trial, during which time the engine (which was sealed by the A.I.D.) received no repair work or overhaul whatsoever. The test was made in order to prove that the modern aeroplane engine can be run with even less maintenance than is required for a motor-car engine.

The test began on Dec. 27, 1928. For the whole of the 600 hours, Pratts petrol and Wakefield's oil were used. Before the test began, the engine developed 85 b.h.p. At the conclusion of the test, it was found that at the same r.p.m. (1,900) the power developed had actually increased by 2 horses.

The time in the air was very carefully checked and was actually 600 hours. The time was taken from the moment of leaving the ground to the moment of touching. The time for running-up and taxying and test work was counted separately and totalled 1 hr. 5 mins.

The total amount of petrol used was 2,644½ gallons, which works out at 4½ gallons per flying hour, which is the equivalent of 19 miles per gallon. If the ground time is added this works out at about 4 gallons per hour. The total amount of oil consumed was 294 pints, which is just under ½ pint per hour and is equal to a consumption of 1,400 miles per gallon of oil.

The figure of 600 hours was determined upon at the beginning of the test, and at the conclusion the engine was running so well that the firm were tempted to try for 1,000 hours. However, it was decided to stick to the original figure, which was the objective, for if anything broke, much of the value of the tests would be lost as examination of the engine might have been rendered impossible.

The full A.I.D. report on the engine will be issued in a few days, and the parts of the engine will be available for inspection in the demonstration shed at Stag Lane. In the meantime it can be stated that no parts of the engine are abnormally worn, and there is less than ⅛ inch of carbon on the pistons.

The sparking plugs were K.L.G. Type 294 and the magnetos were B.T.H. The bearings were made by the Hoyt Metal Co. Ltd., of Putney. These bearings show particularly little sign of wear, proving once again the extraordinary suitability and reliability of this metal for engines of any description. The ball bearings were made by Ransome and Marles Ltd., and Skefko Ltd. The piston-rings were by Wellworthy Ltd., the carburettor was a Zenith, the valve springs were by Salter and Co. Ltd., and the gaskets were by Hall and Hall Ltd.

The Moth itself, which must be known by sight to everyone who has visited any of the aviation meetings of the past

600 HOURS.—The D.H. Moth G-EBTD coming in to land on the completion of the 600th hour of the Gipsy Reliability Trial at Stag Lane.—(*" Aeroplane " photograph.*)

year, was originally an X Moth and was intended for the De Havilland School of Flying. Actually it has not done more than a month with the School, for almost as soon as it was built its somewhat chequered career began, and most of its life it has been as a flying test-bed.

The original Gipsy engine which was fitted to the Tiger Moth for the King's Cup Race in August, 1927, was tested in "TD" and also all the first batch of Gipsy engines had their first air test in it. It was the first machine to be fitted with the new split-axle undercarriage. It was on "TD" that this undercarriage was tested to destruction. It will be remembered that during this test Captain Geoffrey De Havilland purposely dropped the machine from a height of 30 feet before it finally broke.

During the 600 hours' test, the machine has been in the care of Mr. A. T. Eden, who has piloted "TD" for a large portion of the 600 hours' flying, and it has also been flown by the majority of pilots at Stag Lane, including Captain Geoffrey De Havilland, Mr. Geoffrey De Havilland, Jr., Mr. Malcolm, Mr. Ballantyne, Mr. Fulford, Mr. Buckingham and several other pilots, so that the engine has not been nursed by any one pilot. It has been used as a sort of hack during this time and has flown all over the country.

The engine was not a special engine, but was a production engine selected at random and is essentially the same as any other Gipsy engine produced. During the whole period, there has been no mechanical trouble or failure of any description and the test definitely establishes the Gipsy in the front rank of the World's light aeroplane engines.

THE BRISTOL AND WESSEX AEROPLANE CLUB.

During the month of September the Bristol Club flew 124 hr. 20 min. with three machines in commission. Of this 76 hr. 10 min. was instructional flying, 15 hr. 45 min. solo flying, 19 hr. 5 min. licensed pilots' flying and 12 hr. 45 min. passenger-carrying flying.

With the deepest regret we have to record a fatal accident involving the death of Mr. E. M. Tiarks and Mr. Edward Somerset, when flying together in Mr. Tiarks' machine on Sept. 23. Mr. Tiarks was a most enthusiastic supporter of the Club and his loss will be very genuinely felt by all our members with whom he was a very general favourite.

On Sept. 22 we held our farewell party, before we move to the new Municipal Aerodrome. It was voted a success, very largely due to all the good friends who came in their machines to see us, to all of whom we offer our most appreciative thanks. Although there had been no advertisement, and the party was by invitation only, there was a large gathering in the public enclosure. The Aeroplane has already given an account of the day, so that it only remains to be said that we intend our first show on the new aerodrome, next Spring, to be a real good one.

Mr. R. A. Rioch, Mr. K. H. Potter, and Mr. D. Finch Hatton passed their "A" Licence tests during the month.

THE LANCASHIRE AERO CLUB.

The total flying hours for the month of September was 98 hrs. 25 mins. Five new members began instruction during this period.

Apart from the Club "At Home," which has already been reported there were no occurrences of outstanding interest until the last week of the month, during which XD sustained serious damage in a crash which occurred while she was being flown over from Woodford to Wythenshawe.

Mr. D. E. Hall, our Chief Instructor, who was piloting from the front seat, suffered a broken knee cap while Ground Engineer Bartram, who was in the back seat, was cut about the face. Their many friends both inside and outside the Club will be glad to hear that they are both making excellent progress.

It will necessarily be a month or two before Mr. Hall can resume his duties and meanwhile Mr. Michelmore, lately an Instructor with the Phillips and Powis School of Flying, at Reading, is taking over his work.

A PLYMOUTH LIGHT AEROPLANE CLUB.

Under the auspices of the Plymouth Chamber of Commerce, the Plymouth Mercantile Association, the Devonport Mercantile Association and the Plymouth Rotary Club, a committee has been formed for the purpose of inaugurating a Light Aeroplane Club for the city. The project has been helped considerably by the fact that the Corporation has decided to purchase the flying ground at Roborough for a municipal aerodrome.

Leading local business men are prominently identified with the movement, and it is confidently expected that within twelve months of the formation of the Club there will be a considerable number of owner-pilots in the district.

A local firm has offered a 20-guinea silver Challenge Cup for competition among the flying members of the Club. The enterprise is being enthusiastically supported, as it is realised that Plymouth, owing to its geographical position, is likely to become one of the most important airports in the country.

CHESTER AND N.F.S.

Although N.F.S. have offered to co-operate with Chester Corporation in the establishment of an aerodrome near Chester the City Fathers have decided to shelve the matter until an Air Ministry representative has visited the city and given his opinion as to suitable sites.

THE SINGAPORE FLYING CLUB.

The flying time of the Singapore Club for the month of July amounted to 49 hours 10 minutes, bringing the total to date up to 594 hours 27 minutes.

On Aug. 3 Mr. R. R. Gardner successfully did his first solo flight.

On Aug. 10 Mr. J. C. Alexander did his first solo.—And in that week the Club put in 13 hr. flying. The next week, owing to bad weather, only 6 hr. 50 min. were done.

Considering that the Club uses seaplane Moths only, and so is dependent on water as well as wind, this is not at all bad going.

AN AUSTRALIAN LIGHT AEROPLANE ENGINE.

The first Australian light aeroplane engine, known as the Harkness "Hornet," has been built, and it has run for many hours on bench tests without showing any signs of the usual teething troubles. The engine should by now have passed its 100-hour type test.

This engine has been designed by Mr. D. Harkness, a motor engineer and racing motorist of some considerable fame in New South Wales, and it has been built by Harkness and Hillier, Ltd., one of the biggest firms of motor engineers in the same State.

It is a four-cylinder in-line vertical air-cooled engine with a bore and stroke of 120 mm. x 130 mm

The four cylinders and the top half of the crank-case are one alloy casting.

The upper or cylinder portion of this casting is heavily finned, and steel liners are inserted.

The cylinder-head is also one alloy casting, and is held down by long holding-down bolts, five on each side, passing through the crankcase portion of the top casting and secured inside.

An overhead camshaft running in oil and driven by a vertical shaft at the back of the engine through bevel gears operates one inlet and one exhaust valve per cylinder.

The lower portion of the crank-case is in two portions. The front portion extends back to the front crankshaft bearing. The rear portion, comprising the sump, can be removed in about five minutes without removing the engine from its bearers.

The crank-shaft is a nickel-chrome steel forging, and runs on five plain bearings carried in the top portion of the crank-case. The connecting rods are of the nickel-chrome steel tubular type as used in the Wolseley Viper engine. The pistons are aluminium alloy castings.

Carburation is by either a Claudel-Hobson or Zenith carburetter.

Two Simms 4-cylinder magnetos are mounted at the back end of the engine, and each fires 4 plugs on each side.

Force-feed lubrication is by a pump, of the positive-vane type, giving a pressure of 60lb./sq. in. Oil is forced to all bearings, and on its return passes through a muff on the induction pipe.

The Hornet weighs about 290lb. and gives 110 h.p. at 2,100 r.p.m., although the normal r.p.m. is 1,800.

It has been designed to fit the standard light aeroplane engine-bearers.

THE HARKNESS HORNET.—The first Australian designed and built light aeroplane engine.

THE SYDNEY—PERTH AIR RACE.

On Sept. 30 the Australian Trans-continental Air Race started from Sydney and is due to finish six days later at Perth, the capital of Western Australia. The distance is 2,290 miles and will be flown in twelve stages, two stages of roughly 200 miles each a day. The route is by way of Sydney, Melbourne, Adelaide, thence round the south coast and inland to Kalgoorlie, and finally to Perth.

Originally there were twenty-seven entries, including thirteen Gipsy-Moths, two Cirrus-Moths, one D.H.50A, one D.H.37, one D.H.9, three Avro Avians, one Klemm monoplane, one Sopwith Gnu, one Simmonds Spartan, one Westland III (known in England as the Widgeon) and two unspecified machines.

Prizes will be awarded for fatest time on handicap and also for speed. For the fastest time on handicap the first prize will be £1,000, second prize will be £300, and the third prize will be £100. For the fastest flying time over complete course the prize will be £300. There is also a £50 prize for the handicap winner of each day's section. The winners of the 1st and 2nd handicap prizes are not eligible for the daily prize, but the winner of the 3rd handicap prize is eligible for four out of the six daily prizes.

The race is open to all aircraft duly registered and certified as airworthy by the Commonwealth authorities at the date of the contest, but such craft must have a minimum safe range in still air of 350 miles.

All competing pilots must hold a pilot's "B" licence issued by the Australian Civil Aviation Branch, but "A" licence pilots may be approved by a committee of the local Aero Club specially for the race. The same number of passengers, or equivalent weight, must be carried throughout the race.

The latest reports at the time of going to press state that there were 17 starters out of the 27 entries, and all these completed the first day's stage to Melbourne. The winner of the daily prize for this section was Mr. Pratt, flying a D.H. Moth. If Mr. Pratt wins the race he will forfeit this prize.

THE LAWS OF THE RUMBLE CLUB.

In view of the institution of a Rumblers' Club in several of the Flying Clubs both in Great Britain and the Dominions, the following extracts from the Rumblers' Act, as laid down in a famous Squadron in the R.A.F., together with the fines inflicted, are published for the information of all concerned:—

THE RUMBLE ACT.

PREAMBLE.

Whereas, a Club called the Rumblers' Club having been instituted, to the financial detriment of certain classes of its members, hereinafter referred to as Rumblers, and the financial benefit of the Plate Fund of the Officers' Mess, it is by these powers enacted as follows:—

Every member committing any acts which fall under the following sections shall be mulcted in the way specified, and shall have no redress, save by an appeal to a General Meeting of the Club, such appeal, if disallowed, rendering the appellant liable to an addition of 6d. to the fine imposed.

The Common Rumble (1s.).—Openly and with or without deliberation or forethought using one or both engines in landing, having *under*shot the aerodrome.

The Surreptitious Rumble (1s. 6d.).—Clandestinely and wilfully and with malice prepense using one or both engines in landing, in a cunning and underhand manner calculated to conceal their use from members on the ground.

The Super Rumble (2s.).—Openly and with or without deliberation aforethought using one or both engines for the purpose of going round again—having overshot the aerodrome.

The Surreptitious Super Rumble (2s. 6d.).—The same as a super-rumble, but done clandestinely and in an underhand manner with malice prepense, calculated to deceive members into believing that no landing was intended.

The Common Crash (3s.).—So disintegrating an aircraft (other than its wheels and tail skid) that it may not proceed to the hangar without assistance.

The Write Off (5s.).—So disintegrating an aircraft that it may not proceed to its hangar other than by instalments and is struck off the Unit strength.

Committing a Common Nuisance (1s.).—Did omit or commit any action when flying, about to fly, or having flown, which is an offence against flying regulations.

Committing a Bumble (6d.).—Having bounced, using an engine or engines to assist the second landing.

Failing to Bumble when Necessary (1s.).—Failing, when he should do so, to use the engine or engines necessary to assist the second landing after bouncing.

Common Crumble (2s.).—Being in control of an aircraft, shall lose control of the said aircraft, thereby causing damage to his own or other aircraft or to any buildings or any appurtenances or hereditaments pertaining thereto, or to any of the King's lieges or their livestock or to any fence, byre, hencoop or other obstruction.

Common Scramble (1s.).—To attempt, with or without success, to extend the glide of an aircraft with a view to avoiding a Rumbler's fine, either by diving and pulling up or by any other means.

Common Grumble (1s.).—Any person grumbling or grousing about anything whatever to do with his job, especially in the hearing of anybody not in the Unit.

Common Ramble (2s.).—Failing to steer a proper course, causing action to be taken in accordance with regulations concerning Aircraft Overdue. (If a qualified navigator, 100 per cent. surcharge.)

A Common Cobhamble (1s.).—The appearance in any newspaper, periodical, or magazine of a photograph or reference in print concerning the offender, if done without his knowledge and connivance, other than the *London Gazette* and the Posting List

A Super-Cobhamble (2s. 6d.).—Deliberately, and with intent to promote the self-advertisement of the offender, to cause to be inserted in any newspaper, periodical, or magazine, any photograph, article, or reference in print other than the *London Gazette* and the Posting List.

The Common Tumble (2s. 6d.).—Deliberately, and while temporarily of sound mind, or otherwise, leaving an aircraft in the air in order to make a parachute descent. Subsequent offences will be charged 6d. extra each time for each offence.

The Common Gamble (with death) (2s.).—Performing any action when about to fly, flying, or having flown, calculated to cause tarmac heart in an individual of H.M.R.A.F. by looking dangerous or by being dangerous.

The Common Booble (1s.).—Committing any action when about to fly, flying, or having flown, by which an aircraft having the right of way is baulked, beggared, or bewildered.

The Common Swivel (1s. 6d.).—When taxying an aircraft swinging round in a way calculated to damage the tail-skid or undercarriage.

The Super-Swivel (2s. 6d.).—After landing, swinging an aircraft round with its tail-skid off the ground.

The Super-Booble (£1).—Committing, in order to avoid a Rumbler's fine of any sort, any action in the air or on the ground likely to cause damage to the aircraft.

The Common Blamble (1s. 6d.).—Any person, having committed an offence under the Rumble Act, blaming any other pilot, aircraft, buildings, war material, aerodrome surface, or any cow, sheep, or other live-stock, or any of the King's lieges or their dogs, cats, or any hares, rabbits, partridges or other wild game, shall be fined the sum above in addition to the appropriate Rumble fine.

The Common Fumble (1s.).—By fumbling or otherwise, purposely or by accident, opening a parachute when not required to reduce the speed of the offender's descent.

The Common Mumble (5s.).—Landing an aircraft and mouthing a request to the local inhabitants as to its whereabouts.

The Humble (6d.).—Landing in so low and humble a manner on the aerodrome at such a distance from the tarmac that the character of the landing can only be inferred from the observed or heard results.

The Hamble (2s.).—When about to fly, flying, or having flown, committing any act of airmanship calculated to be of a grotesque or astounding nature—*e.g.*, flying with one wing down to counter the effect of drift on a course, or such as finding the wind-speed when above an unbroken layer of cloud and with the earth invisible by watching the direction of the movement of the clouds, or similar law.

The Dawdle (6d.).—Conduct when about to fly, or having flown, calculated to delay unnecessarily other aircraft requiring the flare path.

The Common Bubble (1s.).—Causing a radiator to boil by neglecting to open the radiator shutter efficiently.

The Common Dissemble (1s.).—After committing, or during the commission of, an offence against the Rumble Act, attempting to avoid the penalty by behaving in such a way as to lead members to believe that the aircraft concerned belonged to any other Unit.

The Lyndle (2s. 6d.).—Wantonly and with reckless abandon to allow oneself to deceive members on the ground by conversation, dress, or aviation into confusing one with any well-known aviator.

The Scrabble (1s.).—To deface the Rumble book by scrabbling, scribbling, or otherwise attempting to obliterate an entry either to contest it or to avoid a rumble fine.

The Common Bramble (6d.).—When committing, or having just failed to commit, an offence under Section 25 (The Humble), causing an aircraft to disintegrate and/or carry off portions of or complete gorse bushes.

The Amble (1s.).—Any member who commits the following offence, that is to say, does not entirely shut off both his engines upon commencing to glide in to land, shall be deemed to have committed an offence under the aforesaid Act, and shall be mulcted in the sum of 1s.

Hanworth Club
(The London Air Park)
Berks, Bucks & Oxon Light Aeroplane Club
Hull Aero Club
Yorkshire Aeroplane Club

N.F.S. Membership now embraces four Clubs.

THE conditions of membership of the N.F.S. provide that a member of any one Club automatically becomes an honorary member of all other N.F.S. clubs. Four of these clubs are now open to receive members, and, upon completion, the N.F.S. organisation will embody a chain of 71 clubs and landing grounds.

Members of N.F.S. are entitled to the use of each club-house, and free landing at all the N.F.S. stations, wherever such units may be established. At every provincial Air Park there will be a comfortable club-house, hangars and workshops, and lock-up garages for members who keep their own machines. A normal complement of four light aeroplanes will be kept constantly in commission for training members of the club, for hiring out to members, for joy-ride flying, and for taxi service and commercial flying generally, and this establishment will be increased when the demand justifies it.

A limited number of members are now being enrolled at the following favourable rates:—

HANWORTH CLUB: Flying Members, 5 gns. entrance fee, 5 gns. annual subscription; Non-flying Members, 3 gns. in each case.

OTHER CLUBS: Flying Members, 3 gns. entrance fee, 3 gns. annual subscription; Non-flying Members, 1 guinea in each case.

Reduced rates are available for "Life," "Family," and "Overseas" membership. No entrance fee is payable by Serving Officers of H.M. Regular Forces, nor by Members of the Corps Diplomatique.

COMMERCIAL AERONAUTICS.

IMPERIAL AIRWAYS.

The fifth Ordinary General Meeting of Imperial Airways as held on Sept. 26. The Rt. Hon. Sir Eric Geddes, G.C.B., .B.E., Chairman of the Company, presided.

The Chairman, in the course of his Report, said that ord Chetwynd had resigned his seat on the Board on the ounds of ill-health.

Referring to his own resignation from the Chairmanship the Board, which was announced at the last meeting, Sir ric Geddes said that he had found it difficult to sever his nnections with the Board owing to several pending nego-ations, and also to the pressure of his colleagues that he ould retain the Chairmanship.

The Balance-Sheet.

There was a further substantial improvement in the position of e company, both from the balance-sheet and the trading point of ew. On the asset side, Aircraft and Engines, less cost of units ritten-off or otherwise disposed of, stood at about £225,000. No new rcraft had been brought into service during the year under review, it an item of about £64,000 was shown for Progress Payments on rcraft under construction. One of these was a new flying-boat for e new Mediterranean section of the India service, and the remainder d been ordered under the normal construction programme for re-acement of obsolescent units. They were now in commission, and ere being worked on the European services.

Premises, Lease, and Plant had increased from about £43,000 to 47,000. During the year £11,000 was accounted for by the purchase a motor depôt and salvage ship and other equipment for the Medi-rranean Division. This ship was stationed at Crete. The slight icrease in Stores, Spare Parts, and Tools represented part of the st of the inauguration of the Mediterranean Division.

Cash and Investments

Cash and Investments amounted to over £270,000. Three items of reliminary expenses, underwriting commission, and inauguration and urvey commission, had disappeared. The last item of £25,000 was in espect of the 25,000 Deferred shares issued to the Air Ministry in onsideration of the Company's complete release from all obligations repay any subsidy and as a condition of the grant of the increased ubsidies now enjoyed. The Board proposed to provide for the amor-isation of this amount during the next ten years, the period of the ew main agreement with the Government.

The profit for the year amounted to nearly £79,000, almost a ten er cent. improvement over last year.

Profit and Loss Account.

The gross profit on the trading account was £140,000, as compared ith £132,000 for the previous year. As there was no extension in he magnitude of the Company's operations (the India service did ot come into being until the current year), this might be regarded s satisfactory.

The Directors' fees had increased from £5,000 to £7,000 per annum. This was due to special missions and duties undertaken by the Directors in connection with the extension of the services in India nd beyond.

The Aviation and General Insurance amounted to about £12,000. The proportion of this which belonged to the insurance of the leet amounted to a premium of slightly over three per cent. of the ost value. The Board believed that no other air transport com-pany in the World could obtain cover at this figure. The high tandard of safety was reflected in the low insurance rate.

Obsolescence of Aircraft and Engines.

The obsolescence allocation of £36,000 was some £4,000 lower than he previous year's figure. The decrease was due to certain aircraft aving been sold and others written off during the year, but repre-ented a normal rate.

The question of obsolescence and its companion item "New Con-truction" had received the very close attention of the Board. In ecognising the principle that larger aircraft were more economical o operate than smaller ones, the Company were moving towards arger and initially more costly units when traffic prospects justified t. The additional cost of operating these large craft showed itself n the expenditure side of the trading account immediately they ame into commission, while the additional revenue they were apable of earning would grow gradually. The Obsolescence Reserve hould, therefore, be increased to a larger figure than normal when he Company was able to do so. An additional sum of £20,000 had een placed this year towards the Obsolescence Reserve. The Com-pany were beginning to provide for obsolescence for aircraft not yet uilt.

Dividend and Profits.

The Board recommended the payment of 7½ per cent. dividend, which would absorb £35,558, leaving a sum of £6,688 to carry for-ward. This result had been attained upon less subsidy and after clearing the balance-sheet of all inauguration expenses and of all urvey and development expenses to date.

Traffic and Operations.

The traffic revenue for the year under review had increased by 29½ per cent. compared with the previous year. The turnover of he European services had more than doubled during the three years beginning on March 31, 1926.

The traffic revenue on the Cairo-Baghdad-Basrah service had in-creased by 48 per cent. compared with the previous year. The first turning-point in the economics of commercial aviation had been reached two years ago, when, for the first time, the company earned a gross profit on the prime costs of operation. In Europe, in order to earn the subsidy, the Company had to fly an annual minimum mileage. Actually they had flown in 1928-9 ninety-four per cent. more than the minimum required. Thus step by step the Company was getting nearer towards being independent of subsidies. The Near East service had supplemented its revenue by flying 12,500 of non-subsidised miles in Palestine and 'Iraq.

Statistics of Operations.

During the year the Company's aircraft had flown 1,032,842 miles, and had carried 34,757 paying passengers and 873 tons of mail, freight, and excess luggage. Of the capacity provided 74½ per cent. had been filled with paying traffic in Europe and 61 per cent. in the Near East. Of the services scheduled in Europe, 92.85 per cent. had been completed, although the weather conditions were probably less favourable for flying than anywhere else in the world. The regularity achieved on the services in the Near East had been 99.37 per cent. The goal of 100 per cent. had been lost because of severe dust-storms.

For the fourth year in succession the regular services had been free from accident involving injury of any kind, and it was with deepest regret and sympathy that he referred to the wonderful record being marred in the fifth year. No transportation company could expect to be entirely free from accidents, but anything that skill and forethought could do was devoted to upholding the wonderful record for safety.

The Fleet.

The Company had ordered eight of the largest aircraft ever built for regular commercial services. Some of these were for the European services and some for the India service. They would be fitted with four engines with a total of 2,000 h.p., and would be capable of carrying about 40 passengers in addition to the crew. These aircraft should show a remarkable advance in the development of aircraft design, efficiency, and comfort.

The England-India Service.

The England-India service had been inaugurated in March, 1929, and had been working with remarkable regularity ever since. It was the longest organised air route in operation in the world. Its length was almost 5,000 miles, of which 1,800 miles were operated by marine aircraft across the Mediterranean. The service operated over ten countries speaking seven or eight different languages and utilizing nine different currencies. He was sure his hearers would join him in congratulating the staff at home who had done the planning, training, and construction programmes, and the staff overseas who had operated the service. He would make a special mention of the pilots who had shown such skill and magnificent devotion to their duty throughout the whole line. He would also pay a very warm tribute to the Air Ministry for the support and assistance they had given in the arrangements which had been concluded with foreign Governments on the route and to the staff of the Air Ministry and to the Royal Air Force for their invaluable assistance, particularly in regard to the ground wireless chain and the meteorological organi-sation.

During the recent disturbances in Palestine the Royal Air Force in Egypt and Palestine had given invaluable help, which had enabled the Company to continue the service with little deviation from schedule.

Need for Public Support.

The most profitable and constant source of revenue on the India and other routes was mails. The growth of mail traffic on the India route was steady, but it was not increasing as rapidly as they had hoped. He would urge every shareholder to use his or her personal endeavours to preach as well as practise tthe "Air Mail" habit.

The passenger traffic was in its infancy on the route from England to India. The provision of good ground accommodation for passen-gers was a problem which could only be solved progressively. At present it was frankly not luxurious, but until the night halting-places were permanently fixed and the route finally selected, with security of tenure, it would be folly to sink capital in buildings in the desert or down the Persian Gulf or through the African Equato-rial forests. Night flying or a change of schedule, or route might make such accommodation useless.

At present the schedule for the service from London to Karachi was 7½ days. By gradual improvements in the ground organisation this was going to be systematically diminished until, by perhaps another year or so, a five-days schedule to Karachi with satisfactory air connections across India would mean a little over six days for Calcutta.

Extension of the India Service.

The Board aimed to extend the India line all the way to Aus-tralia, and were in negotiation with the Government of India for the operation of a service between Karachi, Delhi, and Calcutta. Imperial Airways had offered to charter to the Government of India aircraft for a service between Karachi and Delhi, and possibly on to Calcutta, on a temporary basis, for a period of two years, to connect with the England-India line.

Egypt to South Africa.

The concluding stages of an agreement between Imperial Airways and the British Government at home, acting with the Governments of South Africa, Kenya, Uganda, Tanganyika, Sudan, and Rhodesia for the operation of a service between Egypt and South Africa, had been reached, and now awaited ratification. The Cobham-Blackburn Air Lines, Ltd., were associated with Imperial Airways in this ven-ture, and Sir Alan Cobham and his colleagues would join the Board of the subsidiary company which was to be formed to operate this section of the route. The northern half of the line, from Egypt to Lake Victoria Nyanza, should begin operations this time next year, and the southern half to Cape Town about six months later.

Air Mails.

With regard to the air mails, the postal authorities retained a proportion of the air mail fees paid by the public. On the India

Digitized by Google

air mail the Post Office charge to the public was 21s. 3d. per pound, and the Post Office paid for Air Mail service from Croydon to Karachi 14s. 1d. per pound. The interesting result of this was that the Post Office would deliver a letter by ordinary mail in India for 1½d., but to hand it to Imperial Airways at Croydon they charged 2½d. a letter.

A Review of Five Years' Operations.

In the first year, traffic amounted to a total of 391,000 ton-miles, and in the fifth year 803,000 ton-miles, an increase of over 100 per cent. In the first year the Company completed 75 per cent. of the flights scheduled; this figure improved year by year until in the fifth year it was almost 93½ per cent.

The Board had examined many propositions for internal flying in the British Isles, and in none so far had they found conditions to show, in the present stage of the development of aircraft design, a service that could be profitably operated. The efficient railway services, together with the poor average flying weather and the high percentage of terminal delays owing to the shortness of the routes, were some of the chief factors which went to lessen the likelihood of success.

The Company's relations with all Government Departments were cordial. The relations of the Company with its staff and employees was also of the happiest, and the executive of the Company was a team full of enthusiasm and determination. To them throughout, and to Mr. Woods Humphery in particular, the Company owed thanks and appreciation.

LIKE A ROCKET IN THE SKY.

On Sept. 30 Herr Fritz von Opel succeeded, after two abortive attempts, in rising from the ground and flying a short distance in a rocket-launched and rocket-driven aeroplane.

The dissimilarity between the Press accounts may be accounted for by the thick clouds of smoke and flame which surrounded the aircraft and its inventor, thereby obfuscating the issue and making the reporters draw upon their imagination.

The glider which had been converted for these experiments carries a tail unit on outriggers which ensure that the control surfaces are not harmed by the exhaust gases which pass beneath. Experiments had already been made by towing the glider behind a car and firing the rockets in the air.

On the occasion of the public demonstration, the glider was mounted on a trolley running upon thirty feet of rail with a buffer at one end. This trolley was propelled by rockets. When the trolley hit the buffer and catapulted Herr von Opel and his glider into space, rockets carried in the rear of the glider's nacelle continued the propulsion.

Unfortunately two attempts met with failure as the rockets in the glider failed to ignite. The third attempt was successful and a short flight was made. This appears to have resembled the trajectory of a projectile. Apparently his "fiery chariot" described several curves and finally landed abruptly. A startled onlooker who was the first to reach Herr von Opel found him "feeling the effects of his experience" securely strapped in his asbestos-covered cockpit and surrounded by a mass of red-hot and smoking tubes. One feels that Herr von Opel should be congratulated for his courage.

EUROPE TO CALIFORNIA IN SEVEN DAYS.

Western Air Express and the United States Lines have completed arrangements whereby passengers from Europe by any of the ships of the United States Lines may avail themselves of what is virtually a seven-day boat, train and aeroplane service from Europe to California.

Passengers from Europe on arriving at New York take a train to Kansas City where they arrive 34 hours later. Here they transfer to an aeroplane belonging to Western Air Express and fly to Los Angeles in 12 hours.

The total time from New York to Los Angeles is 46 hours and the fare $245 (£49), which includes transportation to and from airports and the midday meal in the aeroplane.

The time across the States with only one change is claimed to be faster by two hours than any other existing air and rail combination.

UNSUBSIDISED AIR TAXIES.

Northern Air Lines have decided to reduce their passenger rates for "Air Taxies" by 33⅓ per cent. per mile.

The fare for one passenger will now be tenpence instead of one shilling and threepence, and for two or more ninepence per mile each person.

This reduction has been made possible by an interesting circumstance. When Northern Air Lines started, an estimate was made of the probable time that would be flown each year. Owing to the unexpected popularity of the "Air Taxies" this number of hours has been exceeded by more than one hundred per cent. although the Company has only been working six months.

The public have patronised the service so well that the estimated allowance for "overheads" has been drastically reduced and this advantage is to be shared with the public.

It is felt that the reduced prices will lead to still more business and that further reductions may be possible next year.

It is believed that the new rates are the lowest charged by any firm for the hire of private passenger "Air Taxies."

A NEW AUSTRALIAN CIVIL AVIATION COMPANY.

A company known as the Eyre Peninsula Airways, Ltd., has been formed in Adelaide with a capital of £10,000. The object of the company is to operate a passenger and freight service between Adelaide and Streaky Bay, by way of Wallaroo, Cowell, Tumby Bay, Port Lincoln, and Elliston, with an alternative service between Adelaide and Yorketown by way of Ardrossan, Maitland, and Minlaton.

The company has acquired a Junkers F-13 four-seat monoplane.

CROYDON NOTES.

Our energetic Under-Secretary of State for Air, Mr. Montague, accompanied by Mr. Bertram, Deputy Director of Civil Aviation, has just completed a five day tour of the Foreign Air Lines of Europe.

Starting on Sept. 24 by Dutch K.L.M. from Croydon to Amsterdam, he connected with the A.B.A. Swedish line from there to Malmo. By French Farman and German Luft Hansa, he made his way from Malmo to Berlin and Dresden the following day, and from Dresden to Vienna via Prague he made use of the Czechoslovakian Air Transport Company. From Vienna to Cologne, Mr. Montague flew by Luft Hansa on the fourth day of his tour, and the Belgian Sabena brought him home to Croydon from Cologne on the fifth day according to schedule.

Mr. Montague as a business member of a business Government has thus done exactly what an enlightened business man would do. Instead of sitting in his own factory with cotton wool in his ears, praising his gods that he was an Englishman, he has sallied forth and visited the factories of all the most important foreign houses in the same line of business as himself and has doubtless come home brimful of good ideas which will eventually be to the improvement of British Commercial Aviation.

An uninterrupted decade of Air Line operation under one management is at present something of a rarity. This does not, of course, mean the somewhat furtive celebration of ten years' work which is made up of the scant years of the actual celebrant firm added to those of predecessors who either vanished naturally or became amalgamated in the manner of a rabbit effecting a reluctant merger with a python.

A genuine tenth anniversary will be quietly celebrated at the Hague on Oct. 7, when it is not only the tenth birthday of K.L.M., but also the tenth anniversary of Mr. Albert Plesman's connection with the firm as Director. Mr. Plesman founded the K.L.M. and has identified himself so closely and untiringly with it ever since, that the world-wide reputation of the K.L.M. all over the World for efficiency and good organisation is Mr. Plesman's personal reputation also. Mr.

Digitized by Google

Plesman is more to his Firm than a mere director whose chief function appears in some cases to be that of looking important in a limousine behind a large cigar and observing with satisfaction the terror of his office boys. Mr. Plesman is a personal friend to his employees and that is why many of them have been with him close on ten years.

K.L.M. is essentially an international organisation in spite of being a Dutch National Company, and in it are to be found English, Russian, German, French and Scandinavian employees, all working happily together. English is the official language of the Firm, but conferences are held and letters written in four or five different languages at the Head Office, The Hague. In this way, a broad outlook upon what should essentially be an international business has always been maintained by the Directors of K.L.M. towards commercial Aviation.

Belated efforts are being made to get up some sort of athletic association at Croydon Aerodrome, but facilities for anything but team work are lacking. Employees of the various firms find it extremely difficult to band themselves together at a given time into elevens or fifteens and sports of this sort are not altogether what are wanted. Many of us are getting too old for rugger, although we still feel capable of making the younger generation see stars on a football field.

Actually, however, we should probably crack up if we took to the more strenuous games again, and, anyway, we have not time for this class of thing.

Many people here work from 7 or 8 a.m. on Monday morning until 7 or 8 p.m. on Saturday evening and on Sundays as well.

Part of these hours may be spent in standing by for late machines or in the case of pilots, as stand by or reserve pilots, with nothing especial to do except stay on the Aerodrome in case of need. What these people with the odd hour or half hour to spare obviously need is a gymnasium, fives court, or facilities for squash racquets or hard-court tennis. When the new Aerodrome only existed as a blue print we made urgent representation to the Air Ministry for a Squash Court, pointing out that it was at least as important for Commercial Aviation folk to keep fit as it is for the R.A.F. if not more so.

The Air Ministry, notorious for the economical way they do things, could not at that time see their way to "wasting money" on so frivolous a thing as a Squash Court. Now there are certain financiers at Gwydyr House or elsewhere who never cease counting the piles of sixpences and twopences which pour in from visitors to the Aerodrome or to the public enclosure. These visitors pay their money to see the aircraft of various Firms and the organisation of those Firms. They are thrilled by arriving and departing Argosies, Fokkers, Golden Rays and the like, and by the sight of pilots and others in magnificent uniforms, and they are not even shown the mummy of a Government official in a glass case. Thus, the majority of the profit made by the Air Ministry on visitors, which is quite a fat profit now, and will increase year by year, morally belongs to the Firms who provide most of the fun. Either it should be taken off the rentals which are the highest in Europe, or, better still, saved up until there is enough to build a Squash Court. What about it Whitehall?—No reply.—SPRY.

PARCELS TO PARIS.

The Postmaster-General announces that the senders of air parcels for Paris may now undertake payment of the Customs and other charges that would normally be collected from the addressees. The parcels will be subject, as regards acceptance, to the general conditions applicable to parcels sent to France by the ordinary service for delivery free of charge.

THE COMPASS SWINGING BASE AT CROYDON.

Air Ministry Notice No. 49 of the year 1929 announces that a new and improved form of Compass-swinging Base is available at Croydon aerodrome.

The charges for use range from 5s. for a machine with an empty weight of less than 3,000 lbs. to £1 for machines weighing over 10,000 lbs.

Applications for use should be addressed to the Chief Aerodrome officer, who will detail a traffic hand to superintend the use of the base.

The notice includes instructions for the correct use of the base.

THE REWARD OF VIRTUE.

Mr. A. V. Heaton and his mechanic, Mr. J. Exley, both of Berkshire Aviation Tours, Ltd., had a forced landing at Scarborough on Sept. 12. The machine was alleged to be an *Avro Bristol Fighter*!

The point of the story is, however, that to avoid killing anybody on the crowded beach, Mr. A. V. Heaton alighted on the water. Fortunately, neither he nor his mechanic were hurt. They were brought ashore and the machine was salved later.

CUTTY SARK

CABIN FLYING BOAT.

LONG years have passed since the *Cutty Sark*, famous old-time clipper, battled for supremacy over the world's trade routes. To-day, inheriting that famous name, comes a new *Cutty Sark*, carrying the speed, grace of line and seaworthiness of its predecessor to a higher pitch, and adding to them the final virtue of flight.

Cutty Sark flying boats are equipped with either one, two or three engines. The smaller model seats four in an enclosed cabin. The larger seats eight and has a top speed of 135 m.p.h. All have Saunders-Roe easy-repair all-metal hulls and Saunders-Roe plywood cantilever wings. Twin engined models can fly level with one engine out of action.

Saunders-Roe also produce refuelling tenders, petrol and oil scows, floating docks for marine aircraft, high-speed tenders, bomb loading barges, and other seaplane servicing units.

THE ROTATING RADIO BEACON AT ORFORDNESS.

Air Ministry notice to Airmen No. 56 of the year 1929 announces that an experimental rotating radio beacon has been installed at Orfordness, Suffolk, and is being operated.

The Air Ministry are particularly anxious for all pilots and radio operators to co-operate in testing this beacon, and they ask that all results should be recorded and sent to the Secretary of the Air Ministry (Signals).

Air Ministry Pamphlet No. 38, entitled *Orfordness Rotating Wireless Beacon. Instructions for taking Bearings.* Price 3d. net, and obtainable from H.M. Stationery Office, gives a brief description of the beacon, the method of working, details of signals emitted and the manner in which the beacon may be utilised as an aid to navigation.

THE U.S. AIR MAIL.

In the first six months of this year Air Mail contractors in the United States carried 1,548.9 tons of mail over a distance of 6,379,776 miles, for which they received a sum of $7,280,441.

GERMAN CIVIL AVIATION.

The Berlin correspondent of *The Times* states that the belated report for 1928 of the Deutsche Lufthansa shows receipts amounting to 31,754,883 marks (£1,587,744), and expenditure to 31,745,387 marks, leaving a bare surplus of 9,496 marks (1927, receipts 30,615,321 marks, expenditure 30,596,267 marks, surplus 19,054 marks). The income consisted as to two-thirds of public subsidies and as to the remainder of working receipts. A total distance of 10,217,529 kilometres (about 6,250,000 miles) was flown in passenger flights and mail services (1927, 9,208,029 kilometres).

The Lufthansa regards the coming years as decisive for Germany's place in international air communications, and considers the most important of its immediate tasks to be the organisation of the Far Eastern and South American services. The first of these is temporarily delayed by unsettled political conditions and the second by the stage of technical progress. The second task is the development of communications with the industrial centres of Europe, particularly for freight and mail traffic. Next to these in importance come the longer internal stretches, for which the development of night flying and blind-flying methods is considered essential.

INCREASED SWEDISH AIR TRAFFIC.

The passenger, goods and mail traffic on the Swedish air lines this year has shown a great increase, according to the latest reports published in Stockholm. The number of passengers using the Stockholm—Berlin and Malmo—Amsterdam lines has risen considerably since the preceding year, and the Stockholm—Helsingfors passenger traffic this season shows an increase of 67% over 1928.

At the Bulltofta airport near Malmo, which is the most important aerial centre for Continental traffic, the number of in- and out-going passengers during the first eight months of this year was 3,869. The number of arrivals and departures of machines during the same period was 1,693, and the total quantity of in- and out-going goods and mail about 160,000 kilograms.

The increasing public interest in aviation is further evidenced by the number of short flying trips at the Stockholm and Malmo stations, which this year covered a total stretch of 17,000 kilometres. The sight-seeing flights above Stockholm this year attracted 1,177 passengers against only 690 in 1928.

Several ambulance flights to out-of-the-way places in the Stockholm archipelago have been successfully performed, bringing patients in a critical condition into the Stockholm hospital.

AERONAUTICAL EXPANSION IN POLAND.

The Aeroplane of Sept. 4 announced the signing of an Air Traffic agreement between Germany and Poland. The opinion was then expressed that this agreement would probably result in a service between Berlin and Warsaw.

A correspondent writing from Warsaw on Sept. 13 to *The Manchester Guardian* is able to confirm this opinion with definite information.

In 1930 a direct air line between Warsaw and Berlin will be opened, and as the Poles very shortly expect to negotiate an Air Traffic agreement with the Soviet, this Berlin—Warsaw line should be extended to Moscow.

A new air line is proposed which will join Berlin, Breslau, Kattowitz and Lodz. Reports state that the Poles and Rumanians are negotiating with the idea of opening a direct service between Warsaw and Bucharest.

Marconi Short-Wave Transmitter Type A.D.19.

SHORT WAVE WIRELESS FOR AIRCRAFT

Short wave wireless equipment is particularly suitable for military and naval aircraft. Fixed aerials, giving complete freedom for manœuvring, may be used, and a number of important services may be conducted within a narrow waveband without interference. New short wave aircraft transmitters and receivers, Types A.D.19, A.D.20 and A.D.21, designed by the Marconi Company, combine these advantages with high efficiency, light weight and extreme compactness.

WHAT OTHER NATIONS DO AND THINK.

The following letter from a Greek reader of The Aeroplane in Greece will be of interest to those readers in the British Aircraft Trade who have the intelligence to appreciate all that it implies:—

I was very much surprised to read in your article on the "*Challenge International de Tourisme*" that the only two British entrants out of 50 odd were flying under the French flag.

Of course if either one or both of the entrants come first, it will be a great honour for England but how much better if they were entered under their own flag.

If the Aero Club, working on the prevailing economy campaign, could not see its way to pay the paltry sum of £200—paltry in view of the great advertisement, could not its members or even the public have been asked to contribute? I for one would gladly have given my contribution, and am certain that a far larger amount than that needed would have been collected.

But unluckily advertisement seems a thing hated by Britishers, and this is the chief reason why, anyhow in this part of the world, everyone talks mostly of French, Italian and German achievements. As an example, may I quote the following:—

The Greek Government, deciding to change the type of aeroplanes used by the Army Air Services, applied for tenders. From the 10th to the 20th Aug. any firm wishing to compete would have to send over a machine to be flown and shown off in Athens. English, French, Italian, German, Czechoslovakian firms are competing and every day flying is taking place at the Tatoï aerodrome.

British machines were very much admired, but the French in order to attract the public's attention arranged for a visit of the "*l'Oiseau Canari*" piloted by Assolant, Lefevre and Lotti, and have also sent over their best aerobatic pilot, Doré.

A great campaign was started in the papers and numerous French achievements were mentioned.

The French Legation organised for Sunday a flying exhibition under the auspices of the French Minister for which numerous invitations were sent. Special trains and 'bus services were arranged. The other day Doret flew over Athens and gave an exhibition of aerobatics, and all Athenians are now under the impression that France leads in the air.

Nothing in the papers regarding British machines and achievements.

Cobham arrived here on his return from Australian and African tour and only drew a couple of lines in the daily press. Scarcely anything was mentioned of Capt. Broad's demonstration, a few weeks ago, on a Moth, which was promptly bought by the Naval Air Service. Was it not then the ripe moment for the British Legation to organise as well a demonstration?

When I mentioned this demonstration to a number of friends no one seemed to have heard anything about it, and personally I, who am still interested in an amateur way with flying, only heard of it two days before Capt. Broad's return to England.

Greece owing to its situation and bad communications is in great need of an air service and now, when the formation of civil air-lines and of an Aero Club is under discussion, is the time to strike out an advertisement campaign.

As regards communication may I just mention an example that in order to go from Athens to Sofia one must either go via Nich (Yugoslavia) 48 hours, or by boat via Dedeagatch, and from thence via Adrianople (Turkey), whilst by air it is a question of a few hours. Mails from and to Sofia take 3 to 4 days, i.e., as long as a letter takes from London.—"Dick."

WHAT ENTHUSIASM CAN DO.

The cost of an aeroplane is often quoted as the reason which prevents everyone from flying. Everybody would fly if they could afford the pastime. Mr. S. Buckle, of Dratton, near Abingdon, has shown everyone how one may fly for less than £20 in their own aeroplane.

Mr. Buckle has bought a number of scrap aircraft parts originally belonging to a variety of types. These parts he has tied together to make a high-wing monoplane, which was flown by Mr. J. S. Tanner for the first time on Sept. 19. The engine appears to be a 60 h.p. Anzani.

AN IMPERIAL (?) AIR DERBY.

To call an international air race starting in the United States and finishing in Canada an "Imperial Air Derby" seems a little inaccurate. On consideration the name becomes obviously more inappropriate as the effect will be to demonstrate American-built aircraft in Canada.

Mr. Charles O. Stillman, President of the Imperial Oil Company, has announced that this company proposes to offer £10,000 towards promoting a race of this kind next year.

THE EXPANSION OF TRADE.

T. B. Browne Ltd., who describe themselves neatly as "Incorporated Practitioners in Advertising," have just issued the 1929 edition of *The Advertiser's A.B.C.* This issue thoroughly upholds the reputation which the book has had for the last forty years as the most valuable work of reference for advertisers.

As yet the Aircraft Trade does not, or cannot, afford to indulge in general advertising. But we are rapidly arriving at the time when on certain occasions firms will find local advertising of considerable value. And in *The Advertiser's A.B.C.* they will find the names of all the publications of any real importance in every town or every district in the United Kingdom and in the British Empire as well as the names of the leading papers in all countries all over the World.

When flying meetings are being held in certain places people who want to sell aircraft to private owners may very well advertise in the local papers. And when a firm is making a deliberate attack on the business of one particular nation it may very well advertise in the leading papers in that country, if only for the sake of getting good editorial attention. And the 21s. which *The Advertiser's A.B.C.* costs is little enough to spend on getting that information.

CAPTAIN P. D. ACLAND.

Captain P. D. Acland, of Vickers (Aviation), Ltd., has now sufficiently recovered from his recent illness to be able to leave the Empire Nursing Home. It is not expected, however, that he will be able to resume his duties for several weeks. In the meantime, any letters addressed to him at Vickers House will be forwarded.

AVIATION INSURANCE.

Aircraft Comprehensive Insurance.—Aeroplane owners requiring Insurance covering damage, 3rd party, accident and life *should first consult* Services and General Insurance Agency, 108, Victoria Street, Victoria, S.W.1. *Special terms according to experience.*

Advice given and rates quoted.—Apply to Bray, Gibb and Co., Ltd., Aviation Dept., 166, Piccadilly, London, W.1, and 14, Sherborne Lane, E.C.4. All classes of Insurance effected.

PRACTICAL FLYING.

HENDERSON FLYING SCHOOL.—Lt.-Col. Henderson offers unique terms both for "A" and "B" licences. All technical coaching arranged for. Personal attention. Minimum rates. Write to Croydon Aerodrome.

CINQUE PORTS flying club (Subsidised). **WINTER RATES** commence Oct. 1. 6 months' sub. 31s. 6d. Entrance fee 21s. Monthly sub. 21s. No entrance fee. Seven of our members took "A" licences in 4 weeks ending Sept. 26. Under 2 hours by car from London. Enlarged Club Room and Bar. Send 6d. to Hon. Sec., Hythe, Kent, for illustrated brochure. **"LEARN AT LYMPNE."**

CHEAPEST FLYING IN THE WORLD! at the Norfolk and Norwich Aero Club. Subscription £3 3s. Instruction rates 25s. per hour. Accommodation can be arranged on Aerodrome. Applications to Secretary, Mousehold Aerodrome, Norwich.

Learn to Fly at the Midland Aero Club. Four tuition machines, two fully qualified expert instructors. No waiting. Particulars Hon. Secretary, 22, Villa Road, Handsworth, Birmingham.

Southern Aero Club.—Thorough Avro Tuition, no waiting list. "B" licences instruction arranged. Apply Secretary, Shoreham Aerodrome, Sussex.

The De Havilland School of Flying, Stag Lane Aerodrome, Edgware, Middlesex. Fourteen machines: Nine Moths, five advanced training machines. Seven Pilot Instructors, Lecture Classes, Restaurant and Recreation Pavilion. The largest and most up-to-date civilian organisation for flying tuition in the British Empire.

SITUATIONS VACANT.

Fitters required for Bench and Assembly, preferably used to Aircraft construction. District rate plus production bonus. Long job for capable men. Apply Westland Aircraft Works, Yeovil, Somerset.

Required immediately, Assistant for Stressing Department. Write stating experience, age and salary required to Handley Page Ltd., Cricklewood, N.W.2.

Wanted, Fitters with up-to-date experience of Air-cooled engines.—Pay £6 10s. and £7 10s. a week Service in Middle East.—Apply Box No. 5715, The Aeroplane, 27, Pilgrim Street, Ludgate Circus, E.C.4, giving full particulars of service and experience. Single men only.

Wanted for service abroad immediately.—Highly qualified engineer with thorough knowledge of design and construction of steel aeroplane. Applicant should have had sufficient experience on design and production. Good salary offered to competent man. Apply stating full particulars, experience, present position, salary and age to Box No. 5718, The Aeroplane, Cannon House, Pilgrim Street, E.C.4.

Wanted immediately in London, Senior Draughtsman for Aero-Engine D.O. Expectional prospects. Please apply stating all material particulars to Box No. 5720, The Aeroplane, Cannon House, Pilgrim Street, E.C.4.

Fully experienced woodworkers required. Apply Desoutter Aircraft, Croydon Aerodrome.

Two Checkers required for Metal Aircraft Design. State age, experience and salary required to Short Bros., Rochester.

Several Junior Draughtsmen required with aircraft experience. State age, experience and salary required to Short Bros., Rochester.

Wanted First-class Fitter-Erector with A and C Licence. Send full particulars, experience and rate required. London district. Box No. 5721, The Aeroplane, Cannon House, Pilgrim Street, E.C.4.

Senior Aircraft Draughtsmen. Four wanted immediately for London District. Applicants must state all details of experience and salary required. Write Box No. 1318, Shaw and Blake Ltd., 8, Bell Yard, Temple Bar, London, W.C.2. Advertising Agents.

Foreman required to take charge of fabric department of large Aircraft Works, including all covering and doping. Must be a keen disciplinarian, used to controlling male and female labour and with an up-to-date knowledge of spraying processes. Box No. 5717, The Aeroplane, Cannon House, Pilgrim Street, E.C.4.

AIRCRAFT WANTED.

Urgently wanted, a number of modern light aircraft for cash or exchange. Very best prices offered in part exchange for new machines. Before deciding obtain a quotation from Phillips and Powis Aircraft (Reading) Ltd., Reading Aerodrome. 'Phone Sonning 114.

SITUATIONS WANTED.

Youth age 17½ public school till December last, with slight all round knowledge of aircraft and highly interested in same, seeks opening with good prospects in aviation. Box No. 5719, The Aeroplane, Cannon House, Pilgrim Street, E.C.4.

Youth, aged 17, seeks opening with good prospects in Aviation. Strong, willing, good references. Apply Box No. 5722, The Aeroplane, Cannon House, Pilgrim Street, E.C.4.

Constructor of All-Metal Hulls and Fuselages requires post, as Instructor or Foreman, used to high-class work. Apply Box No. 5712, The Aeroplane, Cannon House, Pilgrim Street, E.C.4.

PRACTICAL TUITION.

Phillips and Powis School of Flying.—An "A" licence in the shortest time and the lowest cost at Reading. Personal attention, no waiting, concentrated instruction. Gipsy Moths. The School is very successful in turning out good pilots in a minimum time. Write for particulars of recent successes. Make it a flying holiday. Special offer, trial lesson 12s. 6d. 45 minutes Paddington—Reading Aerodrome. 'Phone Sonning 114.

TUITION.

We offer sound instruction in Aeroplane Design, Fitting and Rigging, and Aero-Engine Fitting and Rigging; also expert training for Ground Engineers (Categories A, B, C and D). All tuition is by correspondence. Write to-day for our "Aeronautical Engineering" Booklet. International Correspondence Schools Ltd., 179, International Buildings, Kingsway, W.C.2.

YOU'LL GET A BETTER BID FOR YOUR MACHINE AT BROOOKLANDS.

Send full particulars of your second-hand aircraft to the Brooklands School of Flying. You'll get a better bid for it there. And a better deal when you buy a new machine in part exchange for your own. The School's Sales Manager knows the second-hand market intimately and pays the full market price

BECOME OWNER PILOTS AT THE LOWEST POSSIBLE COST.—Buy your new Moth at Brooklands—Official D.H. Agents. Through its important financial connections the School can sell on specially attractive hire purchase terms.

SERVICE AFTER SALES.—To those who buy their new Moths from us we offer FREE SERVICE for the first month. The life of an engine depends on its treatment during this period.

REPAIRS AND OVERHAULS.—The School has extensive workshops and undertakes all repairs and overhauls for C. of A.

SPECIAL CHARTER.—Four-Seater Saloon machine available at shortest notice. Any distance.

FIRST-CLASS TUITION—NO SUBSCRIPTION.—Flying tuition at Brooklands is unequalled. Since June, 30 pupils have found that to be well taught *pays* in the end. Sound instruction depends on the *experience* of the Instructor. The following are responsible for the high standard of flying at the School:—H. D. Davis, A.F.C., Managing Director and Chief Instructor, E. A. Jones, C. M. Pickthorn, M.C., J. R. King, R. Y. Bush, who between them have done 14,250 hours' flying.

Ring up Byfleet 437 to fix a trial lesson—or write to

BROOKLANDS SCHOOL OF FLYING, BYFLEET • SURREY.

The Aerodrome is forty minutes from Waterloo. Five minutes' walk from West Weybridge Station. Trains every hour.

ON THE LAST COMPETITIONS OF THE YEAR.

When the composite and comprehensive report of the Schneider Trophy Contest appeared in THE AEROPLANE of Sept. 11, certain readers complained that after they had read it, although they had a very graphic mental picture of everything that happened during and was concerned with the Contest, they did not know who had won or what the times were. People have become accustomed to seeing results so displayed that even the half-witted can understand them. Apparently these particular readers did not grasp the idea that all the results were displayed in the best possible manner in a photograph of the official score-board. The notion of showing results in a photograph instead of in a long, strung-out table was too new for them.

This time there shall be no mistake. So, to avoid straining the intellects of a minority of THE AEROPLANE's readers, here are the results of the races at the Meeting of the Newcastle Aero Club on Oct. 5—which, thank Heaven, is the last full-dress flying meeting of an exhausting year.

THE RESULTS.

The Air League Challenge Cup.

HEAT 1.—1, J. D. Irving (Gipsy Moth); 2, Miss Leathart (Spartan).

HEAT 2.—1, Norman S. Todd (Moth); 2, S. A. Thorn (Avian).

HEAT 3.—1, P. Michelson (Avian); 2, R. N. Murray-Phillipson (Moth).

FINAL.—1, N. S. Todd (Newcastle Aero Club), handicap 1min. 55sec., speed 94 m.p.h.; 2, J. D. Irving (Newcastle Aero Club), handicap 43sec., speed 104¾ m.p.h.; 3, S. A. Thorn (R.A.E. Aero Club), handicap 1min. 11sec., speed 98½ m.p.h.

The Grosvenor Challenge Cup.

HEAT 1.—1, G. S. Kemp (Moth), Newcastle Aero Club; 2, W. L. Runciman (Spartan), Newcastle Aero Club.

HEAT 2.—1, J. D. Irving (Moth), Newcastle Aero Club; 2, R. G. Cazalet (Widgeon).

HEAT 3.—1, H. L. B. Dixon (Moth), Newcastle Aero Club; 2, A. Goodfellow (Avian), Lancs. Aero Club.

FINAL.—1, G. S. Kemp, time 20min. 16sec., speed 98 m.p.h.; 2, Dr. Dixon, time 20min. 50sec., speed 93½ m.p.h.; 3, A. Goodfellow, time 20min. 51sec., speed 93½ m.p.h.

The S.B.A.C. Challenge Cup.

1, Dr. H. B. L. Dixon (Newcastle Aero Club); 2, J. J. Hofer (London Aeroplane Club); 3, D. Wilson (Newcastle Aero Club).

A NORTHUMBRIAN TRIUMPH.

There is quite a good joke about these results, apart from their being a Northumbrian triumph. The Air League Challenge Cup, the Grosvenor Challenge Cup, and the S.B.A.C. Challenge Cup were all won on the Newcastle Club's old Moth G-EBPT, with a Cirrus II. engine.

As the results show, Mr. Todd, an *ab initio* member of

"LAST, THE TRAINED SQUADRON, FULL CHARGE—— THE SOUND OF A GOING."—(KIPLING—"*The Centaurs.*")

AT CRAMLINGTON.—XXIX Squadron, R.A.F., in formation.—("*Aeroplane*" *photograph.*)

Digitized by Google

the Club, trained by Mr. Parkinson, flew the machine in the Air League Race, Mr. G. S. Kemp, the Club's instructor, who succeeded Mr. Parkinson, flew it in the Grosvenor Race, and Dr. Dixon, also an *ab initio* member of the Club, trained by Mr. Parkinson, flew it in the S.B.A.C. Race.

PT is a genuine antique. Originally it belonged to Lord Ossulston, who sold it to the Club when he bought a Gipsy-Moth. It was badly crashed and was rebuilt by the De Havilland firm. For the racing on Saturday it was rigged by Mr. Alex Bell, who was the first Secretary of the Newcastle Club, and is now a fully fledged Ground Engineer with Cramlington Aircraft, Ltd., the enterprising venture recently formed by Miss Constance Leathart and Mr. W. L. Runciman, who are both members of the Newcastle Club, also trained *ab initio* by Mr. Parkinson.

The engine, a genuine Mark II. Cirrus, was carefully tuned by the Club's Ground Engineer, Mr. W. Dunning. Everybody concerned—the Club, and Cramlington Aircraft, Ltd., and Mr. Bell and Mr. Dunning—are all prepared to swear that there was no faking about the engine. The only departure from standard was that it had stub exhausts instead of the usual long exhaust pipe.

Furthermore, members of the Newcastle Club won two second prizes and a third. Which means that they collared six out of the nine prizes which were to be won.

Whichever way you look at it, the result was an all-round day out for the Newcastle Club. The handicappers, Messrs. Davey and Rowarth, did their best, and they provided time after time those excitingly close finishes to which Mr. Goodman Crouch and Mr. Dancy have accustomed us in the past. They were simply defeated by extraordinarily efficent tuning of the engine and rigging of the aeroplane, and by really clever flying by pilots who knew the course backwards as well as forwards. After winning the Air League Cup, PT was pulled back in the handicap for the Grosvenor Cup, and proceeded to win that. She was pulled back again for the S.B.A.C. Race, and still won.

The pilots said that she was only flown at full throttle for the one lap of the S.B.A.C. Race. But in all the races she showed herself to be just about as fast as the Gipsy-Moths flown by other people. Which only shows what can be done by skilful tuning and piloting

The Luck of the Weather.

Saturday, Oct. 5, was evidently the Newcastle Club's lucky day. Apart from winning two-thirds of the prizes, the Club had quite a good day financially, and the most wonderful luck with the weather.

On Thursday and Friday the weather was perfectly beastly. The pilots who journeyed to Newcastle on Thursday had about as bad a time as anybody could have. Miss Slade, of Heston, who flew to Newcastle all alone in her Mk. I. Moth, was at one point near Durham thrown clean out of her seat, away from her rudder-bar and control-stick, and had to hold onto the edge of the cockpit with both hands. And even the more bulky pilots who completely filled their safety belts said that they had hard work to stay put.

On Friday, when most of the pilots arrived, there was so much mist over Newcastle that those experienced aviators Mr. Alan Goodfellow and Mr. Michelson, of the Lancashire Club, missed Cramlington altogether, and sailed gaily on till they were compelled by shortage of petrol to land, when they found themselves in a field near Haddington, about ten miles from Edinburgh.

Even the ten Siskins of 29 Squadron had quite an uncomfortable journey, and a Moth conveying Wing-Commander K. R. Park suffered along with the other light machines.

Saturday itself, though it looked very threatening in the morning, and still more threatening at times during the afternoon, remained dry and not too windy, until an hour after the show was over, and then the rain came down in those driving sheets which are peculiar to the North Country.

The Assistance.

The indigenes of Newcastle, being accustomed to the climate, were in no wise deterred from going to Cramlington. The Club said that they wanted 35,000 people to make a real success. They did not get quite that number, but they certainly got something over 20,000. And they might have got more if the approaches to the aerodrome had been easier.

Everybody tried to get there at once at about 14.00 hours—after lunch. The result was that between 14.00 and 15.00

THE HERO OF THE DAY.—Old PT in the S.B.A.C. Race at Cramlington.—("Aeroplane" photograph.)

British Air Triumphs

1918 A Napier-engined D.H. aeroplane climbed to a height of 30,500 feet in 66 minutes. At this time no human being had ever soared so high.

1919 A Napier-engined D.H. aeroplane won the Aerial Derby. Speed 129·3 m.p.h.

1921 A Napier-engined Gloster aeroplane won the Aerial Derby. Speed 163·4 m.p.h.

1922 A Napier-engined Supermarine flying-boat regained the Schneider Trophy for Great Britain at a speed of 149 m.p.h.

1922 A Napier-engined Gloster aeroplane won the Aerial Derby. Speed 180 m.p.h.

1923 A Napier-engined Gloster aeroplane won the Aerial Derby. Speed 192·4 m.p.h.

1926 The first non-stop crossing of South Atlantic ocean carried out by Commandante Franco, flying a Dornier flying-boat with two Napier engines.

1926 First formation flight from Cairo to Cape Town and back to England. Four Fairey aircraft, each fitted with Napier engine, covered 56,000 engine miles without trouble.

1927 Schneider Trophy won by a Napier-engined Supermarine-Napier seaplane flown by Flight-Lieut. S. N. Webster, A.F.C. Speed 281·669 m.p.h. Only two machines completed the course, both Supermarine-Napier seaplanes fitted with Napier engines.

1927 World's speed record over 100 kilometres set up by Flight-Lieut. S. N. Webster, A.F.C. Speed 283·313 m.p.h.

1928 Flight-Lieut. D. D'Arcy Greig, D.F.C., A.F.C., flying Supermarine-Napier seaplane, fitted with Napier engine, set up speed of 319·57 m.p.h.

1928 Capt. H. S. Broad, flying D.H. Hound, fitted with Napier engine, secured three World's speed records whilst carrying loads of 500 and 1,000 kilogrammes.

1928 The greatest formation flight ever carried out was made with four Supermarine-Napier Southampton flying-boats, each fitted with two Napier engines. The machines flew from England to Australia, round Australia and back to Singapore, covering 180,800 engine miles without mechanical trouble.

1929 The first non-stop flight from England to India was carried out with a Fairey monoplane fitted with Napier engine. 4,130 miles in 50 hrs. 38 mins.

hours the long straight road leading to the aerodrome from Newcastle was blocked with cars for well over a mile, and after the show was over the grass verges of the road were still lined with cars, some of them populated and some abandoned by their owners, who had been keen enough to walk to the aerodrome.

If there were 20,000 people who had paid for admission, there must have been at least another 30,000 "hedge-guests" all along the road which runs past two sides of the Aerodrome. A good Northumbrian explained that nobody could grudge these folk their free show, because the Mining Industry has been so bad in the North that the poor things "simply hadn't a bob to pay for entrance," and that their keenness in tramping many miles to see the flying was all to the good as a way of spreading airmindedness. And very good flying they saw.

The net result, in spite of this, was that the Club collected something well over £700 in gate-money, sold over £100 worth of programmes, and raked in about £120 worth of advertising. So that altogether the Club looks like being between £400 and £500 on the right side of its balance-sheet.

Being oneself a Northumbrian, one can write of the Newcastle Club more or less as a member of the family, and so one can say that the Club really deserves its good luck, because it has had the sense to learn the lesson which was taught it by the unholy mess which it made of its first meeting two years ago. That meeting was about the worst-organised thing that ever happened, and last Saturday's meeting was certainly one of the best.

The Flying.

The heats for the Grosvenor Race and the Air League Race had been flown on the Friday, with the results already indicated. The final of the Air League Race—for the handsome cup presented to the League some years ago by Sir Sefton Brancker (as he says, in a moment of indiscretion)—started only a few minutes after Zero Hour.

There was some argument as to whether Mr. J. D. Irving was entitled to second place. A good many people held that he ought to have been disqualified. The loud-speaker—which, by the way, was operated most effectively and intelligently—had said quite clearly that competitors had to fly round the wind-stocking at the south-east corner of the Aerodrome. And Mr. Irving most distinctly flew on the inside of it. But, seemingly, the Stewards held that he had crossed the starting-line correctly, and that what he did afterwards was his own affair.

Consequently, Mr. Todd got the £25 First Prize, Mr. Irving got the £10 Second Prize, and Mr. Thorn, R.A.F., of the Royal Aircraft Establishment Aero Club, only got the £5 Third Prize.

Aerobatics.

The next event, according to the programme, was an Aerobatic Display by Mr. Broad. Unfortunately Mr. Broad was unable to be present, as he had to go to Martlesham for some important tests, so his place was taken by Mr. H. H. Leech, in the Martlet built by the Southern Aero Club with the new A.B.C. Hornet engine (a flat double-opposed four-cylinder).

Those who saw Mr. Leech's amazing flying at the opening of the Hanworth Aerodrome know what his ability is. Certainly the Martlet is a wonderful little machine to handle, and the Hornet engine gives it plenty of spare power. But nobody other than a first-class pilot could make it perform in such wise. But one does wish that he would keep a little further off the ground when he is stunting.

Nobody doubts either his ability or the machine's to do what he does. But he never allows himself any margin for recovery if he should happen to make a mistake owing to a foot slipping on a rudder-bar or the breaking of a control-wire, which is always possible, even in the best aeroplanes. The difference between being fifty feet off the ground and a couple of hundred feet off the ground may just make the difference between a bad crash and a clever landing. And Mr. Leech is too good a pilot to be wasted—apart from the fact that he has cost the country quite a good deal to train, at Cranwell and since.

Still, the display was as good as anything that has ever been seen, and it certainly did impress the crowd enormously.

The Grosvenor Cup.

Following this came the final of the Race for the Grosvenor Challenge Cup, presented to the Royal Aero Club by the late Lord Edward Grosvenor. Here, as already indicated, Mr. G. S. Kemp, the Club Instructor, was first. He won £100, presented by *The Evening World*, the new Newcastle paper owned by Lord Rothermere's group. Dr. Dixon won the £15 Second Prize in the Club's other Moth, QV, with a Cirrus II., and Mr. Alan Goodfellow, of the Lancashire Club, won the £10 Third Prize in the Lancashire Club's Avian, with a Cirrus II. Both the Second and Third Prizes were presented by Sir Charles Wakefield.

The fastest time in this race was done by Mr. R. G. Cazalet in a Widgeon III., with a Cirrus-Hermes engine. Although he was handicapped out of it and finished about fifth, his speed was 111 miles an hour, which shows that, barring specially faked racing machines, the Widgeon is still the fastest light aeroplane. And the Hermes makes a particularly pretty job of it.

The R.A.F.'s Display.

After this the really spectacular event of the day was flown,—a display by No. 29 Fighter Squadron, R.A.F., under Sq.-Ldr. M. L. Taylor, A.F.C., in Armstrong Whitworth Siskins (Jaguar engines).

The wind was distinctly bumpy, and was blowing all the dirt from the collieries over us. But somehow the lowering sky made the display of war machines all the more impressive. And, needless to say, the flying itself was as nearly perfect as anything human can be.

A MEMORY.—The late Lord Edward Grosvenor and his daughters at Lympne on August Bank Holiday, 1925, after presenting his cup to Flt. Lt. Chick, R.A.F.—Mr. Harold Perrin on the left and Mr. (now Sir) Frank McClean behind.—(*"Aeroplane" photograph.*)

Event A was an exhibition of squadron formation flying, including the usual Vee formation, flights astern, echelon to right, squadron Vee, line abreast, and so forth. The wheeling and forming and re-forming was beautifully done, and the squadron flew low, so that everybody had a good look at them as they passed overhead. The only possible criticism is that perhaps the formation kept too much to the east of the aerodrome and did not give the people in the cheaper enclosure at the west end as close a view as they might have had.

Partly because of the bumpiness of the wind, and partly because the Cramlington Aerodrome is distinctly hilly, the squadron broke up and landed independently instead of landing in formation. This was a wise precaution which a less canny leader might have neglected for the sake of showing off.

XXIX.—The squadron in Vee formation. (This picture is seen at its best when held over-head.)
—("Aeroplane" photograph.)

FRIENDS OF THE FAMILY.—The men of the Automobile Association, who are doing such good service at all the flying meetings.

Event B was an exhibition of aerobatics by Mr. R. W. Letchworth. He showed himself to be fully up to the highest standard of R.A.F. piloting. His spinning and rolling in his Siskin was particularly neat.

Incidentally, these manœuvres were very well illustrated in the programme. This, one may add, was printed and produced by M. S. Dodds, of Newcastle, the principal of which firm is Major Brian Dodds, late R.A.F., who, in the early days, was a partner of Mr. Howard Flanders, at Brooklands. The work in this programme is exceptionally good, with modern type, and clean printing.

Event C was an Air Fight between Flt. Lt. O. E. Worsley, late of the 1927 Schneider Team, and Mr. N. E. White. One of the most difficult things in flying is to put up anything that looks like a fight between two exactly similar machines. The performance is apt to degenerate into a kind of follow-my-leader competition, because neither machine can get away from the other, nor catch it. Flt. Lt. Worsley and Mr. White, by skilful manœuvring, managed to put up a show which was full of verisimilitude.

Event D was a Converging Attack on an Encampment by Flt. Lt. E. Brewerton, Mr. John Clarke, Mr. R. W. Letchworth, and Serjeant-Pilot T. W. Morton. Two tents were stuck up on the brow of the aerodrome, where, in this case, the cheaper enclosures had a very good view of them. The flying was excellent, the bombing was quite good, the tents burned furiously, the subsequent machine-gunning was very impressive, and, in accord with the best war practice, after doing their machine-gunning, the machines got away low down over the heads of the crowd in different directions—so low as to make people duck and give them a real thrill. This may be reprehensible, but it certainly brings home the horrors of war,—and it is in accord with proper ground-strafing tactics.

Event E was a demonstration of Combined Aerobatics by Mr. John Clarke and Serjeant-Pilot Morton, the pair who were runners-up in the competition between Fighter Squadrons for the honour of doing this show at the R.A.F. Display at Hendon. This pair did, in fact, perform at Hendon, as well as the winning pair. Their show at Newcastle was every bit as good as their show at Hendon.

"GREAT STUFF THIS GAS."—The advertising ship produced by the Airship Development Company Ltd., which was built in the old R.A.F. airship shed at Cramlington, making its first public appearance.
(*"Aeroplane" photograph.*)

Comic Relief.

Hereabouts we were treated to a display by the little airship which has just been produced by the Airship Development Co., Ltd. The machine, as the photograph shows, strongly resembles a war-time Blimp. It is, however, of completely new construction, and embodies a certain amount of new design.

The envelope was built by the R.F.D. Co., Ltd., of Guildford, and it is a very good job indeed. Mr. Dagnall was in charge of the construction of the envelopes of Airships, Ltd., the lighter-than-air branch of Mr. Holt Thomas' great concern, The Aircraft Manufacturing Co., Ltd., and what he does not know about making airship envelopes is not worth knowing.

When the airship first appeared the R.A.F. people were just about to start their display, so it hung about in the offing nose-down and head-to-wind, with its engine just going ahead enough to keep it stationary over one spot. Its peculiar attitude quite gave the impression that it was trying to dive home to its shed and could not make any headway against the strong wind which was blowing. But as soon as the R.A.F. people had landed and the air was clear, the pilot of the comic little craft opened out his engine and made distinctly perceptible progress over the ground towards the aerodrome.

Whether he ever had his engine flat out or not one cannot say, but the wind aloft must have been doing something well over 30 m.p.h., and the ship was certainly doing another ten or fifteen m.p.h. over the ground against the wind. It seemed to handle quite well, so evidently the people who have to do with it really do know something about airships, which is more than one would care to say about some of the people in British Airships, Ltd., with which certain of them had the misfortune to be associated some years ago.

Judging by the amount of attention which the craft excited on the aerodrome, there certainly is a good deal to be said for the behest "Advertise by Airship," which was the legend on the side opposite to that shown in the photograph. The question is whether the cost of gassing-up and handling even a small airship can be kept low enough to make the business a paying proposition at any possible advertising rates.

The S.B.A.C. Race.

After the R.A.F.'s display, the Race for the S.B.A.C. Challenge Cup was flown. This race is for pilots trained *ab initio* by the Club which enters them. Unfortunately, the only Clubs represented were the London Club, the Lancashire Club, and the Newcastle Club.

As already recorded, Dr. Dixon won the £50 First Prize for the Newcastle Club, Mr. Hofer, of the London Club, won the £15 Second Prize, and Mr. D. Wilson, of the Newcastle Club, won the £10 Third Prize. All these prizes, as well as the cup, were presented by the Society of British Aircraft Constructors.

A New Star.

Following this came a display of aerobatics by Mr. F. Fry, the chief pilot of Cramlington Aircraft, Ltd. Mr. Fry was flying one of the new three-seater Spartans specially built for taxi work, which the Leathart-Runciman firm have just acquired. Considering that the machine is supposed to be a mere taxi, it displayed amazing agility, and Mr. Fry showed himself to be a very clever pilot indeed.

As a matter of fact, he was rather on his mettle because he was a Serjeant-Pilot Instructor in the R.A.F. and had taught several of the officers of 29 Squadron how to fly. So evidently he thought that it was up to him to show that he could still instruct in the art of flying. And he certainly did so.

The next event was a Parachute Descent by the undefeatable Mr. John Tranum, who was taken up in, and dropped from, his brand-new Slotted Moth by Lord Ossulston. One nearly referred to Mr. Tranum as the "irrepressible," but that which is irrepressible is something which cannot be

REJUVENATED.—Mr. R. G. Cazalet's Widgeon with its handsome Hermes cowling.—(*"Aeroplane" photograph.*)

Digitized by Google

THE NORTH.—Left to right, Dr. Dixon and Mr. Kemp, of the Newcastle Club, and Mr. Alan Goodfellow, of the Lancashire Club,—with old PT.—(*"Aeroplane" photograph.*)

stopped from going up, whereas Mr. Tranum simply cannot be stopped from going down—per parachute.

As usual he timed his drop perfectly, and landed precisely in the middle of the aerodrome. Certainly Mr. Tranum is a master of his peculiar art.

As a fitting end to the proceedings, Mr. G. S. Kemp, the Newcastle Club's Instructor, gave a display of aerobatics, quite equal to anything which we had already seen. He certainly showed that where knowledge of flying is concerned, the Newcastle Club can put complete faith in its Instructor.

Northern Hospitality.

The North Country is proverbially hospitable. It has to be, if it is to average up on its reputation for hardness in a business deal. And certainly Newcastle lived up to its reputation for hospitality.

The night before the Meeting, the officers of No. 29 Squadron R.A.F. were entertained to dinner by the Lord Mayor of Newcastle, Alderman Lambert, and they had an excellent time. Meantime, the various visiting pilots, aided and abetted by the members of the Newcastle Club, managed to put in quite a cheery evening together.

A Timely Word.

Hereabouts seems the right place to say a few words on a subject which distinctly needs attention.

Although the majority of the people concerned with Civil Aviation are good sportsmen and good sorts generally, there is unfortunately a certain percentage of hooligans among them—and for the good of the reputation of civil aviators as a class these hooligans ought to be suppressed.

The officers of No. 29 Squadron were stopping at the Turk's Head Hotel, and so were a number of civil aviation people, some of whom apparently put themselves down in the visitors' book as belonging to the R.A.F., on the strength of having served in the Air Force during the War 1914-18.

There seems to have been something of a riot in the Turk's Head, and one room was rather badly wrecked. Next morning the manager of the hotel came to an R.A.F. officer and lodged a complaint that the R.A.F. had done

considerable damage to the hotel's property. He was told that the R.A.F. personnel had been at the Lord Mayor's party, and had had nothing to do with anything that happened in the hotel.

When he was asked what room had been wrecked, the manager indicated a room several floors above those occupied by the R.A.F. officers—all of whom had behaved in a strictly proper manner. Nevertheless, the story got round that these Air Force people had been rioting about the hotel and breaking things up.

Therefore, one makes no excuse for appealing to the better-class people concerned with Civil Aviation to use their influence to stop unseemly behaviour which is likely to give civil aviators a bad reputation. And one advises the R.A.F. in future to take care that they do not stop in the same hotel as the civil aviation people. Nobody objects to a cheery time generally. But there is a big difference between all-round cheeriness and a drunken brawl.

The Club Dinner.

On Saturday night, the Club gave a dinner to the competitors, with Sir Joseph Reed, the President of the Club, in the chair. It was a thoroughly jolly affair, and the Station Hotel did it very well. One gathered from an outside source that the excellent organisation was largely due to Mr. W. L. Runciman. The original intention was that there should be two or three speeches and that people should then have a chance of meeting and talking with each other. But unfortunately the speeches went on and on and on till closing-time.

The Speeches.

Sir Joseph Reed led off with a commendably short speech which was very much to the point. He began by quoting the journalist who was asked what was the difference between a speech and a few words after dinner, the journalist's answer was, "About three-quarters of a column." He said that the Club had to thank the handicappers for providing such good finishes to the races.

He said that Newcastle had to depend on its industry and that he was glad to see new industries springing up. He referred to Cramlington Aircraft, Ltd., whose workshop had overhauled PT so successfully, and to the Airship Development Co., Ltd., whose little engine-driven balloon, which he said was similar to those used early in the War for anti-submarine patrols, we had seen cruising about the aerodrome that day.

He announced that the conditions for the competition for the Trophy which was to be presented to the Club by *The Evening World* would be settled by the Lord Mayor and Sir Sefton Brancker. And he reminded us that Sir Sefton was himself the donor of the Air League Challenge Cup.

Thereafter, by way of entertaining the visitors, the members of the Newcastle Club sang the Tyneside anthem, "Bladon Races." Mr. John Bell, the Secretary of the Club, sang the solo parts and the Club members sang the choruses. It certainly is one of the best local anthems of to-day, and though the twenty-five verses (more or less) only date to about 1840 or so, the tune is in the best folk-song manner, and must be centuries old. Incidentally, Mr. Bell only gave us three verses, which was a pity, for he has a good voice, and exactly the right delivery.

Captain J. H. Boyd, the Chairman of the Club, proposing "The Visitors" in particular, said that the Club was particularly fortunate in having such a galaxy of aviation talent, and included in particular Commander Perrin. He said that the Club had been particularly lucky to be so successful after so much organisation. He thanked in particular those who had helped to make the Meeting a success.

He said that No. 29 Squadron R.A.F. had been selected in particular to represent the Air Force because of their particular talent as aviators. One particular incident on the aerodrome had struck him. He saw three men of the R.A.F. working to start an engine belonging to one of the civil aviators, which showed that they took a particular interest in their work and did not regard it merely as a duty.

He thanked the Press in particular for the amount of publicity they had given the Meeting, and the Automobile Association for seeing to the parking of the aircraft, and the police for regulating the traffic, and the competitors, and the petrol companies, and Mr Tranum, the parachutist, in particular.

Wing-Commander K. R. Park, M.C., D.F.C., replying for the guests, started with a story that deserves to be better known. A number of Christian martyrs were in the arena at Rome to be eaten by lions. Lion after lion was released from its den, and each was met by one of the elders of the Christians, who said a few words to it, after which the lion slunk back to its den. The elder was haled before the Emperor, who promised him his life and liberty if he would explain how he defeated the lions. The elder said that he merely told each lion that he would be expected to say a few words after dinner.

On behalf of the Air Force, Wing-Commander Park said that 29 was merely a representative first-class squadron, in no way superior to its fellows. The success of such squadrons depended on the airmen, and he thanked the Club and the authorities at Newcastle for the hospitality shown to the other ranks in entertaining them and in giving them passes for the North-East Coast Exhibition.

He said that he thought that the hardest-worked men in Civil Aviation were the Club Instructors. And to illustrate his point, he told the story of the fool pupil who showed no air sense. For those who do not know the story, one may record that to teach the pupil that he must learn how to land, the instructor, after telling the pupil that he must do exactly as the instructor did in flying, took up with him a spare control-stick, and after giving the pupil some landing practice, told him that he had got to land the machine himself next time, whereupon he waved the spare stick in the air and threw it overboard—leaving the pupil to think that everything depended on his getting the machine down safely.

To his amazement, the pupil copied him exactly. He stooped down into the cockpit, came up with the control-stick in his hand, waved it, and likewise threw it overboard. Whereupon the instructor followed the sticks overboard with his parachute, leaving the pupil to his fate.

The pupil circled the parachute all the way down and made a perfect landing. When the shocked instructor got to him and demanded what it all meant, the pupil said that he had overheard the instructor's plot, and had himself taken up a spare stick.

Sir Sefton Brancker said that he agreed with the man who said that if speeches had got to be, he would rather listen to himself than anyone else. He admitted having given the Air League Cup to the Air League, but said that it was one of his slips-up.

Concerning the small amount that is known about Civil Aviation officials at present, he said that on the previous morning he had called on Sq. Ldr. Taylor of 29 Squadron at his hotel to discuss with him something about the Meeting, and had sent his name to Sq. Ldr. Taylor by one of the hotel boys. This boy told Sq. Ldr. Taylor that there was a gentleman downstairs who wanted to see him; he had not given his name, but he thought that he was Sq. Ldr. Taylor's banker. Sq. Ldr. Taylor told him that he could not quite understand why his banker from London should call on him in Newcastle at that time of the morning.

Continuing, Sir Sefton said that he was disappointed at the small

ARMSTRONG WHITWORTH
AIRCRAFT

THE ALL STEEL ATLAS

(ON WHEELS, FLOATS OR SKIS)

THE all-steel Atlas is the best aircraft for land or sea reconnaissance.

It is the standard Army Co-operation two-seater of the Royal Air Force.

Its steel construction accounts for its unrivalled durability and ease of maintenance. Fitted with the world-famous Armstrong Siddeley Jaguar engine (plain or geared type), its speed, climb and ceiling fulfil the severest Service requirements. It is produced on the grand scale by the best equipped aircraft works in Europe.

A PLEASING PROSPECT.—Herr Opel's rocket-propelled monoplane performing on Sept. 30.—Such a machine may be one of the attractions at next year's meetings.

number of Clubs represented at the Newcastle Meeting. The only Clubs there were the London Club and the Lancashire Club, which were subsidised, and the Halton Club and the Southern Club, which were not, which seemed to show that unsubsidised Clubs were just as enterprising as those which were subsidised.

Referring to the winning of all the prizes by the Newcastle Club, he said that he really felt that he must be North of the Tweed, and he said that he must have a look at G-EBPT, for its performance suggested that there must be something wrong with its Certificate of Airworthiness.

On behalf of Civil Aviation he thanked *The Evening World* for the £1,200 Trophy which that paper had promised to the Club. He hoped that this would be the first of a series of classic air-races belonging directly to different parts of the country, just as classic horse-races belonged to certain localities.

Miss Winifred Brown, of the Lancashire Club, rising in response to public demand, thanked everybody for a good time, and hoped that they would all be at Newcastle the following year.

Sq. Ldr. Taylor, on behalf of 29 Squadron, said that there had been some wonderful bouquets and also some "raspberries" distributed that night. So far as 29 Squadron was concerned, they were pleased to be selected for this Meeting. They had enjoyed their few hours in Newcastle, which included quite one-and-a-half hours' sleep. He congratulated the Newcastle Club on their fine flying.

He said that he hoped that *The Evening World* Trophy would not be like the Schneider Trophy, but that it would be something which the winner could fill, so that the losers could get some consolation out of it. He also congratulated the Club on the skilful way in which their members land habitually on an aerodrome which is not itself at all brilliant.

Dr. Dixon, also rising in response to public demands, proposed the toast of the Ground Staff, which was duly and deservedly honoured.

Mr. Harold Perrin warned Sir Sefton Brancker that the associated Light Aeroplane Clubs still firmly intended going to the Air Ministry to ask for subsidies after their present term had expired.

Referring to the much-talked-about *Evening World* Trophy, Mr. Perrin said that he was glad to hear that a handsome sum had been collected in Newcastle by exhibiting the Schneider Trophy winner, the Supermarine Rolls-Royce S.6. He said that he hoped that the money would not be spent on an expensive Trophy. Cups were cheap, and he would much prefer to see all the money, except a matter of perhaps £50 or so, invested so as to bring in annually a decent sum of prize-money for the winner.

Hereabouts is one of the really great jokes in Northumbrian aviation, and Mr. Perrin is to be congratulated on letting it out.

Those who have read so far will recall that previous previous speakers had referred to *The Evening World* Trophy as if it were an outburst of spontaneous generosity on the part of that paper, in accord with the late Lord Northcliffe's policy of advertising his papers by means of munificent prizes for flying events, which were duly boosted by the Northcliffe Press. However that may be, apparently the money for this particular piece of munificence has, in fact, been provided by the people of Newcastle themselves.

For the benefit of those who do not already know, the fact must be recorded that *The Evening World* is a comparatively new paper established by Lord Rothermere as an antagonist to *The Newcastle Evening Chronicle*, which belongs to the group controlled by Sir William Berry and Sir Edward Iliffe, the chief paper of which is *The Sunday Times*.

After the Schneider Trophy Contest, *The Evening World*, with typical Harmsworthian shrewdness, managed to borrow the Supermarine Rolls-Royce S6, and installed it in *The Evening World* pavilion at the North-East Coast Exhibition, which has been going on in Newcastle for some months. There a charge of a shilling per head was made for this particular side-show—though what right a newspaper has to charge admission to see a machine which is Government property is a question which might very well be put to the

THE ROCKETEER.—Herr Fritz von Opel displaying the driving apparatus of his machine.

FLOWN AND KNOWN ALL OVER THE WORLD.

Digitized by Google

Secretary of State for Air when Parliament again assembles.

Anyhow, *The Evening Chronicle*, which has for months been carrying on controversies of all kinds of subjects with *The Evening World*, along lines which are simply a highly cultivated version of the kind of slanging-matches in which the newspapers of the Wild Western States used to indulge began to be quite rude about what the Harmsworth Press intended to do with all the money that they were getting out of the visitors to the Exhibition by exhibiting Government property.

And so, finally, *The Evening World* Trophy was announced.

So far as one can gather, the sum available is about £1,250, which represents the money paid for entrance to the peep-show, less the cost of transporting the machine to Newcastle and back and assembling and dissembling it there.

Everybody in aviation will certainly wish that collective and competitive benevolence of a similar nature may be organised elsewhere for the good of Civil Aviation and for the gaiety of the Nation. Properly run, more money could thus be extracted from the British Public than even the hundreds of thousands of pounds which Sir Charles Wakefield, the Patron Saint of Aviation, has given to aviation out of his personal wealth.

Meantime, Northumbria will have a particular interest in *The Evening World* Trophy, because everybody who paid his or her shilling to look at the S.6 will have that pleasing boy-scout feeling about it.

Mr. Alan Goodfellow, of the Lancashire Club, also rising under protest, thanked the Club on behalf of the visiting pilots who between them had won £20, of which £10 belonged to him. He could assure them on behalf of the visitors that G-EBPT looked lovely from behind. He said that he was glad to meet 29 Squadron again, because when he knew the Squadron in the R.F.C. at the time of its birth it succeeded in getting one-and-a-half aeroplanes to France.

Apropos somebody's opulence or munificence, or something, he told an excellent story of a man who had acquired considerable wealth by being concerned in one of the great city swindles, and was living in style on the proceeds after coming out of prison. While he was celebrating his release with a number of his friends his butler brought word that there was a man in the hall who wanted to see him and claimed to have been a friend of his in Wormwood Scrubbs Prison. The host went out, and returned in a few minutes very angry and said to his guests: "That chap's a dead wrong 'un. He was never in Wormwood Scrubbs at all."

Mr. A. Weir MacColl, of the Airship Development Co., Ltd., thanked the Club for inviting him to the Dinner, and assured them that, contrary to the account which had been published in one of the local evening papers, the engine of the airship had not broken down, and that its tail was not drooping that afternoon. On the contrary, its tail was well up. He said that he hoped to do for the small airship what the Club was doing for light aeroplanes.

Finally, rising under protest, not being a speechmaker, and not being a guest of the Club, but of an individual member, and being on one's native heath, so to speak, one suggested that the hour was then too late for speechmaking, and that the company would probably much rather adjourn to their individual ideas of amusement. So that was that.

As a matter of fact, the whole thing was a jolly good show. The date chosen was obviously wrong. That could not be helped, because, owing to annual training which culminates in the R.A.F. Display at Hendon and the leave season which comes immediately after, a performance by an R.A.F. Squadron could only be had before the end of May or after the end of September. And the Club very sensibly relied on the R.A.F. as the chief attraction to draw the crowd. In which undoubtedly the Committee were fully justified.

The Club has profited by its earlier mistakes, and even before this Meeting it was in a financially sound position, possibly very largely due to the fact that it has been extraordinarily lucky in the matter of crashes.

It has an excellent Instructor, and first-class Ground Engineers, and it has on its aerodrome Cramlington Aircraft, Ltd., a thoroughly enterprising young firm with excellent equipment, which is able to do repairs promptly and cheaply when they are outside the scope of the Club's own workshop.

The present Committee are hard-working and energetic. And having this particular stroke of luck about the weather, the Club now has money in hand.

One can only hope that the money will be spent with true North Country caution and effectiveness, and that next year the Club will find itself in a still better and stronger position.—C. G. G.

FRENCH DIESEL ENGINE EXPERIMENTS.

Last week a Morane-Saulnier monoplane fitted with a Clerget-Diesel engine running on gas oil was demonstrated at Villacoublay before M. Laurent Eynac, the French Air Minister, M. Caquot, *Directeur Général des Services Techniques et Industriels*, and *Inspecteur-Général* Fortant.

So far as is known these preliminary tests have been satisfactory.

RECOGNITION BY THE R.Ae.C.

In recognition of the flight to India and back the Royal Aero Club has awarded its Gold Medal to Mr. C. D. Barnard, and an address of congratulation has been sent to Her Grace The Duchess of Bedford.

Mr. Barnard, accompanied by the Duchess of Bedford, accomplished the flight in eight days, Aug. 2 to 9, 1929, in a Fokker monoplane, with a geared Bristol Jupiter engine. The distance covered was approximately 10,000 miles.

[This award, especially in view of the fact that the journey was done in a foreign aeroplane, shows that the Aero Club Committee has developed a very proper sense of relative values.—C. G. G.]

LLOYD'S REGISTER OF AIRCRAFT.

Civil aircraft are at last to be placed on the same basis as shipping and will be registered at Lloyd's.

The Aeroplane of July 3 and July 10 referred to the formation by the British Aviation Insurance Group of an inspection department for the renewal of Airworthiness Certificates of Light Aeroplanes. The arrangement was that machines would be inspected every three months for insurance purposes. The reports of such inspections would be considered by the Air Ministry at the end of the year. If these reports were satisfactory, the Air Ministry would issue a renewal of the Certificate.

The Committee of Lloyd's Register of Shipping have now taken over the work till recently done by the British Aviation Insurance Group.

The Committee have appointed Mr. L. J. Hill, to be Lloyd's Surveyor of Aircraft. Mr. Hill has hitherto done this work for the British Aviation Insurance Group.

Besides the inspection of aircraft for insurance purposes and collaterally for the renewal of Airworthiness Certificates, the new department of Lloyd's Register will be available for the inspection of damaged aircraft. This inspection will determine the condition of the damaged machine, and the nature and extent of the necessary repairs.

A strong Aviation Committee is being formed at Lloyd's. This will include representatives of underwriters, aircraft constructors, owners of aircraft and members of organisations devoted to Aviation.

CLASSES FOR NAVIGATORS.

The following letter is important to all who aspire to become qualified Master Pilots of Aircraft:—

Sir,—The next examination for the first and second class Air Navigation Licenses will be held in April, 1930, and I have been requested by the Guild of Air Pilots and Navigators to act as honorary organiser for the next class until such time as the Guild is in a position to take over these duties.

The Air Ministry have kindly loaned instruments and tables required for this class, and the Royal Aeronautical Society have also kindly offered the use of their library at 7, Albemarle Street, W.1.

It is proposed to hold the class on Monday evening of each week from the end of October until January, and from the end of January twice weekly on Mondays and Fridays from 6—7.30 on each night.

The class will be conducted by Mr. C. B. Collins of the Air Ministry and Squadron Leader E. L. Johnston, A.F.C., of Cardington. Capt. Entwistle of the Air Ministry will also assist with Lectures on Meteorology.

The fee for the whole course of Lectures will be 5 guineas and members will also be required to be responsible for wear, tear, loss or damage to instruments, tables, etc., on loan from the Air Ministry.

As the class will be strictly limited intending applicants are requested to write at the earliest opportunity to me, enclosing their cheque for the necessary fee.

(Signed) A. G. Lamplugh (Capt.),
c/o British Aviation Insurance Group,
3/4, Lime Street, London, E.C.3.

A SYMPTOM.

Towns, municipalities, cities, and other conglomerate edifices housing the human species are known to possess semi-souls of their own and exhibit jealousy of each other. Certain omens begin to warn those who look forward that a healthy rivalry and pride is beginning to develop over the municipal aerodrome.

On Oct. 1 the Society of Bristolians held a dinner in London at which were present the Lord Mayor and Lady Mayoress of London.

At this function the President of the Society said that he thought the City Aerodrome well worth the attention of those present, and explained the widespread aeronautical ambitions of Bristol.

There is no doubt that Mayors and their Corporations all over Britain are thinking about aerodromes and are realising how important is the provision of a municipal air-park. This is good, because without municipal aerodromes there can be no boom in Aviation. Hence The Aeroplane's Special Air Park Issue, which is to appear on Oct. 23.

TO THOSE WHO FLY TO IRELAND.

Air Ministry Notice No. 61 of the year 1929 is addressed to those who may want to fly to Ireland across the Irish Sea. Such adventurers must adhere strictly to the full procedure outlined in *The Air Pilot*, Vol. I, Part 2, Sec. 5.

ORDER THE SPECIAL AIR-PARK ISSUE IN GOOD TIME.

THE BUSINESS MEN'S CHOICE

To the man who owns an Avro 5, England is a suburb of London, and Europe—its home counties. He can travel at any time to any place in comfort, safety and privacy. Three 100 h.p. Armstrong Siddeley engines give it a cruising speed of 100 m.p.h. The cabin is comfortably furnished and ventilated and equipped with everything necessary for comfort, including electric light. The machine can land in 330 yards and may be left exposed to all weathers.

The Avro 5 is reliable and fast. It is the natural answer to the modern demand for increased comfort and saving of time.

AVRO·5

(3 ENGINED MONOPLANE)

Specifications and full particulars of the above, also of the larger Avro-10 (carrying 8 passengers) will be supplied on application. Those interested should write for free catalogue of the famous "Avian" light aeroplane.

WORLD'S RECORDS.

The Official Reports in connection with the following performances have been considered by the Committee of the Royal Aero Club, and they are to be submitted to the F.A.I. for acceptance as World's Records:—

100 *Kilometres on a Closed Circuit.*

Sept. 7, 1929. Flg. Off. H. R. D. Waghorn, Supermarine-Rolls-Royce S.6. Speed—330.1 m.p.h. = 531.2 k.p.h.

Sept. 7, 1929. Flg. Off. R. L. R. Atcherley, Supermarine-Rolls-Royce S.6. Speed—331.6 m.p.h. = 533.8 k.p.h.

Greatest Speed over 3 Kilometre Course:

Sept. 10, 1929. Flt. Lt. G. H. Stainforth, Gloster-Napier VI. Speed—336.3 m.p.h. = 541.1 k.p.h.

Sept. 12, 1929. Sq. Ldr. A. H. Orlebar, Supermarine-Rolls-Royce S.6. Speed—357.7 m.p.h. = 575.7 k.p.h.

A NEW DISTANCE RECORD?

On Sept. 27 MM. Costes and Bellonte left Le Bourget in a Breguet biplane (600 h.p. Hispano-Suiza engine) in an attempt to beat the World's Distance Record. The machine carries 5,200 litres (1,140 gallons) of petrol and 180 litres (39½ gallons) of oil, or enough for 45-50 hours and 9,000 kms. (5,625 miles).

The machine took off in 51 secs. and disappeared into the fog in an easterly direction. No wireless apparatus was carried and the passage of the aircraft over Germany and Russia-in-Europe was unobserved. It was variously reported to have been seen over Asiatic Russia but none of these messages was confirmed.

On Oct. 6 a telegram was received at Mukden stating that an aeroplane manned by two foreigners claiming to be Frenchmen had made a landing in Northern Manchuria. The machine was out of petrol and was slightly damaged but the crew was safe.

On the same day the French Government received confirmation from the French Consul at Mukden that MM. Costes and Bellonte had landed at Tsitsihar, 200 miles N.W. of Harbin, Manchuria, on Sept. 29.

The following telegram from M. Costes has been transmitted from the French Legation at Peking to Paris:

We landed on Sept. 29 in a deserted region of the Province of Kai-lung-chang [Heilungkiang], having covered 9,610 kilometres [about 5,968 miles] in direct flight and thus breaking all records. It took us a week to reach Tsitsihar, where we arrived on Oct. 6.

Their point of landing is now given as Kannan in the Heilungkiang province, 50 miles from Tsitsihar and 260 miles from Heiho. They travelled to Tsitsihar under guard, as they had no visas and they were mistaken for Russians by the local soldiery. Chang Hsueh-Liang, the Governor of Manchuria, gave orders for their release as soon as their identity was discovered.

The distance covered as given in the telegram above seems open to question. The Great Circle course from Paris to Tsitsihar is about 4,900 miles. They may have covered 5,968 miles in flying a zig-zag course across Europe and Asia to take advantage of the best atmospheric conditions and to avoid unfavourable country but for the purposes of the World's Distance Record the Great Circle distance between the points of departure and landing is the only one recognised.

The previous World's Record was held by Capt. Ferrarin and the late Major del Prete, who on July 3-5, 1928, flew from Rome to Natal, Brazil, in a Savioa S-64 monoplane (550 h.p. Fiat A-22 engine) a distance of 7,136 kms. (4,420 miles).

THE HULL AIR DISPLAY.

An Air Ministry *Notice to Airmen* states:—

Between the hours of 13.20 and 17.20 on Oct. 10, an Air Display will be held at Hedon Aerodrome, Hull.

Pilots are requested not to land at this aerodrome between the hours of 13.20 and 17.20 on that date, and, in order to avoid collision with R.A.F. and civil aircraft taking part in the Display, they are asked to refrain from flying in the vicinity of the aerodrome in question.

Pilots of aircraft visiting the aerodrome are requested to arrive before 13.20 hours, and no machine may leave the aerodrome or take off until after 17.20 hours.

AN AFFAIR AT THE HESTON AIR PARK.

On Oct. 7 at Brentford Cecil Cornelius Arthur Morrison, 24, and Roland Pascoe Deacon, 21, were committed for trial at the Central Criminal Court charged with being concerned in breaking and entering Heston Air Park on Sept. 28.

Deacon had previously been remanded so that Morrison who had been in hospital suffering from bullet wounds in the leg, alleged to have been inflicted by the night-watchman of the Air Park, could be brought up with Deacon.

THE SINO-SOVIET FRACAS.

Reuter states that Soviet aeroplanes made three separate attacks against the town of Manchuli on Aug. 2. Six bombs were dropped and the Soviet aircraft used their machine-guns against the Chinese.

THE AUSTRALIAN EAST—WEST RACE.

The Australian Trans-continental Air Race from Sydney to Perth started, as was reported in The Aeroplane last week, on Sept. 30. Of the original 27 entries 17 started. The distance to be covered was 2,450 miles. This had to be covered in twelve stages, spread over a period of six days.

The first day's stage was from Sydney to Melbourne. The first arrival was Mr. Miller in a D.H.9, followed by Major Hereward de Havilland in a Gipsy-Moth and Mr. C. D. Pratt, also in a Gipsy-Moth. On handicap Mr. Pratt was first, Mr. Miller second, and Mr. Bardsley, in a Gipsy-Moth, third. Major de Havilland was placed sixth.

No information is available concerning the second day's stage, from Melbourne to Adelaide.

The third day's flying was from Adelaide to Ceduna, 350 miles N.W. of Adelaide. All seventeen starters reached Ceduna, with Mr. Miller and Major de Havilland first and second respectively.

A Klemm monoplane, flown by Mr. Baker, which was forced to land on the previous day lost so much time that it arrived at Ceduna too late to start on time for the next stage and was disqualified from competing for the main prize.

The next stages were from Ceduna to Forrest, from Forrest to Kalgoorlie and finally from Kalgoorlie to Perth.

The final stage was marred by an accident to Mr. Pratt. He was flying low over dead-flat country when he hit the top of a dead tree The machine was completely wrecked, and the occupants, Mr. Pratt and his passenger, Mr. Guthrie, the owner of the machine, were severely injured.

Fifteen machines reached Perth on Oct. 5 in stormy weather. Mr. H. C. Miller in a D.H.9 won the first prize of £1,000, and Major de Havilland, in a Gipsy-Moth, the second prize of £300.

Their total flying times from Sydney to Perth were 23 hrs. 58 mins. 31 secs. and 23 hrs. 50 mins. 23 secs. respectively. Mr. A. T. Cunningham, flying a Gipsy-Moth, was reported as having won the prize for the fastest time, but this has been contradicted by later dispatches.

The following telegram has been received by the De Havilland Aircraft Co. Ltd.:—

Fastest time East-West Race put up by Major de Havilland flying special single-seater Gipsy-Moth, averaging 107 over race 2,450 miles, with D.H.50 second and D.H.9 third. Handicap won by Capt. Miller flying D.H.9, with Major de Havilland second, and other Gipsy-Moths occupying third, fourth and fifth places. Most severe race through terrible wind, rain and dust storms. Ten Gipsy-Moths started, and nine finished.

[Congratulations to the one British aircraft firm which has really laid itself out to get business in civil aircraft overseas. Such a sweeping success in a race of World-wide importance should give the firm a splendid advertisement. And, be it said, the advertisement is well deserved, for if there are better-built aircraft than those produced by the De Havilland firm they have still to be discovered.—C. G. G.]

AN AUSTRALIAN MINISTERIAL TOUR.

The Hon. C. L. A. Abbott, Commonwealth Minister for Home Affairs, has recently completed an aerial tour of the Northern Territory. The tour was made in a D.H. Giant-Moth (Bristol Jupiter engine) piloted by Mr. L. H. Holden.

The total distance covered was 5,591 miles and the route followed was by way of Sydney, Narromine, Charleville, Cloncurry, Brunette Downs, Victoria River Downs, Wyndham, Darwin, Newcastle Waters, Alice Springs, Oodnadatta, Adelaide, Canberra and back to Sydney.

The machine used was the one Mr. Holden used in his successful search for the *Southern Cross*. On the tour, full wireless equipment, two emergency water tanks each holding six gallons, and a large supply of emergency rations were carried.

Except for halts of two days at Darwin, one day at Adelaide, and half a day at Alice Springs and Wyndham an average of 500 miles per day was maintained.

AN AUSTRALIAN AIR M.P.

Mr. T. W. White, T.D., one of the original members of the Australian Flying Corps, and author of "Guests of the Unspeakable," has been successful in contesting Canberra in a recent election, and thus becomes the first ex-Service aviator to be returned to the Australian Parliament, either Federal or State.

In "Guests of the Unspeakable" Mr. White outlined the early history of military aviation in Australia, and later describes his experiences in Mesopotamia with the first A.F.C. Squadron, and as a prisoner of war with the Turks. These experiences were later shared with "Contact" (Alan Bott, M.C.), when the two combined in an escape from Turkey into Soviet Russia. These later experiences are also described in "Contact's" book, "Eastern Nights and Flights."

ORDER THE SPECIAL AIR-PARK ISSUE IN GOOD TIME.

THE ROYAL AIR FORCE.

The London Gazette.

October 1.

ROYAL AIR FORCE.

GENERAL DUTIES BRANCH.—The following Flg. Offs. are granted perm. comns. in this rank (Oct. 1):—D. F. W. Atcherley, G. D. Harvey.

The following Plt. Offs. on probation are confirmed in rank (Sept. 14):—A. G. Adnams, A. F. P. Anning, C. M. Champion de Crespigny, G. H. Clarke, E. W. Downing, H. A. Fenton, H. R. Hughes-Hallett, A. E. Louks, D. S. McDougall, L. P. Rowley, J. S. Shakespeare. Plt. Off. R. David is promoted to the rank of Flg. Off. (Jan. 9) (substituted for the notification in the *Gazette* of July 16).

The following Plt. Offs. are promoted to the rank of Flg. Off.:—C. E. V. L'E. Feasey (Jan. 18); E. G. Banham, W. J. Crisham, J. H. Lock, R. Mountain, J. B. W. Pugh (Sept. 16). Flg. Off. E. G. Hordern is placed on the half-pay list, Scale B, Sept 6, 1929, to Jan. 15, 1930, inclusive.

The following are placed on the retired list on account of ill-health:—Flt. Lt. E. K. Blenkinsop (Sept. 23); Flg. Off. H. T. Satterford (Oct. 1). The following Flg. Offs. are placed on the retired list at their own request (Oct. 1):—R. B. Harnden, W. Morgan, E. Smith. Flg. Off. E. C. Foreman is transferred to the Reserve, Class A (Sept. 20); Flg. Off. E. M. Thomas resigns his perm. comn. (Oct. 1). The S.S. comn. of Plt. Off. on probation W. J. Hodge is terminated on cessation of duty (Oct. 1).

STORES BRANCH.—The following Flg. Offs. are granted perm. comns. in this rank (Oct. 1):—E. G. M. Charleson, H. M. S. Dawes, G. H. Doveton, F. W. Felgate, P. J. Mote, L. Taylor.

MEDICAL BRANCH.—Flt. Lt. E. J. Jenkins resigns his perm. comn. (Sept. 19).

CHAPLAINS BRANCH.—The Rev. S. H. Keen is granted a perm. comn. as a Chaplain with the relative rank of Grp. Capt. for duty as Staff Chaplain (Wesleyan) (Sept. 12).

RESERVE OF AIR FORCE OFFICERS.

GENERAL DUTIES BRANCH.—C. R. Robbins is granted a comn. in Class A as a Flg. Off. on probation (Sept. 20); Plt. Off. on probation D. H. Duder is confirmed in rank (Sept. 3). The following Plt. Offs. of the Special Reserve are promoted to the rank of Flg. Off.:—G. D. S. Horsfall (July 2); J. F. R. Hunter, W. O'B. Knox (July 27). Flg. Off. A. C. Heaven, M.C., relinquishes his comn. on completion of service (Sept. 30).

AUXILIARY AIR FORCE.

GENERAL DUTIES BRANCH.—No. 601 COUNTY OF LONDON (BOMBER) SQUADRON.—The Right Hon. Sir Philip A. G. D. Sassoon, Bt., G.B.E., C.M.G., M.P., to be Squadron Leader and to command the squadron (Sept. 23).

The Operations in Afghanistan.

A detailed Report on the Air Operations in Afghanistan is contained in Command Paper 3400 published on Oct. 7, 1929, by H.M. Stationery Office.

The Paper is divided into two sections, (1) A copy of a letter from His Excellency the Commander-in-Chief in India to the Secretary to the Government of India, Army Department, dated Simla, April 21, 1929. (2) A report by Sir W. G. H. Salmond, K.C.B., K.C.M.G., D.S.O., Air Officer Commanding, R.A.F. (India), on the Kabul Evacuations.

The Commander-in-Chief's letter is as follows:—

I have the honour to forward, in original, a letter No. 8687/73/29/Air, dated the 21st March, 1929, from the Air Officer Commanding, Royal Air Force in India, enclosing a report on the air operations in Afghanistan between 12th December, 1928, to 25th February, 1929.

2. These operations, as will be seen, were carried out with complete success in exceedingly difficult and dangerous conditions. On several occasions the machines flying to or over the British Legation were fired upon, and in one case a machine was compelled to descend. The climatic conditions and the nature of the terrain added very greatly to these difficulties and dangers. The whole series of operations were carried out with a skill and gallantry that reflect the utmost credit upon the officers and other ranks of the Royal Air Force engaged in them. They were not, however, strictly speaking, military operations; and I propose therefore that neither the report of the Air Officer Commanding nor this letter should be regarded as a military dispatch.

3. I fully concur in the observations of the Air Officer Commanding in paragraphs 2 to 6 and Appendix "A" of Part IV of his report. Of the officers and other ranks mentioned in the Appendix, the services of the following have already been recognised by the grant of the decorations above their names:—

The Air Force Cross—

Squadron Leader R. S. Maxwell, M.C., D.F.C., Flight Lieutenant D. F. Anderson, D.F.C., Flight Lieutenant R. Ivelaw-Chapman, D.F.C., Flying Officer L. H. Anness, Flying Officer C. W. L. Trusk.

The Air Force Medal—

358520 Leading Aircraftsman G. Donaldson.

Where all have done so well, it is difficult to single out any further names for special commendation. I desire, however, to record my high appreciation of the services of the Air Officer Commanding, Air Vice-Marshal Sir W. G. H. Salmond, K.C.B., K.C.M.G., D.S.O., whose capable administration of the Royal Air Force in India during the last two years is amply demonstrated by the smoothness and efficiency with which the force carried out its strenuous and unprecedented task: and of Group Captain R. P. Mills, M.C., A.F.C., who superintended the operations and displayed the greatest ability and resource in doing so. I desire also to express my obligation to Air Vice-Marshal Sir R. Brooke-Popham, K.C.B., C.M.G., D.S.O., A.F.C., Air Officer Commanding, 'Iraq, for the promptitude with which the Victoria aircraft were mobilised and despatched to this country.

Sir Geoffrey Salmond's Report is submitted in five parts under the following headings:—

Part I gives an outline of the recent history of Afghanistan in so far as it concerns these operations.

Part II shows the strength of the Royal Air Force available in India and the acquisition of reinforcements.

Part III is a chronological survey of the operations in four phases.

Part IV contains certain lessons deduced from these operations.

Part V consists of general observations and recommendations.

All those who are interested in the work of the Royal Air Force should buy and read this Report, which is too long to be reproduced in THE AEROPLANE.

Copies may be had from THE AEROPLANE Book Dept., Cannon House, Pilgrim Street, E.C.4, for 10d. each, post free.

The High Commissioner for 'Iraq.

Sir Francis Humphreys, who was Resident British Minister at Kabul, Afghanistan, until the end of last year, when he and his household and many others were rescued by the R.A.F., has been appointed High Commissioner for 'Iraq in succession to the late Sir Gilbert Clayton.

THE HAWKER-HARRIER.—A new Day Bomber built by the H. G. Hawker Engineering Co. Ltd. It is fitted with a Bristol Jupiter VIII geared engine.—(*R.A.F. Official photograph.*)

Digitized by Google

No. 6 (Army Co-operation) Squadron.

No. 6 (Army Co-operation) Squadron, R.A.F., which has been stationed at Mosul, 'Iraq, since June, 1924, is moving, this month, to Moascar, Egypt.

This move is not actually a reduction of the strength of R.A.F. Units in 'Iraq because No. 203 (Flying-Boat) Squadron has been posted to Basrah since the establishment was reduced to five Squadrons.

No. 6 (Army Co-operation) Squadron is equipped with Bristol Fighters and is commanded by Sq. Ldr. C. Hilton Keith.

Defending the Realm.

An Air Ministry Weekly Order draws the attention of all pilots to the fact that several instances have recently been reported of articles having been thrown from aircraft in flight. As such action is dangerous to life and property, crews of, and passengers in, aircraft are forbidden to jettison any articles whatever when flying over land, except when such a course is necessary in an emergency. Such articles as empty Very pistol cartridges, etc., are to be retained and disposed of after landing.

Special Assessments.

The Regulations governing the award of Special Assessments to officers who pass out exceptionally well from a course of *ab initio* flying training have been altered in the recent Amendment List to King's Regulations and Air Council Instructions. The Regulations now read:—

Special Assessments, as shown below, will be awarded by the Air Ministry on the recommendation of the air or other officer commanding to officers who pass out exceptionally well from a course of *ab initio* flying at a flying training school or unit.

(a) *A Distinguished Pass*, which will be known as "D," will be awarded to officers who pass well out of the school and who have shown particular keenness and attention to duty throughout the course. It will not be given to any officer who obtains less than 80 per cent. of the marks for the written portion of the examination on passing out.

(b) *A Special Distinction*, which will be known as "S.D.," will be awarded in rare cases to an officer who does exceptionally well, shows unusual ability, and has displayed great keenness and attention to his work. It will not be given to any officer who obtains less than 90 per cent. of the marks for the written portion of the examination on passing out.

The fact that an officer has been awarded "S.D." or "D." will be taken into special consideration when questions of appointment to medium service or grant of permanent commissions are being dealt with.

An officer who obtains a "special distinction" or "distinguished pass" will be exempted from the examination to the rank of flying officer.

Headquarters, R.A.F., India.

Headquarters, R.A.F., India, will move from Simla to New Delhi on Oct. 21, 1929. The full address is: Royal Air Force, Imperial Secretariat, South Block, New Delhi, India.

A Dress Regulation Amendment.

A recent Amendment List to King's Regulations and Air Council Instructions for the Royal Air Force states:—

It is left to the discretion of the C.O. of the station to permit plain clothes to be worn at the station by the following when not on duty:—(a) Officers, warrant officers and flight serjeants. (b) Serjeants in possession of two good conduct badges or in special cases those who have held commissioned rank in previous service. (c) Other airmen for purposes of recreation.

Permission may be given by a C.O. to warrant officers and N.C.O.s and to aircraftmen of "V.G." character to dress in plain clothes while on leave or pass away from their station for a period of over 48 hours.

Another Amendment states that airmen may leave the top button of the greatcoat undone with the lapels folded back when "walking out." If the weather be warm the coat may be carried over the arm.

Science and Technology.

The following officers who were selected for the University Course "B," which began in October, 1928, have satisfactorily completed the course, and have been awarded the Diploma for Advanced Study of the Imperial College of Science and Technology:—

Flt. Lt. A. F. Scroggs and Flt. Lt. F. E. Vernon.

What Happened.

Much publicity was given in the Sunday newspapers to an incident which happened on Oct. 5 at the R.A.F. Aeroplane and Armament Experimental Establishment at Martlesham Heath. The true story is this:—

A Westland IV, piloted by Flt. Lt. S. N. Webster, A.F.C., with two passengers, had just completed her full Airworthiness Tests, passing them at a load of 5,750 lbs.—which gives the machine a useful load for passengers and crew of 1,100 lbs. The Westland IV also carries complete navigation equipment, wireless, lavatory, and luxurious furnishing. In taking off on the last test a pin sheared in the oleo leg and allowed the wheel and axle to swing beneath the fuselage out of sight of the pilot, who thought he had lost them. Flt. Lt. Webster flew across the aerodrome several times, to give the passengers time to lighten the machine of all the ballast, and then climbed to about 2,000 ft., turned off the petrol and ran the collector-box dry. He then glided the machine down and made a perfect landing on the starboard wheel.

Contact with the ground caused the hanging wheel and axle, which he did not know were there, to swing into position again, and the machine actually landed on both wheels, though with a considerable list to port.

The wheel kept the machine off the ground, and very little damage was done. The low landing-speed and the controllability of the machine materially helped what was in fact a very well-judged display of piloting.

[A similar feat was performed recently by Mr. Youell, of Imperial Airways, with an Argosy full of passengers, and some years ago by the late Mr. Carter with a Bristol ten-seater.—C. G. G.]

The R.A.F. Memorial Fund.

The total amount of grants made to past and present members of the R.A.F. by the R.A.F. Memorial Fund from July 1, 1929, to Sept. 30, 1929, was £3,064 16s. 5d.

The number of cases dealt with by the office of the Fund during that period was 340.

The grants have been administered, generally speaking, under the heads of maintenance during sickness, grants of loans to establish small businesses, grants of clothing for men and families, payment for tools, rail fares, payment of arrears on rent, insurance, etc., accommodation, maintenance, funeral expenses, and grants to redeem pawned goods.

Movements of R.A.A.F. Officers.

Sq. Ldr. A. H. Cobby, D.S.O., D.F.C., who has completed a course at the R.A.F. Staff College, returned to Australia on Oct. 8, after an absence of three years.

Sq. Ldr. H. C. Harrison will leave England at the end of this year for Australia, proceeding by way of the U.S.A., where he will break his journey to study the technical development in aeronautics.

Flt. Lt. A. M. Charlesworth has completed a long Photographic Course at Farnborough and will leave England in November with an R.A.F. Survey Party on a three-months' survey of Somaliland. He will reach Australia in March 1930.

Sq. Ldr. T. R. Marsden, D.S.O., has left Melbourne, in accordance with a recommendation in Air Marshal Sir John Salmond's Report that a Senior Stores officer should spend one year in England.

Pioneering By Air.

Two Westland Wapitis of the R.A.A.F. are engaged on a Survey of some 30,000 square miles of Central Australia. The personnel of the Expedition are Flg. Offs. F. J. B. Wight and A. G. Gerrand, one fitter, one photographer, and one wireless operator, R.A.A.F., and Mr. C. T. Madigan, who, in the absence of Sir Douglas Mawson, occupies the Chair of Geology in the University of Adelaide.

The particular area to be surveyed has never been explored, and, so far as is known, has never been traversed by either whites or blacks. Four rivers disappear into this area and their courses have never been followed to their sources. Sandhills prevent approach by car, and the condition of the interior is unknown.

If the aerial survey proves promising from a geological aspect the Royal Geographical Society intends to send out a properly equipped expedition next year.

A Re-Union of No. 28 Squadron.

The Annual Re-Union of No. 28 Squadron, R.A.F., Old Boys' Association, will be held on Oct. 19 at the White Horse, Holborn (near Holborn Tube Station), at 6 o'clock for 6.30.

The Re-Union, which will take the form of a supper party, coincides with the first Saturday of the Motor Show at Olympia, and advantage can be taken of the cheap excursions.

The tickets are 3s. 6d. each, and men friends can be invited. Application for tickets should be made as soon as possible to the secretary, C. T. Hodges, 102 Camden Street, N.W.1.

The R.A.F. Football Association.

The general committee of the R.A.F. Football Association for 1929-30 has been formed under the Chairmanship of Wing Cdr. C. C. Miles, M.C., who is also R.A.F. Representative on the Council of the Football Association. The Hon. Secretary is Flg. Off. D. W. Sugden, R.A.F., North Weald. The Hon. Treasurer is Flg. Off. J. M. Hopkins, R.A.F., North Weald. The Hon. Secretary, Referee's Committee, is Flt. Lt. W. R. Castings, M.B.E., Air Ministry. The other members of the Committee are Flt. Lt. N. Keeble, D.S.C., D.F.C., Flg. Off. W. F. Quillam, Sq. Ldr. M. B. Frew, D.S.O., M.C., A.F.C., Flt. Lt. J. Oliver, A.F.C., Flt. Lt. G. A. Hadley, and S. M. Anderson.

ICTORY FOR MOTH

ENITH

– FIRST

ULL THROTTLE

ps for refuelling) 112½ m.p.h.

the hands of Captain H. S. Broad, Moth gained an overwhelming umph in the International Speed Contest round France, organised the Aero Club de France, for the Zenith Cup, presented by the ciété du Carburateur Zenith. Captain Broad flew the identical Moth hich was entered by Sir C. C. Wakefield, Bart., in the 1929 King's up Race, converted in this instance to a two-seater, and averaged, th an entirely standard Gipsy engine, a speed of 112½ m.p.h., cluding five stops for refuelling, over the circuit Paris—Tours—rdeaux—Toulouse—Marseilles—Lyons—Paris.

This magnificent achievement is yet another example of the out-nding performance and reliability of the Moth, which have earned it a universal reputation as the "Best Light Aeroplane in the World."

The District Representatives are:—

Eastern, Flt. Lt. S. N. Webster, A.F.C., Martlesham Heath; *Kent*, Flt. Lt. J. Walker, Eastchurch; *London*, Flt. Lt. N. Keeble, Uxbridge; *North Midland*, Flg. Off. Owen, Digby; *Southern*, Flt. Lt. L. J. Chandler, M.B.E., Lee-on-Solent; *South Midland*, Flt. Lt. V. Croome, Halton; *Wessex*, Flg. Off. W. F. Quillam, Upavon; *Western*, Flt. Lt. W. R. Westcombe, Shrewsbury.

The representative fixtures for the season are:—

Oct. 16, "A" team v. R.A.F. College at Cranwell. Oct. 30, v. Hampshire at Aldershot.

Nov. 9, v. Cambridge University at Cambridge. Nov. 13, v. Oxford University at Wycombe. Nov. 20, v. London University at Henlow.

Dec. 11, v. Spartan League at Uxbridge.

Jan. 8, v. Middlesex at Uxbridge. Jan. 9, v. Football Association XI at St. Albans. Jan. 18, v. Corinthians at Crystal Palace.

Feb. 12, v. Civil Service at Chiswick. Feb. 22, v. Wycombe Wanderers at Wycombe.

Mar. 15, v. Army at Homerton. Mar. 29, v. R.N. and R.M. at Millwall.

April 2, Senior Cup Final. April 9, Junior Cup Final.

The R.A.F. College.

A Rugby football match will be played at Cranwell on Oct. 16 between Past and Present Cranwellians. Flg.-Off. G. R. Beamish, the captain of the R.A.F. team, will select the Past team.

Water Polo in 'Iraq.

The final placings in the Hinaidi Water Polo League are as follows:—

(1) No. 70 (Bomber) Sqdn. played 20, won 19, drew 0, lost 1, goals for 76, against 4, points 38.

(2) "B" Depot Sqdn. played 20, won 17, drew 1, lost 2, goals for 67, against 12, points 35.

(3) "C" Depot Sqdn. played 20, won 15, drew 1, lost 4, goals for 50, against 24, points 31.

(4) "D" Depot Sqdn. played 20, won 12, drew 3, lost 5, goals for 37, against 25, points 27.

(5) "A" Depot Sqdn. played 20, won 9, drew 3, lost 8, goals for 29, against 32, points 21.

(6) Armoured Car Wing played 20, won 9, drew 3, lost 8, goals for 31, against 38, points 21.

(7) No. 30 (Bomber) Sqdn. played 20, won 8, drew 1, lost 11, goals for 29, against 57, points 17.

(8) Main Wireless played 20, won 6, drew 1, lost 13, goals for 26, against 75, points 13.

(9) No. 55 (Bomber) Sqdn. played 20, won 3, drew 2, lost 15, goals for 11, against 33, points 8.

(10) Air H.Q. played 20, won 0, drew 4, lost 16, goals for 0, against 21, points 4.

(11) R.A.F. General Hospital played 20, won 0, drew 3, lost 17, goals for 0, against 35, points 3.

THE BELLANCA TANDEM.

The limiting factor in any attempt on the World's Distance or Duration Records is the amount of petrol that can be carried for a given horse power.

With this fact in mind Mr. G. M. Bellanca, of the Bellanca Aircraft Corpn., of Newcastle, Delaware, who is contemplating attacks on the Endurance and Distance Records, has apparently built a fuel tank to carry 2,000 gallons of petrol and then designed around it wings, tail unit and a power-plant that would offer the least drag. The result is known as the Bellanca Tandem.

The petrol tank foundation is lense-shaped in horizontal cross-section with the longest axis placed in the line of flight. The front and rear edges are vertical. A space has been left at the back to accommodate the crew.

Another innovation in the design of the aircraft is the fitting of two engines in tandem back to back at the front of the machine and both beneath the same cowling of N.A.C.A. design. The front engine drives a tractor airscrew direct and the rear engine drives a three-bladed pusher airscrew at the rear of the nacelle by means of an extension shaft. The machine has been designed to have an endurance of about 100 hrs. with a maximum speed of 150 m.p.h., which it is claimed may be increased by detail improvement in design.

Specification.

Type.—Twin-engined sesquiplane with outrigger tail.

Wings.—Upper wing has centre-section extending from the deck of the shortened fuselage or nacelle. To this centre-section outer panels are attached and braced by sloping interplane struts to lower wing. These sloping interplane struts are of the lifting Bellanca type. The lower wing slopes down from the nacelle to the wheels and wing-bracing. Vertical "N" truts brace the extremities of lower wing to ends of upper centre-section. The structure of the wings and lifting struts are similar. Two wooden spars, with wood ribs and fabric covering. Ailerons extend along the trailing edge of the outer panels of top wing.

Fuselage.—This a really very deep nacelle completely filling the gap and terminating in a vertical knife edge behind the wing. The structure consists of 6 tubular longerons with various bulkheads. The whole framework is built of welded chrome-molybdenum steel tubes with fabric covering.

Tail Unit.—Four outriggers carry the tail unit, which consists of a tail plane of high aspect ratio with a fin and rudder placed above the middle of the tail plane. The outriggers, which are of the hollow box type, are so faired that when in flying position a section parallel to the thrust line is a streamline. These outriggers are parallel and wire-braced in plan and in side elevation are Vees with the apices below the tail plane. The feet spring from the upper centre-section and tips of lower wing. Fin is braced to tail plane. Rudder and elevators have horn balances. Structure similar to wings.

Undercarriage.—The wheels are rigidly attached to the extremities of the lower wing and are housed and faired between the wing and the sloping top wing bracing struts. The only shock absorbing is provided by the balloon tyres. Two tail-skids with oleo-shock absorbers are placed at attachment of outriggers to tail plane. Wheel track 17 ft. 10 in. (5.44 m.). Wheel brakes are fitted.

Power Plant.—Two 425 h.p. Pratt and Whitney Wasp radial air-cooled engines mounted back to back at the nose of the nacelle. They are enclosed in one cowling of N.A.C.A. type which has no secondary cowling inside it. Main fuel tank of 1,500 U.S. galls. (1,250 Imp. galls.=5,700 litres) is in front part of nacelle, with tunnel to accommodate extension shaft. Below pilot is auxiliary tank of 230 U.S. galls. (191 Imp. galls.=870 litres) and two wing tanks each of about 260 U.S. galls. (217 Imp. galls.=990 litres). Two 60 U.S. galls. (50 Imp. galls.=228 litres) oil tanks just behind engine. The front airscrew driven direct. Rear airscrew driven by 4 in. dia.×.125 in. thick tube running in self-aligning and lubricated bearings. The entire double engine-mounting is detachable.

Accommodation.—Compartment for two side-by-side in upper part of nacelle aft of wing. Dual control provided by single swing-over wheel hinged to roof of compartment. Two sets of usual type rudder pedals. Engine controls between seats. Two Pioneer Earth-Inductor compasses and special instrument board for blind-flying. Wireless compartment in extreme rear and at bottom of nacelle.

Dimensions.—Span upper 83 ft. 2 in. (25.35 m.), Length 44 ft. 2 in. (13.46 m.), Height 12 ft. 9 in. (3.89 m.), Chord (upper) 9 ft. 6 in. (2.90 m.), Wing area 912 sq. ft. (84.7 sq. m.).

Weights.—Weight empty 7,000 lbs. (3,170 kgs.), Weight loaded 18,000/21,000 lbs. (8,170/9,540 kgs.).

Performance.—No data available.

THE BELLANCA TANDEM.—The latest production of the Bellanca Aircraft Corpn. with two Pratt and Whitney Wasp engines back to back in the nose, one driving a tractor airscrew and the other a pusher by an extension shaft passing through the main fuel tank.

For "Blind Flying"

THE PIONEER TURN AND BANK INDICATOR can be relied upon for "Blind Flying" through darkness and mist. This instrument gives an accurate and instantaneous answer to these questions: "Are my wing tips level? Am I flying straight or turning? Am I banked properly for the turn?"

The Pioneer Turn Indicator is rugged and accurate—it registers definitely even as slow a deviation as one turn in twenty minutes. And this instrument is light in weight and occupies small space—which permits convenient placing on the instrument board.

In addition to the Turn Indicator, we manufacture a complete line of Aircraft Instruments. These are known the world over for quality and dependability, and have played an important part in every famous American flight of recent years.

The Pioneer Instrument Company is always ready to advise you on correct installation, or the proper instruments for the use to which an airplane is to be put.

Pioneer Turn Indicator

Actual Size

Weight complete with Venturi Tube, 1¾ pounds

Depth—face to rear—4¾ inches

THE VISIT TO R.101.

By L. Howard Flanders.

On Oct. 2 the Air Ministry invited the Press to inspect the R.101 and mooring-mast, preparatory to the first tests in the air. Shed tests had already been made, the engines had been run in the shed and the lift and trim verified.

Zero hour for the visit was 11.30 hours, but quite an hour before that time there was great activity in the press room.

The visitors were divided into groups and at the appointed time walked down to the shed and were shown all over the ship by guides, who explained the numerous details.

To refresh the memories of readers the leading details and dimensions are as follows:

The airship is of the rigid type somewhat similar to the *Graf Zeppelin* in appearance. Constructionally it is a great improvement on all previous designs. The great size of the ship enables steel construction to be employed in places.

The frames are structurally stiff and are not braced as is more usual by radial wires, like the spokes of a cycle wheel.

The length of the ship is 732 ft., the height 140 ft., the diameter 132 ft., and the capacity 5,000,000 cub. ft.

This bare statement of facts conveys little or no meaning to the reader, but comparison with the liner *Leviathan* will give some idea of the airship's colossal size.

The displacement of the airship's hull submerged in the sea to a depth corresponding to the draught of the *Leviathan* would be about 100,000 tons. The displacement of the *Leviathan* is 59,957 tons. The beam of the *Leviathan* is 100 ft. and that of the airship is 132 ft. The steamship is longer than the airship.

The horse-power per passenger is also interesting. The *Leviathan* has 34 h.p. for each passenger carried and the airship 55 h.p. per passenger. Had the full complement of 100 passengers, as originally designed, been carried by the airship, it would have had only 29 h.p. per passenger.

The number of passengers carried compared with the number of the crew is 2.5 for the steamship and 1.5 for the airship with its reduced accommodation.

The ratio of the speed is about two to one, consequently the running costs should not compare too unfavourably.

If the airship hull were submerged in the sea as a submarine the tonnage would be about 160,000 tons.

As many people will be familiar with large ocean liners these dimensions will enable them to visualise the airship as much larger than the largest ocean liner. They must not think that this means long promenade decks, for, except that the lounge is of ample size, the accommodation is cramped.

R.101 is designed for low altitude routes at about 2,000 ft., which would prevent its use on the Great Circle Route direct to India. The loss of hydrogen for each 1,000 ft. of altitude is 1/30 the total volume and the loss of hydrogen through leakage is about 100,000 cub. ft. per week. Consequently a climb of 1,000 ft. would cause a loss of hydrogen equal to that lost by leakage in 12 days.

The gross lift of 150 tons is for the climatic conditions of England. In Egypt the lift would be some 10 tons less and at the Equator a further 2 tons lift would be lost by the lower atmospheric density.

The normal crew is 50. This includes two watches of 17, and a third watch to act as a relief to take over when the ship is moored.

At the time of the Press visit the R.101 was inflated and air-borne in the shed. She was anchored down to 8 tons of ballast, and stayed to the top of the shed, to prevent movement. Normally there are 80 or 100 workmen passing in and out of the hull making a variable load of 12 tons which necessitated that the ship should be restrained in both directions as she was ballasted to 2 tons lighter than air.

Starting the inspection of the exterior of the hull, on the extreme point of the nose is the mooring-spindle. Below this is a ring of holes in the fabric which will be open when the airship is under way. These are for ventilation of the hull. The pressure distribution on the hull is such that air admitted at bow and stern will maintain the air pressure inside the outer covering at slightly above atmospheric pressure while the actual pressure along the sides of the hull is below atmospheric pressure. This will cause the fabric to bulge outwards and keep a streamline form.

The air escapes at spring-loaded valves amidships.

Below the ring of valves in the nose is a door which when let down connects with a similar gangway on the mooring-tower.

Three small hatchways below the gangway are for the trailing and handling lines.

There are five power-cars each fitted with a Beardmore-Diesel engine of 585 h.p. They are arranged two forward of the control car, two aft of the control car (but further out from the centre-line) and one aft mounted centrally just forward of the vertical fin.

Of the two front engines the one on the port side is fitted with a reverse pitch propeller for going astern,—so this engine is not only useless for propulsion but is a constant impediment to progress.

R.101.—A bow view of the Government airship in its shed at Cardington. The gangway to the mooring tower, the hatches for the mooring and handling ropes and the two front power-cars may be seen.
(" Aeroplane " photograph.)

Digitized by Google

R.101.—On the left the control cabin and on the right two of the power-cars. —(*"Aeroplane" photograph.*)

The airship was designed to have variable pitch propellers of a highly-complicated design, described on Nov. 8 by Wing Cdr. Cave-Browne-Cave before the Royal Aeronautical Society, and referred to in THE AEROPLANE for Nov. 14, 1928.

These appear to be unsatisfactory as they have not been fitted. Which makes one ask why the engines were not made reversible like ordinary marine Diesel engines, or why the simple variable-pitch reversible propeller exhibited on the stand of the *Associazione Italiana di Aerotechnica* at the Aero Show this year was not fitted? This Italian propeller was tested out about 25 years ago.

The five power cars are similar and were described in the lecture by Wing Cdr. Cave-Browne-Cave.

A small petrol engine of about 30 h.p. in each car starts the large engine through the familiar Bendix gear, as used on motor-cars. Two of the cars have air compressors and the other three cars have electric generators driven by the starting engines or by a constant-speed variable-pitch windmill. The compressed air is used for moving the fuel or water ballast from tank to tank to trim the ship.

The instrument board in the car has the usual instruments,—engine-room telegraph, revolution-indicator, oil-pressure gauge, etc.

A folding ladder gives access to the power cars from the hull.

The Beardmore-Diesel engines are steam-cooled. This method of cooling maintains the water jackets at boiling temperature with a corresponding increase in efficiency, and reduces the size of the radiators to the smallest size possible.

Small triangular condensers are attached to the hull about 20 ft. above the engines for three of the power-cars. Steam from the middle engines is condensed in a retractable radiator which may be used to heat the passenger accommodation.

As this radiator is below the engines the water has to be pumped back to the water-tank. A small electric motor drives a centrifugal pump on the under-side of the radiator.

What happens in a temperature of —50°F.? It appears that this pump is always exposed even when the radiator is drawn up into the hull.

THE CONTROL CABIN.

The only bulky protuberance other than the power-cars is the control cabin. As seen in the shed, there were three wooden transverse beams passing through the lower portion of the cabin. These are for handling the ship on the ground and are not permanent fixtures.

The interior of the car contains a binnacle, with the direction helm in the middle and the altitude control on the starboard side. On the port side are the telegraphs and speaking tubes, between the engine-rooms and control sta-

tion. The top of the control-car is open to the chart-room above.

When in the shed access to the passenger accommodation is through a hatchway, into the crew's quarters. Going up the companion way, on the right and left are a number of two-berth cabins of a somewhat primitive nature.

The berths are of canvas laced to a duralumin framework, with thin mattresses and bed-clothes. The partitions between the cabins are made of aeroplane fabric so thin and slack that if any passenger were to sneeze all the other passengers would feel the draught.

The washing accommodation is probably adequate, but not luxurious. The dining saloon, which is over the galley and smoke-room, has a dumb-waiter or lift from the galley. It is rather small, with long tables.

Further aft is the lounge, a really fine room, with glass windows to give a good view of the earth below.

On the deck below is a small smoking-room with a duralumin floor to act as an ash tray. The galley is well equipped with electric cookers, glass cupboards, and all the necessary equipment of that department. It is worth noting that the ventilation of the galley is arranged with scoops, in the slip-stream of the forward starboard engine to isolate the smell of cooking and prevent the menu from announcing itself automatically an hour or so before dinner.

Further aft is a chart-room of ample dimensions, communicating with the control-cabin below. On the port side of the chart-room are the engine revolution indicators, altimeter and other instruments. On the starboard side is a statascope and the wireless compartment.

The wireless cabin is fully equipped for transmission and reception. A rotary converter generates a 2,000-volt high-tension supply and a rotary interrupter is used for i.c.w. The transmitter may be tuned to any wave-length from 300 metres to 1,600 metres. The usual receiving apparatus is installed with extensions to various parts of the ship.

The electric power distribution board is in the middle of the crew's accommodation.

A gangway runs from end to end of the ship. Transverse gangways at each frame give access to the valves, gas-bags, and the hydroelectric servo-motors for controlling the height and direction rudders.

At the power-cars these transverse gangways give access to hatchways and ladders down to the engines.

The gangway aft to the accommodation is not open for passengers.

The forward gangway is about 3 ft. wide and leads to the entrance gangway to the mooring-tower.

A small ladder to the starboard side of the main gangway leads up to the mooring cabin.

In the mooring cabin may be seen the end of the mooring-spindle, which is stayed to a ring with tension spokes like a bicycle wheel. This ring is attached to the frames and takes all lateral loads on the spindle. Here may be seen the connections for fuel, water, and electric supply at the mast and for the telephone to the ground. A winch carries the mooring cable.

The normal fuel, a heavy oil with a high flash-point of 200° F., a low viscosity and costing only £5 per ton, is carried in cylindrical tanks distributed in various parts of the ship. This may be blown from tank to tank by compressed air to trim the ship. The water-ballast is carried in similar tanks and may be blown from tank to tank for trimming purposes like the fuel.

The normal fuel capacity is 29 tons, the maximum possible is 44 tons. Eight tons of water are carried in emergency bags, which may be emptied rapidly. And 7 tons are in tanks for trimming purposes.

The only petrol carried is in small tanks in the power-cars. These tanks may be jettisoned in case of danger of fire. Some of the heavy-oil fuel-tanks have facilities for jettisoning the fuel to get a rapid lift in emergency.

The officers of the ship are the skipper, navigator, and first and second officers. The watch is composed of engineers and riggers, direction and height coxswains.

When starting a flight or returning to the tower two engineers are required for each engine, and there are the various winches to be manned. Consequently one presumes that both watches are turned out.

It must not be forgotten that all controls must be manned while the ship is at the control-tower. Their duties, in addition to any minor repairs, cleaning and overhaul, are maintaining the static trim, manning the altitude rudder, and in bad weather keeping the engines warmed up and ready to start.

The whole construction and organisation appears very complete and inspires confidence.

The Mooring Tower.

The mooring tower is about three-quarters of a mile from the airship sheds.

A circle of anchor-blocks is set in concrete at a radius of 750 ft. from the town. The use of these will be described later.

At the base of the tower is the engine-room, which houses three steam winches, an electric generator and pumps for fuel and water. Large underground tanks contain fuel-oil and petrol.

A pipe-line is laid from the hydrogen gasometers about a mile distant from the tower.

The tower is ascended by an electric lift which, strange to say, has frosted-glass windows. Is this to prevent passengers from feeling nervous as they see the view extending over the country as they mount the 170 ft. to the gallery? The view of the level plain with a ring of distant hills which is seen from this gallery is quite interesting.

A small trolley with steps and a wind-rail runs round this gallery on rails. This trolley couples up with the entrance gangway to the airship and follows all its movements as the ship swings to the wind round the tower.

Connections for water, fuel, and gaspipes may be seen here as well as plugs for electric power and telephone.

A ladder from this platform leads up to the mooring-tackle and locking apparatus.

The controllers, which are somewhat similar to a tram controller, are situated on the gallery in positions which give a full view of operations.

Seven examples of this type of tower, originated by the Air Ministry, have been set up in the U.S.A. and have been found satisfactory.

The early type of mooring-tower was arranged to pull the airship by one cable up to the mooring spindle in a hori-

R.101.—Some of the crew and designers of R.101. From left to right: Flg. Off. M. H. Steff, Lieut.-Cdr. N. G. Atherstone, Flt. Lt. H. C. Irwin, Lieut.-Col. V. C. Richmond (Chief Designer), Major G. H. Scott (Captain), Mr. T. S. D. Collins, Mr. M. B. Fitzgerald, Flt. Lt. S. Nixon and Cdr. W. H. Watt.

zontal direction. This was found to cause considerable instability

In the present system the airship drops the mooring cable and two handling lines from an altitude of about 1,000 ft. The handling lines are fed through the anchor blocks at about 60° on each side of the direction of the wind. The mooring cable of the ship is then connected to the mooring cable of the tower and the airship is hauled down to the mooring tower by three lines. This is found to give a steady mooring.

The two gangways are then coupled up for passengers, the pipe-lines are connected and the cables plugged in.

Two water-ballasted rollers are connected to the stern of the ship to hold her on an even keel under minor aerodynamic and temperature changes.

The relief watch then go on board and take charge.

The duties of the relief watch, in addition to overhaul, are to man the controls.

When a gale warning is received the engines are started and warmed up ready to leave the tower if the gale becomes violent.

A parallel to this is found in harbours in the South Seas, where a hurricane warning is the signal for all ships to leave harbour to ride the hurricane out in open water. Some years ago a steamship neglected this warning in Suva harbour. She put down extra anchors and steamed full speed ahead to relieve the tension on the cables. When the hurricane blew out she was found half a mile inland.

WHEN ONE MEETS AN AIRSHIP.

Air Ministry Notice No. 60 of the year 1929 emphasises the rules which must be observed when encountering airships, which are as follows:—

Subject to the provision that an aircraft about to land on an aerodrome be given free way, flying machines shall always give way to balloons, fixed or free, and to airships, and airships shall always give way to balloons, whether fixed or free.

An airship, when not under its own control, shall be classed as a free balloon.

The marine-minded may be tempted to inquire how long an airship can behave as a free balloon before being regarded as flotsam.

In view of the happenings at Cardington, and the general burst of airship activity, pilots are requested by Air Ministry Notice No. 62 not to fly within a three-mile radius of the Mooring Mast at Cardington.

WHY AND WHEREFORE?

[*The World, The Air and The Future.* Commander Sir Charles Dennistoun Burney, Bart., C.M.G., R.N. (Ret.). xxiii+343 pp. 31 illustrations. 2 maps. Index. Alfred A. Knopf. 21s. (Also obtainable from The Aeroplane Book Department, 27 Pilgrim Street, E.C.4.)]

Sir Charles Burney has written a book which his publishers tell us is "a brilliant survey of the problems of aviation and its rapidly increasing influence on the modern world," and they, with commendable modesty, have likened the writer to Admiral Mahan, the distinguished author of *The Influence of Sea-power on History.*

The first four chapters are devoted to preaching the necessity for developing Imperial Air Routes and these contain much of interest, although we feel that they could with advantage have been shorter.

Sir Charles Burney rightly points out that the problem of future development of the British Empire mainly resolves itself into improved collaboration between the Mother Country and all the units of the British Commonwealth of Nations, and that the future system of transport lies very largely in the air, for there is doubt whether or not the speed of trans-Oceanic steamers is ever likely to be increased beyond its present limits.

Sir Charles Burney is here preaching to the converted (for he will find, like many other authors, that few of the unconverted buy books of this character) and we feel that he would have been wiser had he appreciated the central fact that it is not the necessity of Empire Air Routes that is in question, but rather whether or not Sir Charles has, as a result of his efforts of the last seven years, provided a useful contribution to this problem of development, and we will therefore turn to the pages in which he gives an account of his work in connection with rigid airships.

We may remember that in 1919 *R*.34 made a successful return voyage across the Atlantic, and that after this the suggestion was made that this airship should make a trip to Egypt and to India, with the object of testing the value of airship transport in tropical countries. Largely through the inanition of the Airship Service, this voyage was never made.

In 1920 this country experienced the first part of the trade depression, and the Government of the day was forced to economise in all directions, and to this end gave instructions that the Airship Service was to be closed down and all the ships and stations to be sold. The next problem was to find a purchaser. Shortly afterwards, the United States' Government offered to buy *R*.38—a proposal to which the British Government agreed—a step which, of necessity, prohibited the closing down of the Airship Service, as this airship was not yet completed.

In the spring of 1921 the official statement was made that, unless the other airships were sold by private treaty, then perforce they would have to be handed over to the Disposals Board, where they would probably have been sold as scrap. Several proposals were received from would-be purchasers, but the first practical schemes emanated from Mr. A. H. Ashbolt (The Agent-General for Tasmania), Mr. M. M. Greenhill and Lieutenant-Commander W. B. Ballantyne. The first two suggested the formation of a private company for the running of an airship service to India, Australia and South Africa, but in the end their proposal was rejected by the Government because it felt that a State subsidy was not justified, and moreover, the existing airships were not suitable for commercial service. A similar fate befell the scheme of Lieutenant-Commander Ballantyne.

Shortly afterwards *R*.38 came to disaster and the wave of reaction nearly destroyed the chances of building up any future airship service.

Early in 1922, however, Commander Burney (who represented a syndicate in which Vickers Ltd. and the Shell Oil Group were mainly interested) approached the Government with the idea of forming a large company with the object of running a bi-weekly service to India with an extension to Australia. He required a subsidy from the State of such a size that the Cabinet were unable to agree to his proposals.

Nothing daunted—and here we must pay a tribute to Sir Charles Burney's pertinacity, for, had he not persevered, there is some doubt whether or not *R*.100 and *R*.101 would be in existence to-day—he proceeded with alternative schemes, until finally the previous Labour Government agreed that two airships should be built, one by the State and one by The Airship Guarantee Company (of which Sir Charles Burney is really the prime mover), which receives contributions from the State.

Since that date Sir Charles Burney has preached the gospel of the airship, both in this country and abroad—and here we may remark in parenthesis that he would have been wiser if, while writing this book, he had refreshed his memory with some of his earlier statements, particularly his enthusiastic public speeches of the period 1923-25.

Since the initiation of this programme few activities of the State have been so hotly criticised as the building of these airships, and as the mouths of those who are responsible for *R*.101 are sealed, we had hoped to find a reasoned reply from Sir Charles Burney to all these criticisms, but we are disappointed. He knew perfectly well when his airship was laid down that she was to be moored to a mast—this was the central point in the ground organisation—and yet we now find pages of his book devoted to a deprecation of this method of mooring and, *mirabile dictu*, he enlists his support from the writings of Mr. Spanner!

Sir Charles now says there is no hope for the future of airships unless they can moor to a buoy, like a ship—a by no means novel idea, for the first Zeppelin airship and the *Mayfly* were designed to be able to alight on water and to be moored thereon—we wonder if he has considered the effect of the tideway on a huge airship. He holds there is no future for the tall mooring mast and only wishes that he had been allowed to moor his airships to a floating ship, and supports his contention by quoting the successful experiments conducted in the States with the *Patoka*, but he must full well know that the *Los Angeles* was a great deal smaller than the *R*.100. We are in agreement with him when he says that the day has passed for the modern rigid airship to be man-handled, but we have grave doubts as to the economic possibility of his mooring and docking raft. He also gives a description of a new elliptical airship and a new system of propulsion, all before he has gained experience with *R*.100.

This brings us to our main criticism of the book—why has he written it? He tells us that *R* 100 is only an experimental ship, and that she must only be regarded as such and "has served her purpose admirably: and in view of what the 'experiment' has taught us, and of the new developments it has rendered possible, I claim that the time, money, and effort expended on it have been more than justified. And this is my answer to my critics."

We doubt whether they will be satisfied. Again, after the work of seven years he feels that *R* 100 will not be of much use commercially "until she has undergone the necessary alterations to enable her to use the mooring and docking raft."

We repeat, why has he written this book? Is he trying to save his face? Is it a mere "puff"? Or is it a genuine conviction? If the latter is the correct supposition, why did he carry on with the construction of the airship—or has it taken him all these years to "face facts"?

We have devoted much space to reviewing this book, but before we close we note with dismay that he has once more raised the question of the desirability of fusing the Royal Air Force into the Royal Navy. He is perfectly entitled to his own opinions, but we feel it is an error of judgment to express them in print, especially, had it not been for the help the Air Ministry gave him—as he is compelled to admit—his airship could not have been built. The knowledge is common in Service and Press circles that in the early days he did his best to play off the Admiralty against the Air Ministry, and now he would seem to be biting the hand that fed him—the hand which supplied him with his ground organisation and much technical advice.

In short, we feel that it was a mistake on his part to publish this book at the present time and a mistake not wholly free from ingratitude. Let us rather see what these two airships can do and then write about them if we wish. He ends his book in the hope "that the advent of the air age will see the inauguration of a bold and comprehensive policy of Empire development worthy of the glorious traditions of our race"—a noble ideal, but we beg leave to doubt whether this book will bring it much nearer to fruition.—S.

THE GUILD OF AIR PILOTS AND AIR NAVIGATORS OF THE BRITISH EMPIRE.

The first General Meeting of the Guild of Air Pilots and Air Navigators is to be held at the Hotel Cecil (Indian Suite) at 6.45 p.m. on Saturday, Oct. 19.

This meeting is to be followed by an Inaugural Dinner at 20.00 hrs., and as accommodation is limited all members should make early application for dinner tickets to the "Clerk to the Guild," Mr. L. A. Wingfield, 61, Cheapside, E.C.2.

Members may bring lady guests. The price of the tickets is 12s. 6d. each exclusive of wines.

Lady Cobham has kindly consented to act as hostess on this occasion.

ORDER THE SPECIAL AIR-PARK ISSUE IN GOOD TIME.

ACCESSORIES for AIRCRAFT.

Enquiries of Aircraft Constructors and Users are invited for the following specialities manufactured by VICKERS (AVIATION) LIMITED and used largely in aircraft supplied to the Royal Air Force:—

VICKERS (Patent) FUEL COCKS (Light Pattern).

VICKERS FUEL PUMPS (Hand-operated & Wind-driven).

FOOT VALVES. NON-RETURN VALVES. FUEL FILTERS.

RELIEF VALVES. FLOW INDICATORS. OIL COCKS.

VICKERS-DAVIS NAVIGATION LAMPS (Light Pattern).

GENERATING EQUIPMENT FOR AIRCRAFT LIGHTING.

VICKERS-REID CONTROL INDICATOR.

VICKERS-POTTS OIL COOLERS.

VICKERS OLEO-PNEUMATIC UNDERCARRIAGE AND TAIL SKID SHOCK ABSORBING UNITS.

VICKERS UNIVERSAL PULLEYS & GUARDS FOR LIGHT CONTROLS.

STREAMLINE WIRES AND SWAGED TIERODS.

"MALLEVILLE" ADJUSTABLE PIPE CLIPS.

VICKERS (Patent) HYDRAULIC BRAKES.

THE LIGHT AEROPLANE AND THE FLYING CLUBS.

MOTHS FOR FRANCE.

The De Havilland Aircraft Co. Ltd. has received official notification to the effect that the British Certificate of Airworthiness for the Moth will henceforth be accepted by the French Air Ministry.

This means that a Frenchman, if he desires to buy a foreign light aeroplane, may buy a D.H. Moth, with the added comfort that he may register the machine in France. The French authorities will only require to see the British Certificate of Airworthiness, after which the machine will be "immatriculated" with the French registration lettering and "The Moth" will become "Le Moth." This procedure applies only to private owners.

Hitherto French private-owners when buying British aircraft have had to register in England in the name of a British friend or sympathiser, and considerable trouble has arisen in the past not only with regard to Airworthiness Certificates, but also in connection with the issue of carnets or tryptiques for foreign travel by the official governing body of the nationality of the pilot or owner for a machine registered in a neighbouring country. At present there are six French private owners of Moths.

GALE FIGHTING.

On Sunday, Oct. 6, while the Dungeness Lifeboat was rescuing people from a shipwreck in the Channel, and the wind was registering 37-43 miles p.h. at Lympne, Mr. Story took off for Brussels in a Moth with Mr. H. E. Twaites, Hon. Treasurer of the Cinque Ports Club. They left at 12.53 hours and were not reported at Calais until 13.43 hours, during which time they must have had a very unpleasant crossing over a terrific sea. They finally landed safely at Brussels at 15.08 hours.

Mr. Story was the first pupil trained *ab initio* by this Club and has just over 100 hours' flying experience. He has previously put up some fine flights in bad weather, notably when he won the Rally at Conington early last year, and his recent flight from Lympne to Ireland. This last performance, however, was a very fine show and should be convincing proof of the safety and utility of light aircraft as a means of transport. Mr. Story and Mr. Twaites propose to tour the Continent for a week.

THE LONDON AEROPLANE CLUB.

The Flying Time of the London Aeroplane Club for September was:—Dual instruction (272 flights), 130 hrs. 55 mins. Solos (220 flights), 91 hrs. 55 mins. Passengers (76 flights), 29 hrs. 10 mins. Tests (103 flights), 17 hrs. 50 mins. Total (671 flights), 269 hrs. 50 mins.

The Pilot Instructors were Major H. C. Travers and Mr. F. R. Matthews, the Ground Engineers were Messrs. C. Humphries and A. E. Mitchell, and the aircraft in use were G-AABL, G-AABN, G-EBXS, G-EBZC, G-AAEX, and G-EBWY.

During the month the following members qualified for their "A" Licences:—Miss F. Surtees, M. Armstrong, B. W. Houlding, R. D. Berrington, H. V. Williams, H. T. Monyneux, M. L. McCulloch.

THE HAMPSHIRE AEROPLANE CLUB.

The total flying time for September was 214 hrs. 50 mins., of which 93 hrs. 30 mins. was dual instruction, 30 hrs. 30 mins. was solo flying, 81 hrs. 40 mins. was flying by "A" pilots and 9 hrs. 10 mins. was test and other flying.

Four machines were in commission. These were D.H. Moth G-EBOH, Avro Avian G-EBVI, D.H. Gipsy-Moth G-AAJR, and Simmonds Spartan G-AAFR.

During the month 11 new pilot members and one associate member joined the Club. Messrs. Kingston, Pleydell-Bouverie, Winn and Stisted qualified for their "A" licences.

The flying time for the month is the best this year, in spite of the fact that Mr. Dudley was the sole instructor.

On Sunday, Sept. 8, a record day's flying was achieved, namely, 23 hours.

The total flying put in by the Club machines for the nine months ended Sept. 30 exceeds 1,341 hours, which is 37 hours more than for the corresponding period last year.

THE MIDLAND AERO CLUB.

The following is the Midland Aero Club's report for the month of September, 1929:—

Instructors: Messrs. W. H. Sutcliffe and T. W. J. Nash, A.F.M. Engineer: W. J. Halland. Asst. Engineer: G. Rees. Aircraft: Two (XT, DB).

The total flying time was 141 hrs. 11 mins., 421 flights. Dual, 77 hrs. 35 mins.; Solo, 45 hrs. 45 mins.; Passenger, 13 hrs. 35 mins.; Test, 4 hrs. 15 mins.

Messrs. P. Stone, H. A. Taylor, B. P. A. Vallance and Mrs. R. Vereker passed the tests for their "A" licences.

On Sept. 30 EBLT and EBLW were flown back to Castle Bromwich on completion of their fourth annual overhaul for renewal of C. of A.

THE NORFOLK AND NORWICH AERO CLUB.

The total flying time of the Norfolk and Norwich Aero Club for September was 108.45 hours, of which 52.15 were dual instruction and 49.25 to solo flying. The remaining 7.5 hours were tests and passenger flights.

Three pupils did their "A" Licence tests during the month and several more are just on the brink of their first solos.

On the whole the month has been a success and fourteen new members, six of whom active, have been enrolled. There is no scarcity of pupils. The booking sheets are full from day to day which only proves that flying is becoming more and more popular.

A ROYAL MOTH.—The Gipsy-Moth which has been supplied by the De Havilland Aircraft Co. Ltd. to be used by H.R.H. the Prince of Wales. It is painted red and blue,—the colours of the Household Brigade Flying Club. —(*"Aeroplane" photograph.*)

Digitized by Google

At the moment we have two New Zealanders flying with us. One is a member of the Auckland Aero Club and the other a member of the New Plymouth Club. Both arrived within a day of each other. One is an old Norwich man and the other claims Norwich as the home of his antecedents.

We have advertised the fact that accommodation can be provided on the aerodrome if desired by anyone taking an intensive course of instruction. Within a fortnight of that advertisement's first appearance Mr. C. Parkerson, of New Zealand, availed himself of this accommodation.

The second of a very interesting series of flying, bombing, and landing competitions took place during the month and entries enough to keep going until dusk were forthcoming. The rules are very simple but they work extremely well and these competitions do tend to improve form.

Points were given for take off, approach, and landing. Possible points obtainable were take-off 20, approach 40, landing 40, total 100.

In the first competition it was noticed that a great many competitors lost points on their take-off and as the results were posted on the notice board they doubtlessly considered this carefully, and last time scarcely any points were lost on that score. The first prize for this competition was the Alexander Duckham Silver Challenge Tankard. This was won for the first time by W. J. Pickthorn. One of these competitions will be held every month in future.

We have been developing a photographic department in the Club during the last month and it is meeting with much success. For some time the Club has had possession of a very fine aerial camera and now an exceptionally good dark room has been fitted up with enlarger and all necessary plant. Inquiries for photographs are welcomed.

Three more members of the Club have become private owners during this month. All bought Avians. Now we have seven private owners, which is quite a respectable number for a provincial Club at this stage.

The second Annual Ball will be held in St. Andrew's Hall, Norwich, on Nov. 26, and a very large gathering is expected. Anyone wishing to attend should make very early application for tickets, for last year a crowd of people were disappointed when a fortnight before the date of the ball all tickets had been sold. St. Andrew's Hall is a fine old building and will accommodate a much larger crowd than the hall we had last year, but the demand for tickets is just as large as before.

The following have honoured us by becoming Vice-Presidents of the Club. The Rt. Hon. The Viscount Elmley, Bt., M.P., The Rt. Hon. Sir Samuel Hoare, Sir J. Field Beale, J. A. Christie, M.P., J. Cator, M.P., P. E. T. Carill Worsley, and James Hardy.

THE SCOTTISH FLYING CLUB.

The Scottish Flying Club flew 145 hours 30 minutes during the month of September. Of this time 74 hours 55 minutes was taken up by dual instruction, which constitutes a record for the Club. Although only one licence was actually awarded—to Miss E. A. R. Anderson—seven other members completed the tests for the "A" ticket during the month. Miss Anderson was the candidate chosen by the Club to benefit under the Scholarship Scheme of the Air League and is the second woman in Scotland to be awarded a pilot's licence. A noteworthy performance was put up by Mr. A. F. Wallace, who, on his first solo on Sept. 17, did 50 minutes in the air and then proceeded to do the height test, etc., for his licence on the same morning.

With the approach of Winter activity is now being transferred to indoors, and the Badminton Section, which proved so popular last season, has held its first meeting. As before, meetings will be held on Tuesdays and Thursdays of each week throughout the season at 19.30 hrs.

The first of the Club dances is to be held on Friday, Oct. 25, at the Piccadilly Club, 92 Sauchiehall Street, Glasgow. A large attendance is expected, and all interested in the movement are cordially invited. Tickets, price 5s., may be had at the aerodrome, or from Mr. H. W. Smith, 101, St. Vincent Street, Glasgow.

THE PHILLIPS AND POWIS SCHOOL.

The Report of the Phillips and Powis School of Flying, Reading, for the month ending Sept. 25, is as follows:—

Flying Time: 112 hrs. 15 mins.; Instructor: W. Giddy.

Notes: The following new pupils have joined the School—Mrs. Lavington, Mrs. Davies, Dr. Nicholson, Dr. Penny, Dr. Hoole, and Messrs. Crawshaw, Hayne, Pook, Frost, Goodbody, Owen, Chaning Pearce, Aitchison, Piper, Hull, Saunders, Turner, Rendle, Brighty, Newman, Coggin, Walton, Kemp, Peach, Cownie and Browne.

Messrs. Skuce, de Fraine and Milne passed their test for "A" licence.

The School has acquired another Moth, G-EBVC, to help with the increasing number of pupils.

A BELGIAN LIGHT AEROPLANE MEETING.

Between Sept. 25 and Sept. 28 there was held at the Evère aerodrome, Brussels, the 7th annual *Concours International d'Avions Légers et de Tourisme* for the *Coupé Challenge du Roi*, presented by H.M. the King of the Belgians.

Eleven entrants were due to arrive at the aerodrome before midday on Sept. 25. Two of the original entrants, one a Caudron and the other an Avro Avian, did not arrive.

Mr. Hubert Broad arrived at 16.00 hrs., four hours late, and the stewards put it to the other competitors to decide if he should be allowed to compete. The result of a secret ballot was negative. A Pander, flown by M. Lammertz, was disqualified for being overweight.

This left the following machines in the contest: Klemm (40 h.p. Salmson), Herr Lusser; Caudron 161 (65 h.p. Salmson), M. Delmotte; Orta-St. Hubert (85 h.p. Walter), M. Maus; Potez 36 (95 h.p. Salmson), M. Bayol; Potez 36 (60 h.p. Salmson), M. Weiss; Potez 36 (70 h.p. Renault), M. Lemoine; and Avro Avian (115 h.p. Cirrus-Hermes), E. W. Percival.

The afternoon of Sept. 25 was given over to weighing the machines and pilots and allotting the ballast to be carried. All aircraft were divided into the same two categories, as used in the *Challenge de Tourisme*, and, as in that contest, all aircraft were allowed a 10 per cent. tolerance.

Only one machine came under the lighter category, and this machine, the Klemm-Salmson, flown by Herr Lusser, was allowed a maximum weight of 308 kgs. (678 lbs.), and had to carry a load of 160 kgs. (352 lbs.).

In the other category the maximum weight allowed was 440 kgs. (968 lbs.), of which 200 kgs. (440 lbs.) had to be load carried.

All entrants had to submit their licences together with the C. of A.'s of their aircraft for examination by the *Aéro Club de Belgique* and at the same time they had to supply the price of their aircraft, as delivered in Belgium, in Belgian francs, for single examples, and for a series of six. The lowest prices was credited with 40 points.

In all tests it was possible for competitors to amass a total of 320 points. These were allotted as follows: 50 for Taking-off, 90 for Landing, 30 for Maximum speed, 20 for Minimum speed, 30 for Fuel consumption, 20 for Climb, 20 for Dismantling, 20 for Qualities, and last the 40 for Price.

The tests on Sept. 26 were to decide the various "qualities" of the machines. Out of the total of 20 points obtainable, 6 were given for robustness of construction, comfort of crew, installation of equipment, and provision of undercarriage without cross-axle and fitted with brakes; 3 for engine-starter, 3 for dual control, 2 for parachutes, and 6 for anti-fire equipment.

Thereafter the machines took off on a consumption test over a distance of 400 kms. The Potez 36 (60 h.p. Salmson engine) flown by M. Weiss, was forced to land, but all other machines completed the test satisfactorily, although for some reason known to itself the *Aéro Club de Belgique* refused to release any figures obtained.

On the following day the six remaining entrants had to do a height test, a maximum and a minimum speed test. In the last-mentioned M. Bayol, on the Potez 36 broke his airscrew and damaged his undercarriage when landing.

On Sept. 28 the remaining tests were completed. These were the Getting-off test, the Landing test, and the Dismantling test. On this day, although he was not doing any particular test at the time, M. Maus, on the Orta-St. Hubert, damaged his undercarriage and was disqualified.

The result of the Contest was that Lusser, in the Klemm-Salmson, with a total of 273 points won the *Coupe Challenge du Roi*, as collector of the greatest number of points, the *Coupe Challenge des Avionettes*, as winner of the 1st, or light, category, and a prize of 15,000 francs.

M. Delmotte in the Caudron-Salmson with 229 points was first in the 2nd category, and was awarded the *Coupe Challenge D.G. Nicolaïdes* and a money prize of 5,000 francs.

Of the remaining two finishers M. Lemoine on the Potez-Renault was third with 185 points and Mr. E. W. Percival on the Hermes-Avian fourth with 151 points.

THE BRISTOL ACCIDENT.

The inquest upon the bodies of Edward Matthias Tiarks and 2nd Lt. Edward Victor Somerset was concluded at Staple Hill (Somerset) on Oct. 4. The jury returned a verdict of death due to the accidental crashing of an aeroplane.

The cause of the accident is a complete mystery and no evidence is available to show why the machine crashed. Subsequent examination of the wreckage failed to show any defect which might have caused the disaster and both the victims were experienced pilots and in excellent state of health, thus precluding the likelihood of one fainting and jamming the controls.

ESAVIAN

FOLDING & SLIDING DOORS FOR AEROPLANE HANGARS

Esavian Doors, 32 ft. high and 70 ft. long, fitted at Henlow Aerodrome.

The Unique Principle

The Esavian Folding and Sliding Doors are hinged to Sliding Uprights (patented). These uprights slide with the greatest ease, being fitted with purpose made Ball-Bearing Runners which carry the weight of doors of any height. Esavian Doors over 20 feet high can be fitted with Winding Gear (patented) so that they can be opened by one man.

The Test

Esavian Fittings have been supplied to the Government for Doors to cover Ten miles of openings. These openings vary in height up to 32 feet and in length to 100 feet. Esavian Doors were fitted to the Hangar at Calshot which housed the Schneider Cup Aeroplanes, to the Hangar at Heston Aerodrome, 19 feet in height and 100 feet in length, and are also being supplied to Hanworth Park.

PAMPHLETS AND DETAIL PRINTS GLADLY SUPPLIED ON APPLICATION.

Your own aeroplane

Why you should buy your machine through N.F.S.—

1. Because N.F.S. have a thoroughly experienced technical staff who will advise you, without prejudice, as to the best machine for your particular purpose.

2. Because the N.F.S. "engine service" scheme will permit you to exchange your engine for a similar one, and save the delay of overhaul.

3. Because no other organisation is in a position to give you the same service as N.F.S. can do through their chain of provincial aerodromes and landing grounds. If you are flying abroad, N.F.S. spare no pains to fulfil your requirements quickly, efficiently, and at a minimum cost.

4. Because, through N.F.S. you can arrange your requirements as regards insurance, hire purchase, maintenance, and overhauls, with the minimum of expense, and in the quickest possible time.

5. Because N.F.S. will give you the best price for your second-hand aeroplane in part exchange for a new machine, or sell your used machine on a commission basis.

6. Because N.F.S. can supply you from stock with all spare parts for the most popular types of light aircraft.

7. Because N.F.S. are the largest aeroplane sales distributing organisation in the country, and can, therefore, give you the most comprehensive service.

USED AIRCRAFT.

Second-hand machines at prices ranging from £120 to £750 are now available. Demonstrations at Hanworth and elsewhere. Please write for list.

COMMERCIAL AERONAUTICS.

SIR ALAN COBHAM'S CAMPAIGN.

A certain natural sequence may be observed in the development of any form of transport. First the vehicle itself is produced and then must come a pause while the routes used by the vehicle are developed.

The sequence can be easily observed in the development of road transport, the use of canal barges, railways, and even ships. After all, the growth of shipping was entirely dependent on adequate docking arrangements.

Civil Aviation has reached the stage now where one can say that aviation is waiting on ground organisation. The best passenger-carrying machine is useless without suitable landing grounds. In this country to-day we have facilities for producing aircraft and we have the engines, but there is insufficient ground organisation.

The people who must provide and maintain flying grounds are the people who will ultimately benefit, that is, the Towns-people. Their representative executives are the Mayors and Municipalities and their officers.

Thus one sees how soundly Sir Alan Cobham is laying the foundations of a great Industry by his recent flying campaign all over the country.

Something like 100 towns have been visited and their local notabilities have been taken for trips over their own homes. The results of the campaign will obviously take some time to mature, but at least 20 towns are likely to acquire aerodromes in the not so far future.

During the 21 weeks which the tour has lasted, the *Youth of Britain*, as Sir Alan's Giant-Moth is called, is claimed to have flown something like 60,000 miles and to have taken up 40,000 passengers during 760 hours' flying time.

On Oct. 7, a demonstration was arranged at Stag Lane Aerodrome, on the occasion of Sir Alan Cobham's return. *The Youth of Britain*, which had been circling round, landed precisely at 11.30 hrs. As the Giant Moth taxied up to the crowd there was a surge of photographers to get pictures of the machine, which looked a trifle travel-stained but in excellent condition after her long journeyings.

The Director of Civil Aviation, Sir Sefton Brancker, Mr. Frederick Montague (Under-Secretary of State for Air), Sir Charles Wakefield (whose generosity made the free trips possible for so many hundreds of school children), and Sir Edmund Phipps, Deputy Secretary of the Board of Education, and Mr. Harold Perrin, Secretary of the Royal Aero Club, were there to welcome the return of the Apostle of Aviation.

Sir Charles Wakefield, Mr. Montague and Sir Alan then

THE BRITISH AIR-PARK CAMPAIGN.—The itinerary of Sir Alan Cobham's remarkable tour, which ended last Monday, in which he visited nearly 100 cities and towns, to discuss with the local authorities the organisation of municipal aerodromes.

Digitized by Google

"NEXT PLEASE."—Sir Alan Cobham in the Giant Moth at Stag Lane. In the foreground, are Lady Cobham and her two children, with Sir Charles Wakefield and a string of youngsters waiting their turns for a trip.

made short speeches in front of the microphone. These speeches laid stress on the number of people who had been introduced to Aviation and the reliability of the aircraft and engines.

The point that impressed the writer most was Sir Alan's statement that 40,000 people have been in and out of the machine since the start of the Tour. That alone is a remarkable tribute to the machine, for 40,000 people do a good deal of scrambling about.

While the photographs and speeches were being made, the crew had cleared out all the miscellaneous baggage and spares and were putting in the seats. When this had been done Sir Sefton Brancker, Mr. and Mrs. Montague, Sir Edward Phipps and Sir Charles Wakefield were taken up for a fly-round. And then there was an adjournment for refreshment and general conversation.

A large number of school-boys and girls formed part of the crowd. During the interval parties of them were picnicing round the machine. These children were taken for trips in the afternoon.

Quite apart from the value of the campaign as propaganda it is value as illustrating the work of the equipment. The D.H. Giant Moth and Armstrong Siddeley geared Jaguar have done their jobs efficiently and without any complaint. The engine has done 50,000 miles without a complete overhaul. The machine has been out in the open practically all the time (with a night-watchman sleeping on board), so that the Tour in itself is further and valuable evidence of the reliability and robustness of aircraft and engine.

Much of what Sir Alan has learned during his tour is embodied in the article which he has written for the Air-Park issue of The Aeroplane, which will appear on Oct. 23.

THE EAST AFRICAN VENTURE.

Sq. Ldr. the Rt. Hon. F. E. Guest, C.B.E., D.S.O., accompanied by Miss W. E. Spooner, Flt. Lt. R. C. Preston, A.F.C. (R.A.F. Special Reserve), and Mr. E. G. Hordern, R.A.F., sailed from Marseilles in s.s. *Madura* for East Africa on Oct. 5. The three D.H. Moths which they are taking with them were shipped in the *Madura* in London and will be assembled at Nairobi, which will be the headquarters of the expedition.

During the absence of Flt. Lt. Preston, Flt. Lt. Briggs, R.A.F.O., will act as Secretary of the Belfast Flying Club.

Mr. E. G. Hordern has been granted leave of absence from the R.A.F. until the end of the expedition in January, 1930.

Sq. Ldr. Guest's expedition has been organised to investigate the possibilities of commercial aviation in East Africa and although they will operate air-taxi services at the beginning the main idea is to make a survey of the country with a view to opening commercial air lines.

THE RESPONSIBLE PARTIES.—Left to right: Mr. Frederick Montague (Under-Secretary for Air), Sir Charles Wakefield (the Patron Saint of British Aviation), Sir Alan Cobham (his apostle), Sir Sefton Brancker (Director of Civil Aviation), and Sir Edward Phipps (Deputy Secretary of the Board of Education).

NORTHERN AIR LINES.

Northern Air Lines began operations at their Manchester Branch on April 11, 1929. From that date until Sept. 30 their aeroplanes have flown a total of seventy-eight thousand one hundred and sixty-five (78,165) miles. No passenger or employee has been injured. Over ninety-nine per cent. of the scheduled journeys reached their destination.

The Company has a total of ten aircraft, but only seven machines have actually been in use at one time during this period. The remaining three have been reserved to replace those undergoing overhaul.

This mileage has been put up on three classes of work, Air Taxi work, that is the hiring of a private aeroplane with pilot to take people to various destinations, Joy-Riding (pleasure flights for the public at 5s. per flight), and Instruction—tuition or teaching people to fly and also the hiring of aeroplanes to private pilots.

The total time flown in the five months amounts to 1,116 hrs. in the air.

24,280 passengers have been carried, and, as we said before, without injury.

The Company announce a reduction of 33⅓% in their charges, and tney are now doing Air Taxi work at 10d. per mile.

Five pilots are permanently employed and two other pilots are engaged temporarily. A number of the people who have been taught to fly now hire aeroplanes and go away for week-ends, etc.

An increasing business in overhauls and repair work is being built up.

AVRO FIVES AND TENS.

A. V. Roe and Co. Ltd. has sold several machines of the Avro Five four-passenger monoplane type (three Genet-Major engines) which was exhibited at the Aero Show at Olympia. One has been sold to Wilson Air Lines, of Nairobi, Kenya Colony, and another has been acquired by an air transport company in Queensland, Australia. Two more have been ordered by an unnamed firm for air survey work in the Sudan.

The Avro Ten, which is the British version of the Fokker F.VII-3m, has also attracted considerable attention. Four of this type have been sold to Australian National Airways Ltd., which company intends to operate a service between Brisbane and Sydney. Mr. Kingsford Smith, who is one of the directors of this company, has flown one of the type and has expressed himself highly satisfied with the performance and construction of these machines. Another Avro Ten has been bought by an air transport company in Queensland.

FREIGHT FOR THE DUTCH EAST INDIES.

The K.L.M. (Royal Air Traffic Company), of Holland, now offer facilities to business firms for sending air freight goods to the Dutch East Indies. The freight rate will be £2 10s. a kilogramme (2 lbs.), with a minimum consignment of one kilogramme.

Air mail will still have a preference, however, and merchandise can only be accepted if the necessary loading space is available. Goods for dispatch must be delivered the evening before the departure of the aeroplanes at the company's offices in Amsterdam (K.L.M., Leidsche Plein), or Rotterdam (K.L.M., Coolsingel).

SLOTS FOR SWEDEN.

The Swedish Government have acquired a licence to fit Handley Page slots to all Government machines in Sweden. This is the first country in Europe to acquire such a licence.

The Handley Page Bulletin for September points out that the average figures of fatal accidents per month in the R.A.F. for the first seven months of this year are 3.7; for the whole of 1928 the figures were 6.33 per month, and in 1926 the figures were 7 per month.

As the number of squadrons in the R.A.F. have been considerably increased since 1926, considerably more flying has been done, this makes this low figure all the more creditable. As the decrease coincides with the adoption of the slot by the R.A.F., the H.P. firm's conclusion that the slot must be responsible for this improvement seems justified.

USEFUL INFORMATION.

Rowland Hill and Sons, Ltd., of Coventry, have produced a booklet called *Alpax* (*R.H.*). This booklet outlines the uses and advantages of the Aluminium-Silicon alloy known as Alpax. This name is applied to these alloys after *modification*. The modification consists of the addition under definite conditions of Sodium Salts to the alloy when in a molten condition.

Alpax is well known in the Aircraft Industry now, but no doubt many who are familiar with the alloy will be glad to learn the machining speeds and similar useful information which is to be had in this booklet. It will be sent on request, gratis and post free, to anyone who mentions The Aeroplane.

PETROL POETRY.

The amusing verses which have recently appeared in the newspaper advertisements of the British Petroleum Co. Ltd. have been collected into a booklet called *The Motorist's Rhyme-Book*.

A copy of this booklet will be sent, free of charge, to any reader who applies, mentioning The Aeroplane, to the British Petroleum Co. Ltd., Britannic House, Moorgate, E.C.2.

SITUATIONS VACANT.

Wanted, Ground Engineer with C and A Licence for Flying School at Cambridge. Apply with references to A. G. G. Marshall, Aviation Hall, Cambridge.

Fabric Covering and Doping Charge Hand required; must be able to control female labour. London district. Write stating age, past experience and approximate wages required. Box No. 1323, Shaw and Blake Ltd., 8, Bell Yard, Temple Bar, London, W.C.2. Advertising Agents.

SITUATIONS WANTED.

Young man, aged 25, married, 12 years' Electrical Engineering experience. University training, 1st class Electrical Engineering certificate, excellent references, good knowledge of petrol engines, owns car. Highly interested in Aviation desires post with Aviation Co. or Flying Club. Would study suitable course for position. Any branch in Aviation considered. Could pass Guarantee Society, or would deposit £100 security.—Apply Box No. 5723, THE AEROPLANE, Cannon House, Pilgrim Street, E.C.4.

Experienced Pilot with first hand knowledge of the Aircraft Industry, seeks position as Sales Manager. Nominal salary with an interest preferred.—Box No. 5724, THE AEROPLANE, Cannon House, Pilgrim Street, E.C.4.

TUITION.

We offer sound instruction in Aeroplane Design, Fitting and Rigging, and Aero-Engine Fitting and Rigging; also expert training for Ground Engineers (Categories A, B, C and D). All tuition is by correspondence. Write to-day for our "Aeronautical Engineering" Booklet. International Correspondence Schools Ltd., 179, International Buildings, Kingsway, W.C.2.

MISCELLANEOUS.

Petrolmotor Castings, partly machined, ½ horse (9s. 9d. per set). Catalogue 3d. Madison's Works, Wade Street, Littleover, Derby.

YOU'LL GET A BETTER BID FOR YOUR MACHINE AT BROOKLANDS.

Send full particulars of your second-hand aircraft to the Brooklands School of Flying. You'll get a better bid for it there. And a better deal when you buy a new machine in part exchange for your own. The School's Sales Manager knows the second-hand market intimately and pays the full market price

BECOME OWNER PILOTS AT THE LOWEST POSSIBLE COST.—Buy your new Moth at Brooklands—Official D.H. Agents. Through its important financial connections the School can sell on specially attractive hire purchase terms.

SERVICE AFTER SALES.—To those who buy their new Moths from us we offer FREE SERVICE for the first month. The life of an engine depends on its treatment during this period.

REPAIRS AND OVERHAULS.—The School has extensive workshops and undertakes all repairs and overhauls for C. of A.

SPECIAL CHARTER.—Four-Seater Saloon machine available at shortest notice. Any distance.

FIRST-CLASS TUITION—NO SUBSCRIPTION.—Flying tuition at Brooklands is unequalled. Since June, 30 pupils have found that to be well taught *pays* in the end. Sound instruction depends on the *experience* of the Instructor. The following are responsible for the high standard of flying at the School:—H. D. Davis, A.F.C., Managing Director and Chief Instructor, E. A. Jones, C. M. Pickthorn, M.C., J. R. King, R. Y. Bush, who between them have done 14,250 hours' flying.

Ring up Byfleet 437 to fix a trial lesson—or write to

BROOKLANDS SCHOOL OF FLYING, BYFLEET • SURREY.

The Aerodrome is forty minutes from Waterloo. Five minutes' walk from West Weybridge Station. Trains every hour.

ON THE NORTH COUNTRY'S LEAD.

Wherever the English language is spoken, the names of Hull, Hell, and Halifax are inseparably linked. Having had experience so far of the first and last, one can vouch for the fact that there are many worse places than Hull. And at the present moment Hull is taking a place in British Aviation which entitles it to high respect among the cities of the Empire.

On Thursday last, October 10, Hull earned the distinction of opening the first Municipal Aerodrome in the British Isles, and of having the opening ceremony performed by a Royal Prince—which was very fitting, seeing that Municipal Aerodromes are of the highest importance to the future of the British Empire.

Admittedly, Manchester planned to have a Municipal Aerodrome long before Hull did. But unfortunately Manchester chose to put its Municipal Aerodrome in a bog where it cannot become fully effective for a very long time. And consequently Manchester's air traffic has been worked by Northern Air Lines, Ltd., from a temporary aerodrome which, although it is much nearer and handier to the centre of the city, and has a very much better surface, than that which is ultimately to be the Municipal Aerodrome, must sooner or later be discarded municipally.

So, although Manchester thought first, Hull has acted first, and carries away the honours.

The person who is primarily responsible for this action, which will make Hull prominent in the air history of the British Empire, is Mr. Benno Pearlman, the Lord Mayor—and he has been ably seconded by Mr. J. R. Howard Roberts, the Town Clerk. Mr. Pearlman began his efforts towards the organisation of a Municipal Aerodrome as soon as he took office a year ago. And he has the deserved satisfaction of seeing the Aerodrome opened and operating before he retires at the end of his term of office.

Hull's Air Port.

A year ago, Hull's Municipal Aerodrome at Hedon was a large field with a surface of the worst kind of ridge and furrow. To-day, barring one or two soft spots which will duly settle down, it has the best and flattest surface of any aerodrome one has seen, with the possible exception of the Heston Air Park. One gathers that Mr. T. Thomas, the City Engineer, has been in charge of operations.

To the East and North there is fine, open country, and the approach to the aerodrome against the prevailing winds is ideal. There are hardly any trees near enough to the edge to bother the worst of pilots, and between the aerodrome and the river there are fields where a machine can be put down easily enough in case of an engine cutting out immediately after getting off.

There is a fine wide new road from the aerodrome down to the Humber, only three-quarters of a mile away, where a seaplane base will in due course be bullt. So any workshop jobs needed for the seaplanes can be done at the Hedon Aerodrome itself, pending such time as the seaplane station is being developed.

There is no city in England where the prospects of an aerodrome becoming a paying proposition within a short time are so promising as they are at Hull. A very big trade with Scandinavia and Holland, and through those countries to Germany and the Baltic States, is done from Hull. Also, a vast amount of the trade of Liverpool and Manchester and Leeds and Bradford, and all that vast area of North Country industrial cities and towns, comes through Hull.

Naturally, therefore, mails from all that area, especially including parcels and samples, and actual deliveries of the more valuable goods, should provide enough load to keep quite a good flying-boat service going from Hull across the North Sea.

"FOR PRINCES ARE THE GLASS, THE SCHOOL, THE BOOK, WHERE SUBJECTS' EYES DO LEARN, DO READ, DO LOOK."

—(SHAKSPEARE—*Lucrece*.)

A ROYAL EXAMPLE.—H.R.H. Prince George opening the Hull Municipal Aerodrome, after arriving and before departing by air. On the left of the picture are the Lord Mayor of Kingston-upon-Hull (Councillor Benno Pearlman) and the Chief Constable of the West Riding. On the right is the Lady Mayoress (Mrs. Pearlman). Let us hope that all Yorkshire will learn from Prince George to use the aerodrome to full advantage.

Digitized by Google

The prospects of this trade were foreseen many years ago by Mr. Robert Blackburn and his associates, who formed the North Sea & General Aerial Transport Co., Ltd. And the claims of Hull to consideration as a North Sea air-port have often been pressed in the House of Commons by Lieutenant-Commander the Honourable J. M. Kenworthy, M.P.

Unfortunately, developments have been so slow that the North Sea & General Aerial Transport Co. did its first practical work astride the Equator from Khartum to Uganda, showing the firm to be more General than North Sea. These delays are no fault of either the Blackburn group or of Lieutenant-Commander Kenworthy. They were simply due to the natural caution of the North Country business people. And the driving energy of Mr. Pearlman was the one thing necessary to bring the air-port to life.

Quite a long time ago one said in this paper that we should never be able to look on aviation as a commercial proposition until the Jews came into it. Mr. Pearlman is a Jew of that type which has done so much to keep the British Empire in the lead of the World's commerce in spite of the caution, so often amounting to stupidity and cowardice, of the ordinary English business man.

He is a Jew of the same kind which has given to this country the Rothschilds and Disraeli. Mr. Pearlman would be the last person to put himself on a level with those distinguished men, but he has in him the same kind of foresight, political and financial, which made them what they became. He is still quite a young man, and one can only hope that in wealth and distinction he may attain to something approaching their levels. He deserves it if only for the service which he has done to British aviation by providing the first Municipal Aerodrome in the British Empire.

One swallow does not make a summer, and one Jew does not make a national business. But one does hope most sincerely that Mr. Pearlman's advent into aviation is just a sign of the times, and that Commercial Aviation will soon be on such footing that it will be regarded as a business proposition by other Jewish business men of the right class.

The Opening Ceremonies.

Actually, the opening of the Aerodrome was skilfully arranged to coincide with the opening of Hull's Civic and Empire Week. And His Royal Highness Prince George was invited to come to Hull to open both the Civic and Empire Exhibition and the Aerodrome.

Before the aerodrome could be opened, naturally it had to have a licence from the Air Ministry. And, naturally, to fit the occasion, that licence had to be brought by air. So the licence was brought from London to Sherburn-in-Elmet, which is the Yorkshire Aeroplane Club's aerodrome.

There it was met by Mr. Pearlman and Mr. Howard Roberts. Mr. Roberts was flown back to Hull by Mr. E. D. Ayre, who will be the N.F.S. Manager of the aerodrome, and Mr. Pearlman was flown back by Mr. Neville Stack, the chief pilot of N.F.S.

According to Mr. Stack, while he was getting the Lord Mayor ready to get into the machine, he (Mr. Stack) apologised for not having proper flying kit for him, and especially regretted the lack of a helmet. The Lord Mayor replied that it really did not matter, because all Sherburn was in Elmet already. If this story is a libel, the sin is on Mr. Stack's head.

So the licence for Hedon duly arrived there by air, and with everybody in a good humour.

Prince George has done quite a good deal of flying, especially when he was serving with the Navy, but this was his first flight for an official purpose. Fortunately the weather was fine and did not interfere with his programme. He flew from Sunningdale to the Blackburn aerodrome at Brough in a Westland Wapiti piloted by Sq. Ldr. Don, Officer Commanding the Communication Squadron at Northolt, and was accompanied by his Comptroller, Major Ulick Alexander, also in a Wapiti, piloted by Flg. Off. Stemp, also of the Communication Squadron, and a third Wapiti accompanied them in case of a breakdown.

The machines arrived at Brough at 11.00 hours almost to the minute. Thence Prince George motored to Hull, where he was met at the city boundary by the Lord Mayor, whereafter he opened the Civic and Empire Exhibition and formally opened the new University College.

After lunch at the Guild Hall, Prince George motored out to Hedon, where an enormous crowd had already gathered. One has no official figures, but at a guess one would put the number of people inside the aerodrome at about 35,000. Half an hour or so before the Prince arrived the crowd was so great that the aerodrome authorities simply had to give up any idea of taking their money, and had to rush them through the gates as fast as they could move, to relieve the pressure on those jammed against the barriers.

Good Work.

This encouraging state of airmindedness was certainly largely due to the preliminary work done by the local Press, especially by *The Eastern Morning News* and *The Hull Evening News*, the Managing Editor of which papers is Mr. Mark Goulden, who takes the keenest interest in

A PRELIMINARY.—Left to right: Mr. E. D. Ayre (N.F.S. Manager at Hedon), Mr. Howard Roberts (Town Clerk of Hull), Councillor Pearlman (Lord Mayor of Hull) and Mr. Neville Stack (Chief Pilot of N.F.S.) ready to bring the Hedon licence from Sherburn-in-Elmet.

British Triumphs
in the Air, on Land and Sea

1918 A Napier-engined D.H. aeroplane climbed to a height of 30,500 feet in 66 minutes. At this time no human being had ever soared so high.

1921 A Napier-engined Gloster aeroplane won the Aerial Derby. Speed 163·4 m.p.h.

1922 A Napier-engined Supermarine flying-boat regained the Schneider Trophy for Great Britain at a speed of 149 m.p.h.

1922 A Napier-engined Gloster aeroplane won the Aerial Derby. Speed 180 m.p.h.

1923 A Napier-engined Gloster aeroplane won the Aerial Derby. Speed 192.4 m.p.h.

1926 The first non-stop crossing of South Atlantic Ocean carried out by Commandante Franco flying a Dornier flying-boat with two Napier engines.

1927 Schneider Trophy won by a Napier-engined Supermarine-Napier seaplane flown by Flight-Lieut. S. N. Webster, A.F.C. Speed 281.669 m.p.h.

1928 Capt. H. S. Broad, flying D.H. Hound, fitted with Napier engine, secured three World's speed records whilst carrying loads of 500 and 1,000 kilogrammes.

1928 The greatest formation flight ever carried out was made with four Supermarine-Napier Southampton flying-boats, each fitted with two Napier engines. The machines flew from England to Australia, round Australia and back to Singapore, covering 180,800 engine miles without mechanical trouble.

1929 The first non-stop flight from England to India was carried out with a Fairey monoplane fitted with Napier engine. 4,130 miles in 50 hrs. 38 mins.

* * * *

1929 The highest speed ever attained on land was made by Major Sir Henry Segrave when he drove his Irving-Napier car over one mile at the amazing speed of 231.36 m.p.h.
Capt. Malcolm Campbell set up world's land speed records at Verneuk Pan with his Napier Arrol-Aster as follows :—over 5 miles, speed 211 m.p.h.; over 5 kilometres, speed 216.53 m.p.h. They both used Napier engines.

* * * *

1929 The world's motor-boat speed championship was won at Miami by Major Sir Henry Segrave, driving Sir Charles Wakefield's Napier-engined "Miss England."
Sir Henry Segrave at the Lido with the same boat made six runs over the measured mile, averaging a speed of 92.8 m.p.h.
At this meeting, competing against the best from Italy and America, Sir Henry Segrave won all trophies including the Duke of Piedmont's cup and Count Volpi's cup.

aviation and, after acting as Honorary Secretary of the Air Pageant, intends to act, for the immediate future, at any rate, as the Secretary of the Hull Flying Club which is being formed in connection with the aerodrome.

As has already been said, the aerodrome belongs to the City of Hull, and all the expense of ploughing, levelling, draining, turfing, fencing, and so forth has been borne by the city. It has now been let on a twenty-one years' lease to National Flying Services, Ltd., who will see to the equipment of the aerodrome with adequate buildings suitable for the housing and refreshment of man and machine. A Flying Club will be formed which will be supplied with machines and instructors by N.F.S., Ltd., and the usual work of running a taxi service and joy-riding will be done. Housing and service will be provided for visiting aircraft. The aerodrome will be under the charge of Mr. E. D. Ayre.

Prospects.

Considered solely as an air-park, and leaving out its importance as an international air-port, the aerodrome at Hedon should have particularly bright prospects. In any reasonable weather on any reasonable aeroplane London can be reached from Hull Aerodrome in a very little over two hours, whereas the best trains take five hours—which, as Euclid used to say, is absurd. Consequently, with any reasonable boosting and anything like efficient service, N.F.S. ought to be able to work up a first-class taxi-service between Hull and London.

One does not suggest starting up a regular air-line, because, as has so often been said in this paper, the weather anywhere North of Birmingham is liable to such bad patches in winter, more particularly in November and February, that no air-line could hope to fly to schedule. And as soon as the thing is called an air-line, it has to run to schedule or be considered a failure. On the other hand, an air-taxi service can do all that an air-line does, and more, and need not keep to any time-table.

Also, now that so many thousands of men, and so many firms, keep aircraft for purely business purposes, there should be a great deal of business to be done at Hedon in housing the aeroplanes of business people. Therefore, one considers the future of the Hull Aerodrome and of the N.F.S. detachment there are particularly bright. And one hopes most sincerely that the management and the organisation will be such as to justify the faith which Mr. Pearlman has shown in staking his reputation on the success of a Municipal Air Port.

At Hedon.

The air pageant which marked the opening of the Hull Aerodrome actually began some time before the opening ceremony.

First of all Mr. Blake gave a display of aerobatics in the Blackburn Lincock (Armstrong Siddeley Lynx). Mr. John Clarke, of 29 Squadron, R.A.F., also flew the machine, and told one later that it was one of the nicest machines to handle that he had ever met.

Then there was a fly-past of visiting aircraft in which the vast Beardmore Inflexible, which had come up from Martlesham, took part. This aerial "tank" caused quite a sensation.

After that came the Kingston-upon-Hull Light Aeroplane Race. We all talk about Hull, but officially that city is Kingston-upon-Hull, with a county attached. The first charter was, in fact, granted by King Edward I in about the year 1600.

The entries for the light aeroplane race were Flt. Lt. Scroggs (D.H.53), Mr. Norman Blackburn (Bluebird), Mr. N. S. Percival (Avian), Mr. Kemp of Newcastle (Moth), Mr. Wheatley (Moth), Flt.-Lt. le Poer Trench (Avian-Hermes), and Mr. Cazalet (Widgeon-Hermes). Flt. Lt. Trench won.

The event is worthy of notice because it was actually the first race won by a Hermes engine, and it was won by the identical engine and identical machine which so very nearly won the King's Cup this year, when piloted by Mr. Stack. Mr. Kemp of Newcastle was second.

At 14.40 hours promptly H.R.H. Prince George officially opened the Hull Municipal Aerodrome and the Hull Aero Club. He said:—

Ladies and Gentlemen,—It was with great pleasure that I accepted the invitation to open this aerodrome, and though I had little experience of flying, I at once decided to increase my knowledge of modern methods of transport by undertaking the journey by air. It has been a most enjoyable experience, and one which I hope to repeat when visiting other parts of the country.

The opening of this aerodrome is, I venture to say, one of the greatest strides in modern development that a city could take, and your Corporation is to be congratulated upon their enterprise and preparedness for what future requirements will inevitably demand. The history of the evolution of transport is, indeed, amazing, and education to-day has made it apparent to all that in future no city or town will be able to hold its own without adequate facilities for aircraft.

Your Corporation has acquired a splendid site in very close proximity to the city and the River Humber, and one can readily visualise a great future for the Air Port of Hull.

In congratulating your Corporation, I would also pay a warm tribute to National Flying Services, Ltd.—your tenants—whose scheme, which aims at instituting a chain of aerodromes and landing grounds throughout the length and breadth of the land, is highly progressive and deserving of every success.

It is most fitting that the opening of your Aerodrome should be celebrated by the holding of the first Hull Air Pageant, and I con-

IN WINNING VEIN.—Flt. Lt. le Poer Trench, R.A.F., and Mr. Kemp, of the Newcastle Club, with their cups, and Flt. Lt. Rose, of the Anglo-American Co., with a plinth, at Hedon.—(*"Aeroplane" photograph.*)

gratulate the organisers and all who are taking part in to-day's important event.

I have much pleasure in declaring open the Hull Municipal Aerodrome, and trust that this will not be the last occasion upon which I may use your Air Station.

His speech was somewhat drowned by the tactless Inflexible which cruised round during his first few sentences. But that was because he began a few minutes too soon. A rocket was fired for the Inflexible to land at the moment originally fixed. The rocket went up and the Inflexible came down simultaneously. But the speech was then well away.

PRESENTATIONS.

After his speech, Prince George presented the prizes in the light aeroplane race to Flt. Lt. Trench and Mr. Kemp. And thereafter a number of the aldermen and other people of importance in Hull were presented to him.

After them, Mr. J. G. Peel, J.P. (Vice-Chairman of N.F.S., Ltd.), Lt.-Col. Ivo Edwards, C.M.G. (Managing Director), Mr. G. E. F. Boyes (Deputy Managing Director), and Capt. T. Neville Stack were presented to the Prince.

Following them, the organisers of the air pageant, Col. E. R. Thackwell, Mr. Mark Goulden, and Capt. G. Thompson were presented. And Prince George left soon afterwards.

Among the feminine visitors to the pageant were a number of the members of the Forum Club, who have been prominent in forming an aviation section of that female Club. Most of them came to Hull with Sir Alan Cobham in his Giant-Moth the *Youth of Britain*. But Lady Bailey, of course, came down in her own Moth.

By some extraordinary mistake no place was provided in the Giant-Moth for Lady Cobham, so she had to come down by train. However, personally one has no cause to grumble, for the mistake made what would have been a long and dull train journey for the present writer into an extremely pleasant one.

Among the aeronautical visitors were Lord Thomson (Secretary of State for Air), Miss Winifred Brown from Manchester, Mr. Runciman and Miss Leatheart from Cramlington, Flt. Lt. Rose, and Mr. Hanstock, of the Anglo-American Co., and Mr. Olley of Imperial Airways, who brought Lord Thomson and a party in a Handley-Page.

THE DISPLAY.

Before Prince George started for home in his official Wapiti, No. 29 Fighter Squadron, R.A.F., began one of their excellent displays. The programme was identical with that which they gave at Newcastle on the previous Saturday, and there is nothing to be added to or subtracted from what one said last week about their flying.

The wind was much as it was at Newcastle, and the visibility was no better and no worse. In spite of that, the formation flying was as nearly as no matter perfect. Halfway through the performance one engine cut out, and the pilot had to land. The trouble was said to be a breakage in the supercharger. The spare machine was rather slow in starting up and joining the formation, but when it did join up the pilot flew with the same precision as the rest.

The converging attack on an encampment was done bv three machines instead of four, and to that extent was a little less alarming. But it was splendidly done.

Mr. John Clarke and Serjt. Morton did their combined aerobatics as neatly as ever, though afterwards Mr. Clarke said that he was dissatisfied with the show and was not flying up to his proper form.

A ROYAL EXAMPLE.—Prince George embarking in his Westland Wapiti (Bristol Jupiter) to leave Hedon.

Much to his disappointment, Mr. John Tranum was not allowed to do his almost inevitable parachute drop. The wind was so strong that those in charge of the aerodrome thought that he would land too fast. And by the time the wind had dropped, darkness had set in.

Consequently, the next event was a display of aerobatics by Mr. Neville Stack in the Avian with the Hermes engine which was presented to him by A.D.C. Aircraft Ltd. as a mark of appreciation when he left that firm to become chief pilot to N.F.S. Ltd.

Mr. Stack has long been recognised as one of the best pilots in this country, but the Hermes allows the Avian to do things which are not done by other light aeroplanes. He does a quick roll with a wriggle in the middle of it which is quite one of the most comic things any aeroplane has done. One only hopes that it will not wriggle the tail off the machine. Also with the Hermes he does that trick

A FIRST APPEARANCE.—The first British-built Desoutter monoplane (Hermes engine) at Hedon.

of flying on one ear along the front of the enclosure much better than it can be done with lower power.

The last event was an exhibition of formation flying and combined aerobatics by three of the N.F.S. pilots—Messrs. Schofield (leader), Wilson, and Mackenzie. Nothing neater in the way of combined flying has been seen anywhere than those three in their Moths.

Altogether the whole Air Pageant was as good a show as has been seen, but as these exhibitions have been described over and over again during the almost weekly flying meetings of the past Summer, there is no need to describe any of the flying in further detail.

During the afternoon the Blackburn Iris flying-boat paid a visit to the aerodrome and gave people a fair idea of what a modern flying-boat looks like compared with the funny old Americas and F.2as and things of that sort which operated from Immingham during the War,—apart from which all that is so long ago that probably 50 per cent. of the crowd which saw the Iris are too young to remember anything of the War-time boats.

The Ideal Hostess.

After the meeting was all over, and after a very cheery dinner in which 29 Squadron and a good many of the civil aviators combined at the Station Hotel, we all went on to a Ball given by the Lady Mayoress.

Making full allowances for Mr. Pearlman's outstanding ability, which enabled him to build up such a business that he can afford to be Lord Mayor of such an important place as Hull on an entirely inadequate municipal allowance for entertainment, and allowing for those intellectual qualities which inspired him to back aviation at precisely the right moment, one must express the belief—which he would certainly confirm—that his success in life is very largely due to the support given to him by his wife. Seldom has one come across a hostess who played her part so ably as did Mrs. Pearlman.

The party included a number of Naval Officers from a submarine which was visiting Hull in connection with the Civic Week—they had not sunk it by accident and been washed ashore, as one anti-naval aviator suggested. There were all the officers of No. 29 Squadron, R.A.F., and several other R.A.F. officers, Staff and otherwise. There were all the civil aviators. And there were all the people who had anything to do with the organising or running of the air display and the aerodrome.

Mrs. Pearlman had skilfully acquired an adequate number of partners, and she treated everybody as if he or she were a personal friend and not merely an official guest. They all enjoyed themselves thoroughly, and they were all quite sorry when the band played "God Save the King" at about 2 a.m.

If all Lord Mayors' parties were as cheery and as free from formality as was that at Hull, people would be much more pleased to attend such functions. On behalf of all her aeronautical guests, one tenders thanks for a charming party.

Taking it all round, the inauguration of Hull's Municipal Aerodrome was quite one of the most successful things in this year's extraordinary aeronautical activity. Considering that the date was fixed so late in the year, the odds were against having decent weather, but even the weather was kindly.

Everything else was thoroughly well done. The actual running of the meeting, and the laying out of the aerodrome by National Flying Services, Ltd., showed that this organisation can run an aerodrome thoroughly well. In fact, everything in connection with the Hull Aerodrome begins under the happiest auspices.

One can only hope that it may continue in the same way, and that Mr. and Mrs. Pearlman, who incidentally have thoroughly well earned a title by their activities this year, may continue to take an active interest in the Air Port which they have done so much to create.—C. G. G.

THE AWAKENING OF LEEDS.

On October 11 the Right Honourable the Lord Brotherton of Wakefield, as President of the Yorkshire Aeroplane Club, Ltd., gave a lunch at the Queen's Hotel, Leeds, to celebrate the amalgamation of the Yorkshire Aeroplane Club, Ltd., with National Flying Services, Ltd. This amalgamation, or absorption, is likely to have far-reaching effects on the development of aviation in the North Country, second only in importance to the starting of the Municipal Aerodrome at Hull.

The Yorkshire Aeroplane Club was one of the original subsidised clubs, and it has done a large amount of very good work. But, being handled by a voluntary—not to say amateur—Committee, and not by a board of commercial men, it, like so many other clubs, has been hard set at times to make both ends meet, and now and again it has been distinctly on the wrong side of its balance-sheet. More recently, by doing away with its paid secretary, and by cutting down its expenses in every possible way, and thanks partly to good luck in the matter of crashes, and skilful technical management by Flt. Lt. Worrall, its instructor,

A WINNER.—The Avro-Avian (Hermes engine), which Mr. Stack flew in the King's Cup Race. **At Hedon it won for the first time, piloted by Flt. Lt. le Poer Trench.**—(*"Aeroplane" photograph.*)

ARMSTRONG WHITWORTH
AIRCRAFT

THE ALL STEEL ATLAS

(ON WHEELS, FLOATS OR SKIS)

THE all-steel Atlas is the best aircraft for land or sea reconnaissance.

It is the standard Army Co-operation two-seater of the Royal Air Force.

Its steel construction accounts for its unrivalled durability and ease of maintenance. Fitted with the world-famous Armstrong Siddeley Jaguar engine (plain or geared type), its speed, climb and ceiling fulfil the severest Service requirements. It is produced on the grand scale by the best equipped aircraft works in Europe.

it has managed to become solvent by the time of its absorption.

The amalgamation itself brings about an interesting and rather curious situation. The Yorkshire Aeroplane Club's agreement with the Air Ministry for a subsidy of £50 per head on every pilot trained by the Club was made between the Yorkshire Aeroplane Club, Ltd., and the Air Ministry. National Flying Services, Ltd., having bought the shares in the Yorkshire Aeroplane Club, acquire automatically this agreement with the Air Ministry. Consequently all pilots trained by N.F.S., Ltd., as proprietors of the Yorkshire Aeroplane Club, Ltd., draw from the Air Ministry the subsidy allocated to the Club until the subsidy agreement expires next year.

The subsidy per pilot agreed with the Light Aeroplane Clubs is £50. The subsidy to be paid to N.F.S., Ltd., by the Air Ministry is £10 per pilot. Consequently pilots trained by N.F.S., Ltd., as owners of the Yorkshire Club, will be much more profitable than those trained under their direct agreement.

An interesting point arises further as to the position of representatives of the Yorkshire Aeroplane Club in the Council of the Associated Flying Clubs. Presumably so long as these representatives are actually elected by the members in Yorkshire, and do represent Yorkshire opinion, their position in this matter remains unchanged.

A Strategic Point.

Actually the affairs of the Yorkshire Aeroplane Club are a comparatively minor factor in the situation as it affects aviation in the West Riding of Yorkshire. Hitherto the Yorkshire Club has operated at Sherburn-in-Elmet, a disused R.A.F. aerodrome which, considered purely as an aerodrome, is one of the finest in the World. Unfortunately it is fifteen miles from Leeds, and, though it can be reached in half an hour by a good driver in a fast car, the first few miles out of Leeds are through heavy traffic, and the last few miles are along narrow roads, so the time usually taken is about forty-five minutes.

National Flying Services, Ltd., propose to operate an aerodrome at Yeadon which is about seven miles from the middle of Leeds, seven miles from the middle of Bradford, and about eight miles from Harrogate, so that actually it is only about fifteen or twenty minutes' drive from two big cities and a health resort, which between them ought to provide an enormous amount of work for a well-run taxi service.

Leeds is between four and four-and-a-half hours by rail from London, Bradford is a little more, and Harrogate is a good deal more. Yeadon is only between two and two-and-a-half hours from London by Air. And as it will tap not only the business men of Bradford and Leeds communicating with London, but also the people from all over England going to and from Harrogate, it ought to be successful if any aerodrome ever is to be. Colonel Edwards and the Directors of National Flying Services are to be complimented on their business acumen in fixing on this site as soon as the opportunity was offered.

The Speakers.

Lord Brotherton, proposing the toast of the amalgamation, said that the Aeroplane Clubs were conceived in the brain of the Director of Civic Aviation. The Yorkshire Club got its first machine in 1923, and he considered that they were wonderful in being able to carry on so long. No club could wish for a more conscientious staff. Yorkshire might well be proud of the fact that the Club now had 168 flying members, 116 associates, and 48 lady members. He said that although the Club was solvent, it could not carry on after 1930 without a subsidy, and so it had amalgamated with National Flying Services, Ltd.

Lieut.-Col. Ivo Edwards, C.M.G., Chairman of National Flying Services, Ltd., thanked Lord Brotherton for promising to continue as President of the Club after the amalgamation, and for his generous gesture in giving this lunch. He hoped that N.F.S., Ltd., would increase the activity of the Club. He stated that N.F.S. had taken over the Hull Aerodrome from the municipality on a twenty-one years' lease.

He pointed out that aerodromes were no use as mere open spaces, they had to be properly equipped and administered. And they hoped to take over many other aerodromes from municipalities to run them with their specialised knowledge. N.F.S. hoped to have 25 aerodromes and 100 landing grounds in operation in Great Britain.

Col. Edwards told us that if there were aerodromes 1,000 yards square every 10 miles all over the country, they would even then only take up 5 per cent. of the space at present occupied by roads and railways.

He said that flying clubs were not merely places of amusement. We were always talking about pushing trade, but nothing was being done to stimulate and speed-up connections. Aviation would have to correct that. If Sir Sefton Brancker were allowed to spend as many millions on aviation as Mr. Thomas intended to spend on roads, trade would be helped much more. And the flying clubs would help public opinion to think aright

We had to sell Aviation to the Nation, Colonel Edwards said, and Flying Clubs were the best way of selling it. Fishermen and golfers told wonderful tales of their exploits, but aviators habitually made wonderful flights without telling exaggerated stories. [Col. Edwards is quite right about the average aviator—but has he never met the born line-shooter.—C. G. G.]

N.F.S. wanted to encourage members of the Clubs to fly far. So they wanted to lay out landing grounds. They wanted particularly to bring this country up to the level of the Continent.

On the subject of purely commercial prospects, Col. Edwards said that the Koninklijke Luchtvaart Maatschappij (K.L.M.) had told him that over 25 per cent. of the passengers which they brought to Croydon from Germany and Scandinavia and Holland wanted to fly on further in England, and most of them wanted to go to Leeds and Bradford. Consequently N.F.S. wanted landing grounds all over the North, which could be fed from Leeds.

"A PRAIRIE LIFE FOR ME" (Billy Merson).—R.101 at liberty. In spite of her official lettering she is no joke.

In conclusion, he thanked Lord Brotherton for his good work, and he hoped that other business men would follow his example. He added that he was glad that Captain Wayman, Chairman of the Yorkshire Club, had accepted a seat on the Board of the new Company.

Air Vice-Marshal Sir Sefton Brancker, Director of Civil Aviation, proposing the toast of "Air Ports," apologised for the absence of Lord Thomson.

He quoted from a copy of *The Times*, issued eighty or ninety years ago, which recorded the fact that Queen Victoria had travelled by train from London to Slough on her way to Windsor, and hoped that our Gracious Sovereign would not continue to take such risks. That, he said, was the attitude of many people towards flying to-day.

Sir Sefton said that so far this country was supreme on the sea because of its geographical position. Our new aerial transport occupied a place half-way between shipping and wireless. It would place inland cities on terms with seaports in that passengers, mails, goods and bullion could be carried without touching the sea.

In America his opposite number was spending a million a year on organising air routes. There the Government paid for the lighting and signalling arrangements along the routes, and the municipalities paid for the Air Ports themselves.

He recalled that two years ago the Air Ministry had sent out a circular drawing the attention of municipalities to the importance of organising landing grounds. He recalled that in the last five years he had visited Leeds a great many times, and he had only visited Hull once. But Hull had taken the lead in establishing an air-port. In the campaign for aerodromes the Ministry had sent out experts many times to advise municipalities.

Sir Alan Cobham had visited about sixty cities [actually the number is now one hundred.—C. G. G.] to find the best place for aerodromes. And N.F.S., Ltd., would undertake to organise any aerodrome.

He recalled that Lord Brotherton at the beginning of his speech had referred to him, Sir Sefton, as the Director of Civic Aviation. He himself wanted to see the Lord Mayors Directors of Civic Aviation in every city, while he himself attended to Civil Aviation. The Air Ministry was willing to help in every way, except financially.

National Flying Services, Ltd., intended to start economically, but he believed that in three or four years they would pay their way.

He reminded his hearers that there were plenty of other municipal enterprises which did not pay.

Turning to the present Lord Mayor, Sir Sefton congratulated him on having had a flight together with the Lady Mayoress. He reminded him that the preceding Lord Mayor of Leeds had said that he was keeping his experiences in the air for the next life, and he was glad to see that the present Lord Mayor was not so optimistic. [To appreciate this remark, one has to know that the present Lord Mayor of Leeds is one of the leaders of religious thought in that city.—C. G. G.]

Sir Sefton ended by hoping that Leeds would provide a really good Air Port.

Major J. Milner, M.C., T.D., LL.D., M.P., Chairman of the Leeds Corporation Improvements Committee, and Labour M.P. for the safest seat in Leeds, said that he had been charged by the Lord Mayors of Leeds and Bradford to express their appreciation of Lord Brotherton's work in this matter. He said that he was able to say, on the authority of Mr. Lunn [the Miners' M.P., Labour Member for the Rothwell Division of the West Riding of Yorkshire.—C. G. G.] that the subsidies for the Flying Clubs would not be taken off next year. He said that the most popular aviator in the United States to-day was our Prime Minister, so there was no need to fear for our aviation in this country.

He found that Sir Sefton Brancker was disappointed in not already having an air-port at Leeds. Some years ago Yeadon had been fixed on as the most suitable place for both Leeds and Bradford. The Corporation of Leeds had got options on the site, and they were told that they were not wise in their choice. They engaged Sir Alan Cobham to come and advise them, but he had not yet come, but they were hoping to see him the next week.

Meantime they had had meteorological observations taken with the help of Professor Gilligan of Leeds University, and these had been quite satisfactory. He ventured to prophesy that within a few months the aerodrome would be ready. He said that they had been much helped by the representatives of Bradford.

Speaking for himself, he said that he did not care how soon the railway vouchers which were given to M.P.s were made available by air. Then M.P.s could run up and down between their constituencies and London every day instead of once a week.

He said that he wished to make clear how much his Committee had been helped by Sir Sefton Brancker, and he quoted the saying: "Where there is no vision, the people perish."

Sir Benjamin Dawson, Bart., J.P., proposing the health of the Chairman, said that Lord Brotherton was well known for his philanthropy and business genius. He knew that air transport must come, and he wished to help. He himself recalled the days when he was caught in a motor trap for doing twelve miles an hour, and was not held up at the end of the trap, but was *overtaken* by a policeman on a bicycle.

Sir Benjamin said that business men were not interested in aviation because of fear, partly financial and partly physical. [This is a notable pronouncement, which deserves to be quoted over and over again. This state of affairs is, in fact, the root of what the successful business man prefers to call caution in business.—C. G. G.] Sir Benjamin said that very soon these same business men would be clamouring to be allowed to take an interest in aerodromes.

Some time ago he had begun to take lessons at Sherburn, but gave it up simply because his insurance firms refused to cover him against air accidents. Illustrating the other point of view, he told a story of a young friend of his, an enthusiast for aviation, whom he had taken by car to see Stonehenge. The only interest that the boy showed in the place was when he asked why the people who built it were such fools as to stick up these old stones so close to an aerodrome.

Lord Brotherton, replying, said that he wanted a description of an ideal aerodrome. He was not clear about its size or shape or its equipment. [The Aeroplane hopes to provide His Lordship with all this information in its Special Air-Park Issue.—C. G. G.] He said that he was glad to see so many ladies interested in flying. The Yorkshire Club had forty-three lady members. He himself had the greatest admiration for those who promoted flying. Sir Sefton Brancker, he said, travelled more by air than most people do by rail. He also referred to Lady Bailey, whose presence he was glad to welcome.

He said how glad he was that Leeds and Bradford had taken hold in earnest. Air transport was a problem for business men as a way of saving money, because time was money. And he believed that air transport was an effective way of increasing profits. He proposed a toast to "The Ladies."

The Hon. Lady Bailey, who is a Director of National Flying Services, Ltd., said that she hoped that this gathering would produce an air-port. She congratulated Leeds on taking action. She hoped that regular air services were not far off. And she wished to acknowledge the help and kindness which she had received from the lady members of the Yorkshire Club.

Finis.

So ended what was really a very pleasant affair. Undoubtedly the idea of an aeroplane equidistant from Bradford, York, and Leeds is excellent. One only hopes that the business men of Leeds and Bradford will perceive the benefit of air transport.

Ever since aviation began, some twenty years ago, one has attended meetings of business men, from Mansion House meetings downwards, at which prominent business men have confessed their faith in aviation. But so far none of them have testified to their faith by embarking their money or their carcasses on an aviation venture. As Sir Benjamin Dawson wisely said, they are afraid, both financially and physically.

Whether air transport becomes a success in Hull and Leeds will depend very largely on the business methods of National Flying Services, Ltd. Merely spending money on local advertising will not produce the business. Business will only be got by the methods used for years by the railway companies and shipping companies. Goods traffic must be got first, and passenger traffic will follow. So one suggests that the first thing to do is to put on really good freight canvassers in the North Country towns.

Naturally, there will be a certain amount of passenger traffic, which ought to be enough to make taxi services pay in a modest way. There will always be enterprising business men who will fly to London and back, and to other cities where they do business, some because they are really in a hurry, some because they want to swank about it personally, and some because they regard such journeys as a good advertisement.

Some few weeks ago this paper recorded the fact that three of the Horne Brothers, the big haberdashers who have stores all over the country, have two Moths which they fly about Great Britain inspecting their various shops and depots. So far as one can discover they do not make any song about it. And they certainly do not use their flying as an advertisement for their stores. But business men whose interests are in one particular locality certainly could get quite a fair amount of local advertising by using aircraft habitually on business trips.

Business men's promises are worth very little. One knows several cases in which firms embarked on aviation ventures, and other ventures also, because they were assured of the support of prominent business men or firms. And always they have found themselves let down. Unless you can show a business man a direct profit he will find some way of backing out of any promises which he may have made under the influence of a good lunch or a good dinner or of momentary enthusiasm.

Happily, both the Yeadon Aerodrome at Leeds and the Hedon Aerodrome at Hull can offer direct profits to the business men of those communities, always provided that the business management of the aerodrome is good enough. And at any rate, Yorkshire, both in the East Riding and the West Riding, can justifiably claim to have taken the lead over the rest of England.

Incidentally, names of aerodromes are apt to become a trifle confusing to the ear and the eye. Yeadon and Hedon are not far apart aurally. Hedon, Hendon, and Heston may easily be confused by readers of average modern handwriting, let alone by those afflicted with the uneducated people who manage to be employed as typists. But, after all, confusion over names of aerodromes is better than having no aerodromes at all. So let us hope for the best.—C. G. G.

HONOUR IS SATISFIED.

The Board of Admiralty has received a letter from the Air Council expressing the grateful appreciation of the Air Council for the assistance given by the Royal Navy in connection with the contest for the Schneider Trophy.

In the letter the Air Council requested their Lordships to convey to the Commander-in-Chief at Portsmouth and to all the officers and men of the Portsmouth Command who assisted in the arrangements, an expression of their appreciation and thanks.

AIR HISTORY IN THE MAKING.

On November 5 there will be held in London a Conference, under the auspices of the Royal Aeronautical Society, the Royal Aero Club, and the Air League, which is likely to affect vitally the whole course of British Civil Aviation.

As is well known, Sir Alan Cobham has, during the past Summer, devoted his whole time and his amazing energy to a great crusade for the organisation of aerodromes all over Great Britain. He has been touring the whole country in his De Havilland Giant-Moth (Armstrong Siddeley Jaguar engine), named *The Youth of Britain*, and has visited just on a hundred cities and towns.

At each town he has taken up the Lord Mayor, or Mayor, and various members of the Corporation. He has also taken up permanent officials, such as Town Clerks, Borough Surveyors, City Engineers, and so forth, so that they could see their own cities from above and judge for themselves where aerodromes and landing grounds are possible and which is the best direction in which to place them.

In the course of this tour, by the munificence of Sir Charles Wakefield, Sir Alan has also taken up thousands of school-children, so that the rising generation may, in the years to come when air transport is as common as motor-car transport to-day, be able to say that they themselves saw their home towns from the air before such a thing as a municipal aerodrome existed. This will in fact be very much as if people existed to-day who could remember our chief towns before there were any railway stations.

By way of bringing to a head the movement to which he has given such an immense psychological momentum Sir Alan Cobham is arranging for November 5 a Conference in London of Lord Mayors, or Mayors, and other officials of each of the cities or towns which he has visited. The idea is to invite three officials from each of the hundred municipalities concerned.

Certain authorities in Civil Aviation will address them briefly on their own special subjects, and the municipal authorities will be invited to ask all the questions they can. And one gathers that after the conference they will all be entertained to dinner by Sir Charles Wakefield,—who, as usual, is acting as the Patron Saint of British Aviation.

Before anything was known of this Conference, we who are responsible for THE AEROPLANE had decided to produce a Special Air-Park Issue at the end of October. When Sir Alan Cobham was asked to write an article for this issue he disclosed the fact that he was already arranging to have this Conference in London on October 16. Therefore, to make the Air-Park Issue of THE AEROPLANE as useful as possible to Sir Alan's aerodrome crusade, arrangements were made to produce the Air-Park Issue on October 23 so as to include a full report of the Conference.

Further consideration showed that October 16 was a bad date for the Conference, because it would clash with the Motor Show at Olympia. Consequently Sir Alan very wisely put the date forward to November 5, when there is not likely to be very much happening, and, consequently, the daily newspapers will be able to give something like adequate attention to a subject which is of such vital importance to British Aviation.

Yet more consideration of the circumstances, in consultation with Sir Alan Cobham, has caused us to fix the date for our Air-Park Issue as October 30. The idea is that by producing in the last days of October an issue which will deal fully with all the requirements of aerodromes, and answers from every possible angle the question put at Leeds by Lord Brotherton, "What is the Ideal Aerodrome?" and seeing that it will be in the hands of all the municipal officials who will be attending the Conference on November 5, THE AEROPLANE will be doing more good to the Conference than by keeping the Special Issue back to include a report of the Conference.

This Special Issue, be it remembered, will not only go to the 300 or so officials invited to the Conference. It will go to many hundreds of other officials in the British Isles who must, sooner or later, be just as much interested in having their local aerodromes or landing-grounds as their predecessors were in having their local railway-stations. And the Air-Park Issue, with all this valuable information in it, will also be sent to officials holding similar positions in the chief cities and towns of all British Overseas Dominions where air transport is likely to be of use.

The report of the Conference will then be the leading feature of the issue which will follow the Conference itself on November 5.

Judging by the way all the recent Special Issues of THE AEROPLANE have been sold out, in spite of an increase in the number printed which has put our paper bill perilously high, readers of this paper who are not already regular subscribers will be wise to order their copies of the Special Issue (which will be dated October 30) well in advance, as newsagents have an unfortunate habit of ordering only the precise number which have been ordered from them,—thus maintaining fully the habit of enterprise which is so characteristic of the British shopkeeper.—C. G. G.

THE LESSON.

Two recent fatal accidents in the Royal Air Force should be taken to heart as a lesson for all young pilots, whether in the Air Force or out of it. Flg. Off. C. H. Jones of No. 23 Squadron was killed on Aug. 14 at Sutton Bridge, and Flg. Off. John Clarke of No. 29 Squadron was killed on Oct. 11 at Brough. These two had been proved in competition to be the most skilful pilots in the Royal Air Force, which is to say in the World, and yet they were both killed by over-confidence amounting almost to carelessness.

Their deaths are positive proof of the axiom that the cleverest aviator is not the one who is so clever in getting out of tight corners but the one who is too clever ever to get into a tight corner. One has heard the aphorism that if there were no reckless pilots there would be no fighting squadrons. But there is a clear line between daring and recklessness, and between carelessness and over-confidence.

Naturally our fighting-pilots must be daring. But there is a cold and calculating bravery which prolongs life and, besides, makes a man more deadly in battle than the fighter who merely sees red and trusts to his skill to save his own life.

Mr. Jones was one of the pair of pilots chosen in the competition at Northolt to do the representative display of combined aerobatics at the R.A.F. Display at Hendon. Mr. Clarke was one of the pair who were the runners up in that competition, and with his partner also performed at Hendon. What they did not know about flying has not yet been learned by anybody.

The fact should also be noted that in the very competition at Northolt in which they defeated the other Fighter Squadrons, another pilot of almost equal skill was killed also through over-confidence in his ability to control his machine near the ground.

Mr. Jones was killed while starting out for a practice shoot at Sutton Bridge. He and his partner Mr. Purvis were taking off together. The engine of Mr. Jones' machine choked slightly, so instead of taking off he turned on the ground, taxied back to the end of the aerodrome and took off again.

Evidently with the idea of overtaking his partner as quickly as possible, as soon as he was off the ground he pulled his machine round in a sharp turn on an almost vertical bank, only a few feet off the ground, pulled round too tightly, stalled on the turn, slipped down on one wing-tip, touched the ground and went straight in on the nose of the machine, which at once caught fire. If he had let the machine go straight up to about 300 feet, and had then done the same thing, he would not have lost thirty seconds, and he would have had room to recover.

Mr. Clarke, who, as is recorded in a note in the Personal Column this week, had been lent to 29 Squadron for the Displays at Newcastle and Hull, took off in formation with his flight, but with instructions to break away and go direct to Cranwell. As soon as the flight had taken off he turned and circled round the factory at Brough, waving to his friends on the ground as he passed. Instead of allowing himself 50 feet or so over the roof, he cut it fine as is the habit of so many very clever pilots. Unhappily just as he came to the edge of the roof he met a downward bump caused by the curl-over of the wind, and instead of scraping over the roof with ten feet to spare he hit it, carried away part of the roof, and fell with his machine in a heap on the concrete the other side of the shed, where the machine caught fire.

As may be seen from the personal note to which one has referred, John Clarke was the most brilliant officer of his seniority in the Air Force. Not only was he an extraordinarily fine pilot, but he had won high academic distinction and had shown remarkable intellectual qualities. Personally he was one of the most charming young men one could meet. He had the gift not only of attracting people to him by his charm but he was also a born leader of men. If anybody had wanted to prophesy the futures of the young officers of the Air Force he would have picked on John Clarke as a future Chief of the Air Staff.

Nobody could have known better than he did the curious effects of currents over buildings. Many young pilots, accustomed only to high-powered machines which barge their way through anything, might have been excused for disregarding such possibilities. But John Clarke had flown under-powered light aeroplanes as well as high-powered machines and must have known perfectly well the effects of upward and downward currents. Yet, in sheer joy of starting off on a bright morning in a machine with plenty of power he must needs go cutting things fine. And he paid with his life for that momentary carelessness.

Yet the lives of John Clarke and Charles Jones will not have been wasted if only young pilots will learn from them that cleverness in keeping out of tight corners is much more valuable than cleverness in getting out of tight corners.

CELLON

The dope of proved efficiency

Cellon dope is the answer to all conditions at home and abroad. It is equally efficient for bombers, torpedo carrying machines, fighters or interceptors. The H. G. Hawker Engineering Co., Ltd., is only one of many famous manufacturers who standardise Cellon for all machines—whether built for home or foreign service.

Cerric Cellulose Lacquers comply with D.T.D. Specifications for metal parts, cockpits, propellers. Particulars on application.

CELLON, LTD., Upper Ham Road, KINGSTON-ON-THAMES.

THE ROYAL AIR FORCE.

The London Gazette.

October 11.

ROYAL AIR FORCE.

GENERAL DUTIES BRANCH.—The following are granted perm. comns. as Plt. Offs. with effect from Sept. 28, 1929, and with seniority of Sept. 28, 1928:—H. B. Collins, G. C. Holland.

The following are granted S.S. comns. as Plt. Offs. on probation with effect from and with seniority of Sept. 23:—J. A. Nicholson, G. W. Stranraer-Mull, J. S. Tanner. The following Plt. Offs. on probation are confirmed in rank (Sept. 17):—G. D. Hoyland, S. S. Mackay.

The following Plt. Offs. are promoted to the rank of Flg. Off.:—L. E. A. Wright (June 30); J. Beaumont, V. H. Nicolay, R. Chadwick, F. P. Donovan, R. S. Darbyshire (Act. Sub-Lt., R.N.R.), N. X. Sheldrick, R. A. F. W. Williams, F. B. Taylor, M. I. Barnett (Sept. 16).

Air Vice-Marshal Hugh C. T. Dowding, C.B., C.B.G., relinquishes his appointment as Director of Training, Air Ministry (Sept. 7).

Flg. Off. F. M. Denny is seconded for service as Aide-de-Camp to the Governor of Victoria (Sept. 26).

The following are placed on the retired list at their own request:—Flt. Lt. H. A. Anson (Oct. 1); Flg. Off. J. F. Mehigan (Oct. 7). The following Flg. Offs. are transferred to the Reserve, Class A:—M. G. Bircham (Oct. 3); M. Fountain-Barber (Oct. 8). Lt.-Cdr. E. J. S. Knocker, R.N., Flt. Lt., R.A.F., relinquishes his temp. comn. on return to Naval duty (Aug. 9). The S.S. comn. of Plt. Off. on probation D. A. Gowing is terminated on cessation of duty (Oct. 8).

The following Lt.-Cdrs., R.N., Flt. Lts., R.A.F., cease to be attached to the R.A.F. on return to Naval duty (Oct 3):—E. W. Anstice, S. Richardson.

RESERVE OF AIR FORCE OFFICERS.

GENERAL DUTIES BRANCH.—Plt. Off. J. M. Longley is promoted to the rank of Flg. Off. (Oct. 2); Plt. Off. G. C. Holland relinquishes his comn. on appointment to a perm. comn. in the R.A.F. (Sept. 28).

MEDICAL BRANCH.—Flt. Lt. W. Parsons resigns his comn. on appointment to a comn. in the Royal Army Medical Corps (Sept. 11).

AUXILIARY AIR FORCE.

GENERAL DUTIES BRANCH.—No. 603 CITY OF EDINBURGH (BOMBER) SQUADRON.—The following to be Plt. Off.:—T. M. McNeil (July 30).

Fatal Accidents.

The Air Ministry regrets to announce that as the result of a collision in the air at Netheravon between two Atlas machines of No. 1 Flying Training School, Netheravon, on Oct. 10, 351620 L-AC. Thomas White Kelly, the pilot and sole occupant of one of the machines, was killed. Plt. Off. Hugh Dunsmuir Primrose, the pilot and sole occupant of the other machine was dangerously injured.

The Air Ministry regrets to announce that as the result of an accident at Brough, Yorkshire, to a Siskin machine of No. 29 (Fighter) Squadron, North Weald, Essex, on Oct. 11, Flg. Off. John Clarke, the pilot and sole occupant of the aircraft, was killed.

The R.A.F. Display.

The eleventh annual Royal Air Force Display will be held at the R.A.F. Station, Hendon, on Saturday, June 28, 1930.

The Yorkshire Auxiliary Squadron.

A new aerodrome for the accommodation of a Squadron of the Auxiliary Air Force is being constructed at Thornaby in Yorkshire. New sheds, barracks, and technical buildings are being built but the officers' mess will be converted from an old house on the edge of the aerodrome, known as Thornaby Hall. The area of the landing ground will be about 190 acres.

At a meeting of the North Riding Territorial Association at Northallerton on Oct. 10, the General Purposes Committee of the Association stated that they had received a letter from Lord Thomson, Secretary of State for Air, with regard to the raising of a Bomber Squadron of the R.A.F. on a Territorial basis (an Auxiliary Squadron) for Middlesbrough and Thornaby. The Committee felt that it would be desirable to have such a Squadron and recommended its formation to the Association.

Sir Hugh Bell, President of the Association, added that the submission of names of officers had been left to himself and Colonel Wharton, and that a suitable reply would be sent to the Secretary of State for Air.

No. 504 (County of Nottingham) Squadron.

The correct postal address for all correspondence for No. 504 (County of Nottingham) (Bomber) Squadron is Hucknall, Nottingham.

No. 205 (Flying Boat) Squadron.

The Times correspondent in Rangoon in a message dated Oct. 14 states:—

During the monsoon which is now closing the Royal Air Force flying-boats stationed at Singapore have been engaged in trial flights along the route Singapore—Rangoon—Calcutta, to collect meteorological data. The final flight is now being made, and Commander Cave expresses the opinion that there would be no great difficulty in maintaining the flights between Calcutta and Singapore, even during the monsoon. This should encourage the Government of India to forge ahead with the long-delayed equipment of the Calcutta—Rangoon section of the route, which eventually, it is hoped, will extend to Australia.

University Courses.

The following officer of the R.A.F. who was selected for the University Course beginning in October, 1927, has successfully passed the course and obtained the degree of B.A. (Ordinary):—Flt. Lt. H. A. L. Pattison. This officer is now entitled to the classification S*.

The following officer who was selected to attend the course in meteorology beginning in October, 1928, has completed the course satisfactorily, and has been awarded the Certificate for Post-Graduate Work in Meteorology of the Imperial College of Science and Technology:—Flt. Lt. H. F. Bradley. This officer is entitled to the classification "Met."

The R.A.F. Memorial Fund.

A meeting was held on Oct. 9 of the Executive Committee of the R.A.F. Memorial Fund. Sir Charles McLeod, Bart., Chairman and Hon. Treasurer, was in the chair.

Air Marshal Sir Edward Ellington, K.C.B., Air Officer Commanding-in-Chief Air Defence of Great Britain, was elected a Member of the Committee in the place of Air Vice-Marshal F. R. Scarlett, who is going to Egypt to command the Middle East Area.

The Secretary informed the Commitee that the Vanbrugh Castle School maintained by the Fund, opened for the Winter term on Sept. 10 with a full complement of thirty-six boys.

The report of the Grants Sub-Committee who deal with all applications for assistance from past and present members of the Force shows that during the fifteen weeks since the last Meeting the Sub-Committee had dealt with 104 cases and during the same period the Secretary had dealt with 178 cases of a less serious description, in practically all of which cases grants were made by either the Sub-Committee or Secretary.

Regarding the recent anonymous donation to the Fund of £15,000, the Committee were informed of the particulars concerning five officers and ex-officers of the R.A.F. whose children were helped by grants towards education.

The attention of the Committee was drawn to the fact that in accordance with a resolution passed at the beginning of the year, the commemoration of the signing of Peace on Nov. 11, 1918, in respect to the R.A.F. War Memorial on the Victoria Embankment, London, will take place on the morning of Sunday, Nov. 10. Details of the ceremony cannot yet be published.

The Committee authorised the provision of a wreath as usual to be laid at the foot of the Memorial, by, they hoped, Marshal of the R.A.F. Sir Hugh Trenchard, Chief of the Air Staff, and they further sanctioned a grant of money for the provision of a wreath to be laid at the Scottish National War Memorial (R.A.F. Bay) on Edinburgh Rock in celebration of the Armistice.

Dame Helen Gwynne-Vaughan, G.B.E., was unanimously appointed Deputy Chairman of the Executive Committee.

SERVICE SUPPORT.—No. 29 (Fighter) Squadron taking off during the R.A.F. Display at the Hull Municipal Aerodrome. In the foreground is a wing-tip of the Beardmore Inflexible. —(*"Aeroplane" photograph.*)

Fencing.

The R.A.F. Fencing Union defeated the Birmingham Fencing Club at Uxbridge on Oct. 5 in a four-weapon match by 10 defeats to 26. The results were:—

Foil.—R.A.F.F.U.: Sjt. Hancock, no defeat; S-M. Bradbury, 1; Sjt. Digby, 2. Total, 3. Birmingham F.C.: Maj. R. E. Cole, 1 defeat; G. F. Haycraft, 2; T. F. Flint, 3. Total, 6.

Epée.—R.A.F.F.U.: Flt. Lt. G. C. O'Donnell, F-S. Bishop, and Sjt. Stubberfield, 1 defeat each. Total, 3. Birmingham F.C.: V. Clayton Morris, 1 defeat; C. R. Bird, 2; A. P. Fletcher, 3. Total, 6.

Sabre.—R.A.F.F.U.: Hancock, no defeat; Stubberfield and Bradbury, 1 each. Total 2. Birmingham F.C.: Cole, 1 defeat; Haycraft and Bird, 3 each. Total, 7.

Bayonet.—R.A.F.F.U.: S-M. Barber, no defeat; Digby and Cpl. Kinward, 1 each. Total, 2. Birmingham F.C.: Cole, 1 defeat; Morris and Fletcher, 3 each. Total, 7.

The Royal Australian Air Force.

Three Westland Wapitis (Bristol Jupiter engine) of No. 3 Squadron, Royal Australian Air Force, flew from Sydney to Brisbane to take part in the New South Wales Aero Club Pageant, on Aug. 31, a distance of 510 miles, in three hours, twenty minutes.

The formation was led by Flt. Lt. C. T. Anderson, an officer of the R.A.F. who is seconded to the R.A.A.F., with Sjt. Pilot W. Brown as observer. The other pilots and observers were Flt. Lt. Waters and AC. Lamb; Flg. Off. Simms and Cpl. Eddison.

The Wapitis in the R.A.A.F. are fitted with wireless transmitters with a range of 3,000 miles and desert equipment consisting of stores and an eight-gallon tank of water in case of forced-landings in barren country.

PARACHUTE DEVELOPMENTS.

Experimental work is now in progress at the U.S. Army Air Corps Material Division, Wright Field, Dayton, Ohio, on the Irving parachute, which is the standard type in use in the Air Corps. Various improvements and refinements are now being subjected to extensive test and if successful may cause certain changes in the standard type.

Whether eventually adopted or not these changes are interesting, and as this chute is also standard in the R.A.F. these changes are given below for general information.

Materials, area and the principle of operation of the standard chute will remain unchanged.

Instead of the circular mainsail a triangular one has been substituted. This triangle is rounded at two corners, and the third is sheared straight across. The shroud-lines extend down, spaced regularly as in the standard chute, except across the sheared-off corner, which has no shroud-lines whatsoever. When the chute is open, this portion, upon which there are no shroud-lines to pull, forms a tail-like vent through which the air escapes.

Approximately a dozen jumps and a hundred dummy drops have been made with the new chute. These indicate a decreased oscillation and shock load to the jumper upon opening, and greater manual steerability in descent. This improved operation is accomplished mainly by the different shaping of the mainsail.

The air, escaping through the tail-like vent, propels the chute horizontally at a speed of from three to four miles an hour. Because the parachute inherently possesses this horizontal motion, steering can be accomplished by the manipulation of the shroud-lines and the parachute be so turned that the vent is with or against the wind, controlling direction.

The decreased shock to the jumper results from a second round vent at the apex of the mainsail, somewhat different from that of the standard chute. During low shock loads this vent remains closed and at high shock loads automatically opens. The chute has very little oscillation. It may turn in its direction, but there is virtually no swing.

A feature adding to the safety of operation upon opening is a new springless, nonfoulable pilot-parachute. This is 30 inches long and 36 inches in diameter. The lobes have partitions which extend to a long central elongation fastened directly to the apex of the mainsail and making shroud-lines unnecessary. The actuation of the pilot-parachute in the standard chute is supplied by springs. In the new parachute this actuation is achieved by a different method of packing.

The new pack has rounded corners for better wear and to prevent folds of the silk slipping through. As in the standard chute, the shroud-lines are packed in pockets, zigzagged across the bottom of the pack. The mainsail is folded on top.

Two pieces of canvas under great tension from heavy elastics are drawn diagonally across the shroud-lines and mainsail, and are fastened with pins under the outside corners of the pack. The pilot-chute lies above these diagonal pieces and is partially rolled in a fold of canvas attached to the canvas which forms the outside cover of the pack. This cover is drawn, along with the diagonal pieces, under the outside bottom of the pack and secured with the same pins.

When the jumper pulls the rip cord, these pins are snatched out, the diagonal pieces under strong elastic tension draw back sharply, throwing open the top cover and flinging the pilot-chute out into the wind. The edges of the mainsail skirt are snapped to the bottom of the pack with glove fasteners, so that the chute and shroud-lines are strung out before the skirt bottom is released. This prevents bunching of the folds and tangling of the shroud-lines, permitting the chute to fill with air in swift and orderly fashion.

THE CATERPILLAR CLUB.

The total membership of the Caterpillar Club is now approximately 340. During the month ending Sept. 11 thirteen pilots,—including three U.S. Army Air Corps, four R.A.F., one R.C.A.F., and three American civilian pilots,—made emergency parachute jumps. The biggest number ever recorded during one month is fifteen. This was for the month ending July 11, 1929.

One of the U.S. Army Air Corps pilots was Lieut. J. H. Doolittle. He was making a practice flight prior to giving an exhibition at the National Air Races at Cleveland, Ohio, on Sept. 1, when in a dive his wings came off.

When an emergency jump is made serving officers are required to submit an official report to the office of the Chief of the Air Corps. This report has to be made out in narrative form, in reply to eleven questions, and these questions with Lieut. Doolittle's answers are quoted below.

Place, date and time of jump:—Cleveland, Ohio, Sept. 1, 1929, 3.10 p.m.

Type and Air Corps number of aircraft:—P-1C, Prestone-cooled A.C. No. 29,227. P. 537.

Whether or not the aircraft was under control at the time of the jump:—No.

Type of parachute used:—Irvine seat type.

Estimate of engine speed at time of jump:—2,800 r.p.m.

Estimated speed of aircraft at time of jump and its position with relation to flight, i.e., climbing, diving, etc.:—200 m.p.h., 30 degrees past vertical—diving.

Description of method of leaving aircraft:—Thrown out.

A complete and accurate account of the causes for the emergency jump:—Wings broke.

An accurate account of the feelings and reactions of the jumper during and immediately after the jump:—(Space left blank.)

Velocity of surface wind at time of the jump and general weather conditions:—Gusty wind.

What ill-effects or injury was sustained from the jump, if any, state the cause:—None.

U.S. ARMY AIR CORPS ACCIDENTS.

An analysis of the accidents in the U.S. Army Air Corps for the year 1928 show that 85% of pilot fatalities occurred among officers with less than two years' experience.

During the year 46% of the fatalities were for pilots of less than 200 hrs.' flying experience, 17% had from 200 to 500 hrs.' flying, 25% from 500 to 1,000 hrs.' and 12% from 1,000 to 1,200 hrs.' experience.

Of fatal accidents 63% were due to pilots' errors, of which 24% were due to errors of judgment, 30% to poor technique, 3% to disobedience of orders and 6% to carelessness or negligence.

THE RANGE OF AIRCRAFT.

The first lecture of the Winter Session of the Royal Aeronautical Society was held at the Royal Society of Arts, John Street, when Mr. C. R. Fairey read a paper on the Range of Aircraft. There was a very large attendance, and late arrivals had some difficulty in finding seats.

MR. FAIREY opened the lecture by pointing out that, although the useful load and speed of aircraft might for ever be increased, when once the range had been raised to 12,000 miles the designer need go no further, for this was the greatest distance between any two points on the earth's surface.

In the early days the duration of a flight simply depended on the engine and the time that this could be persuaded to keep going. The first official record of 220 metres was not recorded until 1906.

The lecturer then showed a number of slides illustrating the whole sequence of record-making machines, including the Bréguêt XIX, "Bidon," on which Costes and Bellonte have recently probably beaten the distance record.

At this point a graph of the speeds and distances was shown—and the way the two lines ran parallel was remarkable. Two other points were also very marked, one that the War years were a time of slow development, and the other that the rate of increase both for speed and range has been very much greater during the last six or seven years.

The lecturer said that the need for long-range aircraft is obvious, and, from a military point of view, with Service aircraft as they now are, a belt of ocean 600 miles wide is enough to protect a country from enemy action. As regards civil operations, the British Empire appears to demand a machine with reasonable paying load and range of 2,000 miles. Such a machine could fly to India in 60 hours, with only three stops—Malta, Baghdad, and Karachi.

The slides of the record-breaking aircraft included some interesting photographs of the Fairey Long-Range Monoplane, showing the tanks before they were placed in the machine and also in position in the wings.

Mr. Fairey thought that there were probably three reasons for the success of the recent long flight of the Bréguêt, which has probably beaten the World's Record. The first of these was that there was a following wind. The second, that there were nearly 2,000 yards of good take-off surface at Le Bourget with a downward gradient. Thirdly, the low consumption obtained with the new 600 Hispano-Suiza engine. Faireys had one of these engines to test for Vickers, and found that the six carburettors gave specially good distribution. There was no reason why Hispanos should not tune their carburettors as well as Napiers tuned theirs, and such tuning, with the remarkably good distribution, would result in a very low fuel consumption.

Every aeroplane, he said, has a certain speed in relation to its load at which the range is a maximum, and to reduce or increase that speed will affect the range adversely. The most economical speed is dependent upon relative parasitic and induced drag—that is, the drag due to structural excrescences and the drag produced solely as one of the component forces acting on the wing. This economical speed is also dependent upon the wing-loading, the efficiency of the airscrew, and the manner in which the fuel consumption varies with the power used for cruising.

Mr. Fairey showed a graph from which the learned (and the sharp-sighted, for the writer was not able to distinguish any figures) could perceive that, generally speaking, increasing the wing-loading increased this economical speed, though take-off requirements limited the permissible increase.

Mr. Fairey now began to talk about his Long-Range Monoplane, which recently flew non-stop to India from England, and in the very near future will again attempt to win the World's Duration Record.

In considering a design for this type, the first points to be decided are the actual load to be carried, the type of engine, and the load factors. Putting the last first, the necessity for low proportionate structure weight is so great that careful handling must be presumed, and a limit must be put on the maximum speed, all of which will allow fairly small factors to be used.

The engine chosen was a standard Napier Lion with a 7-to-1 compression ratio. Special carburettors were fitted to improve the fuel consumption within the required throttle range.

The load to be carried consisted of the crew, their instruments, emergency equipment for a forced landing, and food, all of which totalled about 800lb. The fuel carried had to be enough for 5,500 miles. Actually the fully loaded weight of the machine was 17,000lb.

The pilots were enclosed to save the resistance of open cockpits and to protect them from the fatigue of facing the wind-pressure and draughts for so long a period. The small lamp-lit cabin gave the pilots a most unexpected sense of security and isolation from external conditions when flying by night over Eastern Europe, close to high mountains and in bad weather.

Questions of power-loading and also that of wing-loading affected the choice of the all-up weight—for runways a mile long are difficult to find in England, and the rate of climb required in the first few hours keeps down the loading.

At this stage in the process of considering designs, the monoplane and the biplane were equal favourites. The monoplane was finally chosen because of the scope for obtaining high lift-to-drag ratios. The cantilever wing was selected because of the facilities it offered for the stowage of fuel, and this wing was placed above the fuselage so as to obtain a gravity feed. The single-engine type was used because of its low drag.

Talking of drag, calculations showed the amazing fact that if it were possible to discard the under-carriage the range would be increased by 1,000 miles, so large a quantity of energy is required to force the undercarriage through the air.

Mr. Fairey then gave a rough outline of the construction of his machine. The wing is of tapered and twisted form. Its span is 82ft., and the aspect-ratio 7 to 1. It has wooden spars and a pyramid form of internal bracing of steel tubes. The fuselage is a conventional Fairey welded-tube structure. The cantilever tail is built similarly to the main plane. The only external bracing on the machine is that of the tie-rods which anchor the fin to the tailplane.

The wheels are fitted with special roller-bearings to help the take-off.

A single set of controls is provided, and the cabin is arranged to make changing-over easy. The member of the crew not acting as pilot can move about in an upright position, and can also lie down. Special windows were put in for navigating purposes. And care was taken to ensure adequate ventilation, so that the crew should suffer no ill-effects from exhaust-fumes.

The fuel, nearly half of which can be jettisoned in emergency, is carried in the wings, as is also the oil and water. The total fuel capacity is 1,157 gallons. The oil system, external to the engine, is duplicated so that filters may be cleaned in the air.

Most of the instruments are in duplicate. Ordinary magnetic compasses are used. The special instruments fitted are the latest Farnborough-type flow-meter, turn-indicator, and statoscope, with a special apparatus to give audible warning of any rapid change of flight.

ARRIVED.—The Fairey Long-range Monoplane (Napier Lion) arriving at Karachi, after having flown non-stop from Cranwell.

Digitized by Google

By specially tuning the carburettors, the engine-makers succeeded in reducing the fuel consumption by an average of 13 per cent. This figure is half-way between that obtained with the standard service engine and the best theoretical result.

Everybody's hopes were raised by the fine results obtained from take-off tests with steadily increasing loads, until the frozen ground was found to be responsible for the very good results.

During these tests, and after the discovery of the uphill gradient, some effort was made to determine the friction co-efficent with varying types of ground. These tests consisted of running a loaded motor-car at a fixed speed, shutting off the power, and seeing how long the car travelled before it stopped. An ordinary level tarmac road was taken as 1. Good dry aerodrome surface was 78 per cent., rough ground with tufted grass surface reached as low a value as 23 per cent., and the effect of rain or any softening of the surface made matters very much worse. After this, attempts were made by burning grass and rolling to improve the surface.

When the Long-Range Monoplane finally took off on her attempt with Sq.-Ldr. A. G. Jones-Williams, M.C., and Flt.-Lt. N. H. Jenkins, O.B.E., D.F.C., D.S.M., on April 24, 1929, she was carrying 1,043 gallons of fuel (or 7,620lb.). This amount was sufficient for 4,800 miles which was 340 miles further than the existing record. The machine took off with a run of 1,235 yards, and in the first 15 minutes had climbed to well over 2,000ft. The Long-Range Monoplane landed at Karachi 50 hours 37 minutes after leaving Cranwell, having covered a distance of about 4,290 miles. The Great Circle distance was 3,950 miles. Eighty-two gallons of fuel were left.

The engine, which gave full-horse-power at the take-off, was throttled back to 420 b.h.p., and thence by stages to a minimum of 210 h.p. The average fuel consumption was 0.46lb. per h.p. hour, equivalent to 4.4 miles per gallon on the distance flown.

The Society applauded loudly when Mr. Fairey commented on the fact that, in spite of all their difficulties, the crew kept a continuous log hour by hour.

Mr. Fairey said that if the Long-Range Monoplane could be made to fulfil the conditions of Professor Jones's ideal streamline aeroplane, that is, that the total resistance consisted only of the induced drag and that due to skin friction, then, if the same engine were used, the machine would have a range of 8,500 miles.

The discrepancy between the achieved results and the ideal, he said, was mostly due to the turbulence produced by the chassis and radiator, which account respectively for one-half and one-quarter of the total parasitic drag of the whole machine. If the radiator resistance could be eliminated, the range would be increased to 6,000 miles, while the discarding of the chassis, or making it entirely retractable, would increase the range to 7,200 miles.

If an engine of 1,800 h.p. of the same weight-to-power ratio and of equal efficiency to the Lion were available, without any higher aerodynamical efficiency, a flight of 8,700 miles should be possible.

Mr. Fairey pointed out that the most obvious line of improvement lies in the development of the power plant, and in the production of a carburettor and induction system to give a lower fuel consumption, or even to extend the present minimum over a larger part of the throttle range. Modern carburettors give their lowest fuel consumption usually from three-quarters to full throttle. For the purpose of a long flight, full throttle is only used at the take-off, the throttle being progressively closed to about one-third full power.

The Napier Company by specially tuning the standard engine were able to lower the consumption to 0.43lb./h.p. hour, and this was obtainable from full throttle to about two-thirds full power. If this minimum figure could be extended down to one-quarter full power, the range of the Fairey Long-Range Monoplane would be increased to 6,000 miles.

The possibility of using higher compression-ratios and non-detonating fuels, coupled with the possible improvement in carburation, makes a range of 8,600 miles feasible without any improvement in the aircraft.

Such a machine used for a range of 2,000 miles (which is the ideal distance for the British Empire) could carry 5,000lb. If, under these conditions, the engine of 1,800 h.p. mentioned above were used, a total range of 10,000 miles would be available. More importantly such a machine would carry a useful load of 20,000lb. for a range of 2,000 miles.

The oil-burning compression-ignition engine appears to have possibilities in spite of its increased structure weight, which, however, is of no significance, if balanced by fuel consumption of 0.32lb. per b.h.p. An engine of this type, with this consumption, and weighing not more than 3lb. per h.p., and with an output of at least 1,800 h.p., would increase the range of a machine far above any distances mentioned in the lecture.

After the paper had been concluded, the short official R.A.F. film of the attempt was shown. This included a very good picture of the take-off.

The Discussion.

Colonel Sempill, the Chairman, made some appreciative remarks about Mr. Fairey, and then called on Mr. Farren as the champion of the biplane to launch the discussion on the monoplane.

Mr. Farren congratulated Mr. Fairey on his entertaining lecture and on transporting his audience (by means of the film) to India and back in ten minutes. He refused to be drawn into the controversy of how much better the monoplane would have been as a biplane. He did mention, however, that the Bréguêt biplane had probably broken the Record.

He wondered whether we were entitled to ask people to make these dangerous attempts. As this was the first occasion since the events, he congratulated the crew of the monoplane, and those responsible for the success at Cowes, on behalf of the Society. He thought that the attendant advertisement was the best result of these attempts.

Long-range machines were of no value commercially, as the characteristic of such machines was their low average speed. The Fairey machine averaged 80 m.p.h. to India. Speed was the great commercial requirement, and 500 miles was the limit of the passenger's endurance. [Surely only if a speed of 100 m.p.h. be assumed.—Ed.]

The Chairman then called upon Mr. Handley Page, and said it

THE BIDON.—The Bréguêt biplane (Hispano-Suiza) in which MM. Costes and Bellonte are alleged to have flown non-stop from Paris to within 200 miles of the Pacific Coast of Manchuria.

Digitized by Google

was the first time the Society had had a chance of congratulating him in his new rôle of Chairman of the S.B.A.C.

Mr. Handley Page, after a humorous reference to the poverty of the S.B.A.C., which prevented him from appearing in a chain, or robe of office, said that he agreed with Mr. Farren as to the value of the advertisement gained from such attempts, but disagreed that such machines had no commercial application. Such attempts resulted in improvements to both aircraft and engines.

He had frequently found discrepancies between the consumption figures obtained by the makers on the test-bed and those obtained from the same engine in the air. Perhaps the engine became contaminated by its surroundings. Mr. Fairey had shown what a big increase in range could be obtained by a decrease in consumption which was theoretically obtainable. He thought these long ranges of 5,000 miles were more suitable for the transport of mail than passengers. He wondered whether Mr. Fairey would give more detailed figures for weights and loadings.

Mr. Chorlton thought that the heavy-oil compression-ignition engine with the low consumption mentioned would soon be available. He referred to the simpler cooling-circuits of the evaporation type available with this class of engine. He said that one of the difficulties in the way of good consumption figures was getting the correct results from injection at high average M.E.P.

Captain Barnwell agreed that long-range machines were worth while. He commented on the choice of a monoplane with a water-cooled engine when a biplane with an air-cooled engine was available. He thought that the drag required to cool an air-cooled engine could be reduced to a considerably lower figure than that required to cool a water-cooled type. Like Mr. Handley Page, he would be glad to have more figures. With regard to the 800lb. useful load, if the weight of the pilots were deducted, about 440lb. was left for instruments and equipment, surely this was a rather big figure.

Captain Bell said that the lecturer had indicated possible improvements open to engine designers. He referred to the advantages of evaporative-cooling and the possibility of using a super-charger at take-off. In making the comparison between the water- and air-cooled types, did Mr. Fairey assume the same fuel consumption for each type? In view of the enormous consumption of power by dynamos in the slipstream, why could these not be engine-driven?

Mr. MacKinnon Wood said he would like to have weights, and especially structure-weights. He also asked why wing-surface radiators had not been used. While engaged on work in connection with increases of span, he had been surprised to find that if the aspect-ratio were increased to an unconventional degree, the ceiling was considerably increased.

Mr. Jennings said the range of a biplane with an all-up weight of, say, 9,000lb., could be considerably increased by stepping-up the aspect ratio from 7.5 to 12.5, even making allowance for an increase of weight and parasitic drag. He also stressed the advantages of flying as high as possible.

Major F. M. Green wondered why Mr. Fairey had passed over the air-cooled engine. If one replaced the weight of the radiator and its water with an equivalent weight of fuel, and used the Townend Ring to reduce the drag of the air-cooled engine, he thought that the range with the two types should be about the same. He would like to ask whether the carburettors were fitted with a special altitude control.

The Chairman then called upon Sq. Ldr. Jones-Williams and Flt. Lt. Jenkins to speak.

Sq. Ldr. Jones-Williams, who was greeted with much applause, referred to the very few alterations which they had found to be necessary. The thing that they needed most was a little more comfort. They had found their arms a nuisance, and there was nowhere to park them. Next time they were going to sling them from the roof. [Presumably lethal weapons, not those used for embraces.—Ed.] There was also some difficulty in fitting both himself and Lieutenant Jenkins to the same seat. [There is a large difference in build between these two.—Ed.] They were going to change the type of turn indicator used. They took far too much food with them. He suggested that Lieutenant Jenkins should talk about the instruments.

Flt. Lt. Jenkins, who was also much applauded, confessed that he was unable to understand Sq. Ldr. Jones-Williams' reluctance to speak upon navigation instruments, as he had only just returned from a navigation course. For the forthcoming attempt they were going to use a new form of Drift Calculator, which should give them very much better results than the instrument they used on the first effort.

The Reply.

Mr. Fairey, in his reply, referred to Mr. Farren's very sporting refusal to join issue over the monoplane-versus-biplane controversy when the biplane had it all its own way with the victory of the Bréguet. He thought that the Atlantic crossing would become an absolute necessity, and this, therefore, made a range of 2,000 miles essential.

He had recently asked Mr. C. M. Keys what was the matter with European Aviation, and the great American Air Mail Operator said "Passports." This was why Mr. Fairey wanted to fly to India in three hops and have long-range machines

Replying to Mr. Handley Page, he was happy to say that he had the Air Ministry's permission to publish the figures relating to the Long-Range machine. He calculated that had he fitted H.P. Slots to the machine there would have been 88 infringements of the patent rights *en route*.

In choosing the water-cooled engine, he had only regarded the problem from the point of view of head resistance. As a retractable radiator was used, the drag of this was proportional to the power. He had not considered using the Townend Ring.

Although they found when considering monoplane versus biplane that the structure weight of the monoplane wing was six per cent. higher than that for the biplane, they had decided on the monoplane because the fuel could be stowed in the wings. The monoplane had been tried out in the wind-tunnel for high and low-wing positions, and although the low wing gave slightly better results, they had chosen the high position because they could then use gravity feed. The varying cooling surface required made the use of wing radiators impossible.

There was no difficulty in driving dynamos directly from the engine. As long ago as 1913, when he was with Shorts, they had driven their wireless dynamos off the engine.

Biplanes of very high aspect-ratio required exceptionally long tie-rods, and these were troublesome. It was good strategy to climb slowly, and the crew had instructions to this effect. The machine's ceiling at take-off was only 3,000 feet. In this connection there was the tragedy of the following wind down the Persian Gulf at considerably less altitude than that at which the machine was travelling. [In spite of this, nobody suggested the advantage of carrying wireless, even a light-weight receiving set.—Ed.] The carburettors were fitted with special altitude controls.

THE LECTURER.—A sketch of Mr. C. R. Fairey made by the Bolshevik artist, Efimoff, at a dinner given by Mr. Fairey to the crew of the "Wings of the Soviet," when in this country. The picture has not as yet interrupted diplomatic negotiations with the U.S.S.R.

ROUND EUROPE.

Between Sept. 13 and Sept. 22 Sous-Lieut. Sahuc and Commandant Labaurie in a Potez 25 (500 h.p. Salmson engine) flew round Europe over the circuit—Paris—Oslo—Moscow — Constantinople — Tunis — Lisbon — Paris. This makes a total distance of 11,000 kms. (approx. 7,000 miles), and was covered in six flying days.

On Sept. 13 they flew non-stop from Paris to Oslo in 7 hrs. 35 mins. at an average speed of 125 m.p.h. Here they were delayed for two days owing to fog.

On Sept. 16 they flew from Oslo to Moscow non-stop in 8 hrs. 20 mins., at an average speed of over 125 m.p.h.

On Sept. 17 they flew non-stop to Constantinople in 10 hours. While the machine was being man-handled on the ground for refuelling the airscrew was damaged, which necessitated a delay of three days.

On Sept. 20 they flew from Constantinople to Tunis in 10 hours without a stop.

On Sept. 21 they flew to Lisbon, stopping at Oran en route.

On Sept. 22 they left Lisbon to fly direct to Le Bourget, but a strong head wind forced them to land at Bordeaux to refuel. They arrived at Le Bourget at 16.40 hours.

THE LAUNCH OF R.101.

The launching date of the R.101 was originally fixed for Monday, Oct. 7. In the darkness of Monday morning one took advantage of the absence of traffic on the Great North Road and reached Cardington in time to find a gentle breeze at sunrise and a notice postponing the launch to Wednesday.

Wednesday morning gave equally blank results, but a glimmer of hope was provided by a notice which announced that the launch was postponed until 10.00 hours. At 10.20 hours the notice was again changed to 05.15 hours for the following morning.

On Thursday, at the absurdly early hour of 03.15 hours one prepared to make another start. The weather appeared to be magnificent, but caution suggested a telephone inquiry. When the sleepy telephone operator put one through to Cardington the surprising news that no launch would be attempted that day was vouchsafed.

By this time the daily Press were beginning to get restive, and prominent articles by correspondents, who had obviously allowed their pens to come under the influence of three successive super-early morning rises, demanded to know the use of a ship that could not be launched into a 9 m.p.h. wind.

The launch of an airship from its shed may be regarded as analogous to the launch of a ship from a dockyard slipway. Once an airship has left its shed it need not go back until major repairs or a complete overhaul are necessary, in the same way that a ship, once it has left the dockyard, only goes into a dry dock at definite periods. But between the launch of an airship and of a sea ship there is a very big difference.

The slipways of a shipyard give approach to a sheltered river, where the only factor to be considered is the tide,—which is remarkably regular in its habits. The ship is only partly finished and is controlled by a battery of tugs which nurse it safely until it comes to rest under the cranes which will finish the construction.

An airship, on the contrary, has to be launched into the free ocean of the air, which is notoriously irregular in its behaviour. The airship must proceed directly from the shelter of the shed to the open element ready to brave any storm which may arise.

If steamships had to be launched at Land's End and proceed direct to moorings off the Scilly Isles past the Longships reef and the Bishop Rock there would be many delays until the Atlantic was sufficiently calm to allow such a procedure.

This may sound far-fetched, but it is not so absurd. To the airship the No. 2 hangar at Cardington is a dangerous reef, and even the mooring tower is a source of danger until the handling lines are made fast to the winches.

A nine-mile an hour wind broadside on to R.101 would produce a pressure of about 4 tons. This is a considerable load to handle when it is realised that the centre of pressure is some 80 ft. above the ground. And the operation becomes increasingly delicate when one considers that there are only a couple of feet to spare above and on each side of the ship when passing through the door.

A careful examination of the difficulties associated with the launching of a large ship directly into the ocean, whether of air or water, will in some measure compensate the annoyance of those who have driven many miles in the night to see the launch at Cardington at dawn.

For the fourth time last week the alarm clock was set to 03.00 hours, and soon after that hour one was "cruising at forty" on the North Road. This time not only had the warning been given that the launch would take place, but the weather promised to be perfect. There was just enough breeze to dispel the patches of fog which lay in the valleys, and there was every evidence that it would be one of those perfectly calm sunrises that the aeroplane pioneers welcomed so gladly in the days of 1909-1911. Indeed, it seems that airships are as weather-shy in 1929 as aeroplanes were in 1909.

The shed doors were open by 05.15 hours, but a faint glow in the eastern sky showed that the perfect calm which seemed so certain a few hours earlier would not be available. The writer reached the Press enclosure to find that the enclosure was little more than a name and that one might wander freely over the aerodrome provided that one did not get in the way. This absence of red tape was very welcome.

At 05.48 hours on Oct. 12, 1929, the several-years-overdue 5,000,000 cu. ft. airship began to move. The wind was about 4 m.p.h. on the ground and 15 m.p.h. at 200 ft. in a direction slightly west of the axis of the shed.

Three white lines were painted on the grass, one each side of the track to be followed, for the handling parties, and one in the middle. Two white bags hung from the hull, one fore, and one aft, to act as pointers, and as the ship

AT THE MAST.—R.101 safely moored. Below are seen the sheds which house the winding-engine for the mooring-cable.

Digitized by Google

was walked out these pointers were kept exactly on the centre line.

At 05.54 hours the ship was clear of the shed and was allowed to swing to the wind. She was then "walked" across the aerodrome with the hull lying head to wind all the time. This meant that her progress was entirely crabwise. Hence one may conclude that a rigid airship not only resembles a crab in having a rigid shell and a soft inside, but it also resembles the crab in the way it walks (at any rate under the conditions of wind at 90° to the path to the mooring tower). By the time the sun had risen she was in a position about one length to leeward of the tower, and the task of attaching the cables was begun.

The operation of mooring was described in THE AEROPLANE last week.

When the ropes were all in order and had been tested by tightening and slacking to see that they ran freely the ship was allowed to rise about 20 or 30 ft. above the ground.

Now came a long wait, everything was obviously ready, but nothing happened. At 07.00 hours the signal was given, ballast was dropped, and the ship rose on an even keel at possibly 50 ft. per minute. The three cables to the nose of the ship held her in position and were slacked off as water-ballast was dropped from a port forward of the front engines.

In a few minutes the ship was at a height of about 400 ft. exactly over the place she had been taken to about three-quarters of an hour before. Another signal was given and the ship was pulled slowly and steadily down to the tower, the cone entered the cup and she was riding at her moorings in a wind of about 20 miles per hour at 200 ft. The whole process was complete at 07.20 hours. The actual time taken was 1½ hours, but there were long waits, and it seemed obvious that everything was being done to a time-table that could have been shortened to half the time.

The ship was held horizontal by the elevator flaps which were at about 20° negative angle when the ship was finally moored. This appeared to be the angle required to counteract the buoyancy due to the 200 ft. that the ship had been hauled down by the nose. It appeared to be a rather large angle for a change in altitude of about 200 ft., though as the sun was now giving some heat there may have been some expansion to allow for.

On Oct. 13 tests were made at the mooring mast. The airship, which was moored by three cables, was allowed to rise to about 500 ft. and then tested for elevator controls, ballast, and trimming. The engines were run and preliminary tests made for the first flight.

On Oct. 14 at 10.30 hours the engines were started in turn and warmed up. Each engine started very quickly, after the gear was engaged, and ran without much smoke.

The ship was moored by the spindle at the nose and by ropes from the rear to three water-ballasted rollers. At 11.00 hours the ropes to the rollers were cast off and at the same time three men climbed outside the top of the mooring tower and stood-by to withdraw the locking pins.

The two engines amidships were then started. Then there came a wait while water was being pumped on board to fill the ballast tanks. This continued until the elevators were returned to the neutral position. A signal was given by the telegraph to the mooring cabin, the waterpipe was disconnected, and then the three men unscrewed the locking pins.

All was now clear, some ballast was dropped and the signal was given for the cable to be slipped.

At 11.20 hours the nose of the ship rose quickly a few feet,

KEEPING HER TAIL DOWN.—The water-ballasted rollers, which hold the ship down and are free to follow her horizontal movements as she swings round a circle with the wind.

OUT AT LAST.—R.101 early on the morning of her first appearance,—Oct. 12.

showing the short end of the cable which had been the final link which held her down.

Then as she drifted back she rose on an even keel, the two engines were speeded up and the ship started on her first flight.

The wind was about 15 m.p.h. at ground level and 30 m.p.h. at 2,000 ft.

The ship sailed away at a fair speed directly against the wind, slowly rising to about 1,500 ft. She made a wide sweep of 15 or 20 miles radius, returning to pass over the aerodrome, and then left, flying in the direction of London.

Every event from the time the ship started to leave the shed on Saturday morning till she left to fly over London happened without incident and was exactly to plan.

The R.101 left Cardington at 11.20 hrs. and was moored again to her mast by 16.50 hrs. During this period she covered something like 200 miles with a crew of 38, and 14 passengers.

Only three out of the available four engines were used and these engines running at cruising speed (500 h.p. each) gave the ship an airspeed of about 58 m.p.h. For some reason the fourth engine was not started. The fifth engine (the forward port power-egg) can only be used for going astern and was so employed when mooring. [This strikes one as being about the silliest single point in airship design that has happened since airships first floated. Has nobody ever heard of a reversing gear?—C. G. G.]

The Air Member for Supply and Research, Air Marshal Sir John Higgins, was on board. The other passengers were:—

Squadron Leader R. B. B. Colmore, Deputy Director of Airship Development, Lieutenant-Colonel V. C. Richmond, the chief designer, Squadron Leader Rope, his principal assistant, Wing Commander Cave-Browne-Cave, in charge of machinery, Mr. Fitzgerald, Mr. Leech, Mr. Giblett, in charge Airship Meteorological Division, Lieutenant-Commander Watt, Flt. Lt. Durrant, wireless experimental officer, Mr. Wells, Mr. Collins, Squadron Leader Booth, captain of the R.100, and Air Commodore Fellowes, formerly Director of Airship Development and now Director of Personal Services, Air Ministry.

THE R.100.

The airship R.100 has been completed and filled with gas and tested. But she will not be ready to leave her shed for three or four weeks, as there is a good deal of detail work still to be done,—chiefly because of minor alterations which have been suggested at various times during the past year or so.

THE RIVAL FIRM.

The *Graf Zeppelin* returned to Friedrichshafen on Oct. 13 after a tour over Holland. During this cruise the Zeppelin flew over Amsterdam and Rotterdam.

THE "GRAF ZEPPELIN" AND THE NORTH POLE.

Much has been broadcast about the projected flights of the *Graf Zeppelin* to the North Pole on behalf of the German Arktis Society.

The Zeppelin management have asked the *Graf's* crew their opinion on the projected flight and have received a reply in writing which states that for financial and technical reasons, the entire crew would refuse to undertake the trip.

So the Zeppelin will not run the risk of undergoing the *Italia's* fate in the Frozen North.

Which reminds one of the historical question of Major Eustace Moyes to Commander Boothby, when he was entreated to take part in a projected trip to the Pole in a Parseval,—"But my dear Boothby, why *should* we go to the North Pole? It's frightfully cold,—and, besides, we don't know a *soul* there."

AIRSHIP DEVELOPMENT.

On Oct. 8 the Airship Development Company Ltd. showed, at a small private theatre in Denman Street, by the courtesy of the Gaumont Co., a film of the launch of the A.D.1.

The film was quite short and as the theatre was very small, the film was shown two or three times, so that every one might see it. The theatre would only hold a few at a time, and there was a considerable overflow.

The object of the demonstration was to afford foreign air attachés a chance of witnessing the airship's performance and to allow various representatives of advertising specialists a chance of seeing this new medium for publicity at work.

The party then adjourned to the Piccadilly Hotel for refreshment, and a general discussion of airship topics.

The A.D.1 is a non-rigid airship with a length of 137 ft. 9 in. and a maximum diameter of 29 ft. The capacity of the envelope is 60,000 cub. ft. The gross lift is 4,250 lbs. and the disposable load 1,500 lbs. The pay load for a range of 500 miles is 550 lbs. The ceiling under this condition is 5,000 ft. Maximum speed is 50 m.p.h. with a cruising speed of 35 m.p.h.

The nacelle, gondola, or fuselage is slung under the envelope by a system of ropes attached to patches on the envelope.

The crew of two sit in tandem cockpits behind the tractor airscrew which is driven by a 75 h.p. A.B.C. Hornet four-cylinder horizontally-opposed air-cooled engine.

THE FRENCH AIR ESTIMATES.

According to the Paris correspondent of *The Times*, the Finance Committee of the Chamber has been considering the credits asked for by M. Laurent Eynac, the French Air Minister, in the Air Estimates,—which allowed for a total expenditure of £16,000,000.

The Finance Committee has considerably curtailed these credits but has decided to recommend the expenditure of £40,000 for a Light Aeroplane Competition, and to encourage the purchase of private aircraft. A further recommendation is the expenditure of £40,000 on the establishment of a National Aircraft Factory, which would stand in the same relation to the Air Ministry as the National Arsenals to the Ministeries of War and Marine. [Considering that we spend £400,000 a year on our National Aircraft Factory (the R.A.E.) at Farnborough, and get practically nothing of value out of it, the French Aircraft Industry need not be alarmed at the competition of a mere £40,000 factory,—C. G. G.]

The Committee has reduced the amount for subsidies to operating companies by over £70,000. The total figure for subsidies as now approved by the Committee is £1,600,000. M. Laurent Eynac proposed to start a new air-line to Venezuela by way of the Antilles and Guiana, but the Committee thought that the air-lines from France to Indo-China and the Congo should be organised first.

Another of M. Laurent Eynac's schemes was to concentrate the production of aircraft in the hands of a few large firms. The smaller firms would supply components and suggest minor improvements. The credit for this purpose was cut by £80,000. The provision made for the mass-production of aircraft was reduced by the large amount of £288,000.

A TOUR OF INSPECTION.

M. Laurent-Eynac, the French Air Minister, has left Paris for Morocco, where he will inspect air units. He will visit Rabat, Casablanca, Marrakesh, Fez, Taza, and Meknes.

A GLIMPSE OF THE NOT-SO-OBVIOUS.

A correspondent writes as follows:—

In your article to-day 2/10/29, page 842, you quote American Commercial Aircraft cruising at 150 miles without cowling and 175 miles with cowling. On pages 858, 859 you quote various American Fighters' performance-figures' top speed (in order of pictures) 165 to 136 miles per hour. Therefore I suppose the position has arisen that these *wonderful* commercial craft with loads of mail are faster than service fighters, with, I suppose, mostly the same engines.

The explanation is quite simple. The American mail-carriers are built for speed. The fuselages are stream-lined off to the last rivet-head. Nothing is allowed to stick out anywhere. And they are not frightfully heavily loaded.

The war machines on the other hand have bomb-racks, and probably bomb-sights. If they have not brackets for machine-guns outside the fuselages, they have at any rate tunnels along the sides of the fuselages for the machine-guns, and generally they have bulges where the machine-gun is fitted into the fuselage. Also they carry wireless gear and all sorts of other gadgets, so that actually they are loaded more heavily than the mail-carriers and have far more things sticking out of them.

The difference is very largely analogous to the difference between a high-speed Atlantic liner and a battleship, or between a touring-car and an armoured vehicle. Anybody who looks at the photograph of even the best American fighter machines and that of a Lockheed, will see at once that the Lockheed must be miles an hour faster.

In this country a similar position has not yet happened, because we have quite a number of new fighters which are highly efficient and actually do well over 200 m.p.h., whereas we have practically no commercial machines at all which have any performance worth mentioning. That was why Mr. Barnard had to buy a Fokker to take the Duchess of Bedford to India and back, and the fact that he did it with a Bristol Jupiter engine merely shows that our engines are more advanced than our aircraft.—C. G. G.

THE SOVIET FLIGHT TO AMERICA.

On Aug. 8 of this year an A.N.T.-4 monoplane left Moscow in an attempt to fly to New York. The machine had a forced landing at Taiga, near Chita (Outer Mongolia), and was so damaged as to prevent the continuation of the attempt.

A second machine named *Land of the Soviets* started a few weeks later and by Oct. 3 had reached Sitka, Alaska, after successfully crossing the north end of the Pacific by way of the Aleutian Islands.

The *Land of the Soviets*, which is believed to be a twin-engined all-metal A.N.T.-4, took off on Oct. 3 for Seattle in the United States and arrived there on Oct. 14 after having been held up by a forced landing in Alaska. After flying across the United States, the crew intend to attempt to fly the Atlantic, to return to Moscow, and thus complete a flight round the World.

PALMER

AIRCRAFT BRAKES

Every flying man should know the advantages of the braking system introduced by the makers of PALMER LANDING WHEELS AND TYRES.

We offer them, and all interested in the construction of aeroplanes, a free copy of a handsome brochure. It contains full information about PALMER AIRCRAFT BRAKES, together with photographs and technical drawings that make the working of the various parts quite clear.

Wherever they are tried, on whatever type of machine, PALMER BRAKES are praised as the solution of numerous problems connected with taking off or landing in confined spaces. In lightness, efficiency and ease of operation they are pronounced ideal.

PALMER AIRCRAFT BRAKES ARE A BRITISH INVENTION OF BRITISH MANUFACTURE.

THE LIGHT AEROPLANE AND THE FLYING CLUBS.

A SATURDAY AFTERNOON AT HESTON.

Last Saturday, Oct. 12, was fine and quite warm. There was hardly any wind and bumps were unlikely. Why not take the rest of the family along to the Air-Park at Heston and make them airminded. This latter term is becoming somewhat of a cliché and also conveys to some people the idea of mental vacuity.

Anyway, *revenant à nos avions* the idea of tea at Heston was passed *nem. con.* and thither a crowd of four proceeded in the editorial Flint, which, for the benefit of the uninformed, may be described as a large and powerful American car of uncertain humour.

We did not take long to get to Heston, where the party disembarked, just in time to witness the *X*-to-the-power-of-10th descent of Mr. Tranum, who apparently only tolerates transport in any aircraft long enough to reach a height of say 1,200 feet,—which is his usual stepping-off height.

This particular descent was quite out of the rut, as Mr. Tranum stepped into space exactly overhead and could be seen falling an appreciable way right on top of us. When he opened his Russell parachute the slight wind carried him into the aerodrome a few hundred yards from the concrete apron where Society was, for the moment, focussed.

On this occasion, as on many others, Mr. Tranum was using his own parachute, which has quite a rapid rate of descent,—the standard Russell is considerably slower.

After this there was time to look around and see the imposing array of aircraft drawn up round the concrete. Mostly Moths, including the all-metal variety and the new coupé Moth of Mr. Norman. This array rapidly dispersed, as after the parachuting and a spot of tea, various people shot away into the everywhere, whence they had come.

Inside the concrete hangar could be seen a lot more machines, and an international gathering at that. This structure, which may be regarded as the prototype of the new style of Air-Park architecture, uses bold arches for its expression and reinforced concrete for its medium. There were, beside the British machines, a Fiat AS-1, a two-seat Romeo Ro.5, the Avia B.H.11 belonging to the Czechoslovak air attaché, and a Klemm. There may have been more, but that simply records the result of a casual glance.

They are putting up a further edifice at Heston, but some controversy exists as to its future. Heston is likely to be used as a terminal by Imperial Airways Ltd. in foggy weather, in which case this building ought to be for Customs. On the other hand where is one to garage cars except under this new roof? The answer presumably is to invoke masses of fog down Croydon way and subsidise the local ecclesiastics to pray for fine weather at Heston.

During this time Miss Slade, who is Secretary of Airwork Ltd. and finds time to put in a lot of flying as well, had been doing some organising, with the result that Mr. Winsor was able to take our novice up in G-AACY. This is the white Moth belonging to Airwork Ltd. and is fitted with the new Graham wireless gadget. After this proselytising interlude had been completed, it was time for tea, and to the Social Focus we all adjourned.

During tea we heard the true story of the *fracas* at the Turks Head at Newcastle. The sub-title of this tale might be "Big Oaks from little Acorns grow." Who would have thought that the forgetfulness of a housemaid in omitting to turn off a tap at the top of the house, could have been enlarged into a deluge from a fire-hydrant which smirched the escutcheon of Civil Aviation. Talking of escutcheons, a new quartering is to be added to that of Civil Aviation, a hand *extendant* with a potted palm *pendant*.

In the early part of the afternoon Mr. Armour, who is responsible for a couple of cunning gadgets for the private owner, had been at Heston, and perhaps that was why we had started talking about apparatus for digging-in the wheels of machines which have to be moored out for the night. Unfortunately the future of these ingenious devices is by no means sure, for alternative means of achieving the same results have now been devised. Every private owner

A NEWCOMER.—The AL-1 two-seat side-by-side light aeroplane built by Surrey Flying Services of Croydon Aerodrome. It is fitted with a 60 h.p. Salmson engine. —(*"Aeroplane" photograph.*)

Digitized by Google

THE LATEST.—The new Simmonds Spartan (Cirrus) with increased span, which gives a much improved take-off and a slower landing, with a slight increase in speed.

will carry in a compartment at the bottom of the fuselage two terriers. On completing a landing the pilot pulls a release and a trap opens beneath the fuselage through which tumble the dogs. They immediately race for the undercarriage and begin a furious excavation behind each wheel. The winner races to the tailskid and repeats the performance. This dog receives a lump of sugar,—on the piecework principle. The proud owner then pushes his machine into the holes and, calling off the hounds, wanders away for a drink.

A suggestion was made which would considerably offset the gloomy modern tendency in flying suitings and the national leaning towards garments of black. The Canadian lumberjacks wear heavy flannel or wool jerkins which would be ideal for Winter flying. These coats have the additional advantage of being made in the most terrific colourings and checks. Every club might choose its own, with kaleidoscopic effects at the various meetings.

When tea was finished it had become too dark for any more flying and the visitors and people like Mr. Norman who emulate the ladybird and "fly away home," had already gone. So we went, too.

It was a perfect October afternoon and there could have been no better way of appreciating it. People who are interested in aviation ought to make a habit of taking out their friends who are not to some place like Heston and there put them wise, as the Americans might express it. Such visitors will certainly come away impressed by the matter-of-factness of the light aeroplane.—T. J.

THE LEICESTERSHIRE CLUB.

The flying times of the newly-formed Leicestershire Club are distinctly good. From Sept. 13 to 30 inclusive they are, dual, 20 hrs. 35 minutes; solo, 14 hrs.; other flying, 8 hrs. 25 minutes; a total of 43 hrs.

The Club aircraft, the *Quorn*, was first tested on Sept. 13 in readiness for the Pageant next day—already reported in The Aeroplane. It flew on 15 days of the remainder of the month, so the start gives hopes for the future.

Messrs. Hurst, Warren (the ground engineer), and Winn (the chairman), all previously known to the club's pilot, Mr. Bateman, as members of the Nottingham Club, and all three ex-R.F.C. pilots, were the first three members to be released for solo in the order shown, after the usual formality of a couple of landings. Mr. Cobb of the Midland Club was the next member to be launched.

Mr. Medcraft was the fifth pilot member to go solo. His return to flying after being lost to the game for over eleven years necessitated just one or two more landings than the traditional couple.

The following members have had dual instruction primary and secondary, in the *Quorn*,— Messrs. Baxter, Franklin, Wildbore, Coltman, John Squirrel, P. Palmer (the Leicester Regiment), Brown, How, Crowdy and Austin.

On Sept. 25 the uses of air transport were demonstrated by the Chairman, Mr. Roy Winn, who flew to Manchester with the pilot-instructor on business. The machine was then flown to Hooton Park to pick up Mr. Cyril Hurst who had been up in Liverpool on business also and wished to return that day urgently. The machine returned to instructional work in the afternoon.

The Director of Civil Aviation paid the Club a visit on Oct. 12. He was flown down from Leeds by Sq. Ldr. Leslie. He inspected the aerodrome, hangar and club house, and expressed satisfaction with all. He then attended a lunch in Leicester at which 80 members of the Club were present. He was amazed at the rapid growth of the Club (the membership is now close on 200), and he returned to the aerodrome in the afternoon. He then flew to Tollerton (the Air Park of Nottingham) in the *Quorn*, Mr. Roy Winn accompanying Sq. Ldr. Leslie in the official machine. There was nobody to meet them on arrival.

THE YORKSHIRE AEROPLANE CLUB.

The flying time for the month of September has been 127 hours 5 minutes. Throughout the month the Club has had only two machines in commission and therefore the flying

THE NEW SPARTAN.—Well-based rumour says that an announcement is soon to be made concerning the taking over of the Simmonds Spartan firm by big financial interests.

AUSTRALIAN EAST-TO-WEST AIR RACE

SWEEPING SUCCESS OF DE HAVILLAND AIRCRAFT

The Australian trans-continental air race from Sydney to Perth, which started on September 30th and finished 6 days later, proved an outing for no less than five types of de Havilland aircraft and an overwhelming triumph for the Gipsy Moth.

FASTEST TIME = GIPSY MOTH

Pilot—Major H. de Havilland—averaging 107 m.p.h. for the 2,450 miles.

2nd = DH. 50. **3rd = DH. 9.**

On handicap the results were:

FIRST = DH. 9. = PILOT: Captain A. C. MILLER.

SECOND = GIPSY MOTH PILOT: Major de HAVILLAND.

THIRD—GIPSY MOTH FIFTH—GIPSY MOTH
FOURTH—GIPSY MOTH SIXTH—GIPSY MOTH

The race was one of the most severe ever held, wind, rain and dust-storms being encountered all the way.

10 GIPSY MOTHS STARTED = 9 FINISHED

(the remaining machine hitting a tree in dense fog). The nine finished in perfect condition after being flown at full throttle throughout the 2,450 mile race.

time compares very favourably with August, when they had three machines in commission and only did 106 hours.

Messrs. Lockey, Illingworth, Ellis, Garside and Winandy have made very creditable first solos and Lockey and Illingworth got their "A" Licence tests done before the end of the month.

Six new flying members and two associate members joined during the month and all the new flying members have started instruction.

THE NORTHAMPTONSHIRE AERO CLUB.

During September 5 flying members and 11 associate members joined the Northamptonshire Club. The total membership is now over 300.

The flying time for the month was 67 hrs. 5 mins., dual 36 hrs. 35 mins., solos 13 hrs. 5 mins., passenger flying 7 hrs. 50 mins., tests 9 hrs. 35 mins. Instructor E. F. Palmer. Ground Engineer J. Gallagher. Aircraft (two) G-AAIE and G-AAIC.

In response to popular demand the Committee have provisionally fixed their next Flying Meeting for Whit Monday, 1930. The Flying Committee intends to get going on novelty events for this meeting and Secretaries of Clubs are asked to kindly make a note of the date.

The Annual Meeting of the Club was held on Oct. 7. About 60 members were present. Mr. K. Whittome and Mr. G. W. Baldwin were elected new members of the Committee. The Club bar accounts and balance-sheet were read, and showed a profit on the 6 months' working.

The flying for the 5 months from April to Sept. 1 makes a total of 300 hours.

THE ASSOCIATED AUSTRALIAN AERO CLUBS.

The title of the Australian Aero Club has been changed to "The Associated Australian Aero Clubs."

The new Association consists of the following: The Australian Aero Club, Victorian Section; the Aero Club of New South Wales; the Australian Aero Club, South Australian Section, Ltd.; the Australian Aero Club, Queensland Section, and the Australian Aero Club, Tasmanian Section.

The Association will be the controlling body in the sport of flying in Australia under the regulations of the F.A.I.

Each year the Association will elect a chairman, and each constituent club will nominate one delegate to be its representative at all meetings during the year.

The Association may admit other clubs when formed, but only one club from each State is eligible to be a member.

The first chairman of the Association is Mr. H. A. Rigby, and the first secretary is Mr. G. N. Moore.

THE AERO CLUB OF NEW SOUTH WALES.

The report for the year ending Aug. 31, 1929, of the Aero Club of New South Wales shows an excess of expenditure over income of £314 5s. 4d. This is due to the impracticability of making the social and sporting activities of the Club self-supporting under the adverse conditions at Mascot Aerodrome.

At a Special General Meeting held on Aug. 6 approval was granted for the purchase of 210 acres of land near Warwick Farm for the Club's own aerodrome. This will be made into a first-class aerodrome with the additional amenities of a Country Club and Golf course, and the Committee hopes that when this is completed the social and sporting activities will become self-supporting.

During the year the total membership increased from 705 to 855. The pilot members increased from 112 to 179 and the pupil members from 60 to 75.

The total number of hours flown during the year was 4,975, which was an increase of 459 hours over the total flying time for the previous two years ending Aug. 1, 1928.

The Club's fleet has been increased to thirteen by buying a Westland III (Widgeon), a D.H.9 and by the loan of three Gipsy-Moths from the Commonwealth Government. During the year one Gipsy-Moth was written off owing to destruction by fire after an accident which did not involve any injury to the pilot.

The Chief Instructor, Mr. E. W. Leggatt, M.C., resigned during the year, after three years' service, and Mr. F. W. Follett, formerly Superintendent of Aircraft in the Civil Aviation Branch of the Defence Department joined the Club as Manager and Chief Instructor.

Mr. T. W. Shortridge, the assistant instructor, resigned in Jan., 1929, and his place was filled temporarily by Mr. A. A. N. Pentland, M.C., D.F.C., until the arrival of Mr. R. Beresford from England.

As the result of a conference of representatives of all the Australian Flying Clubs the Club entered into an agreement with them for the formation of an association named "The Associated Australian Aero Clubs" through which all the clubs will become affiliated to the Royal Aero Club and the F.A.I.

In pursuance of its policy to co-operate in the establishment of Flying Clubs in country districts, the Club assists in the formation of Clubs at Crookwell, Newcastle, Lismore, Ballina, Coff's Harbour and Parkes.

THE INDIAN FLYING CLUBS.

Between January and June 1929 the four active Flying Clubs in India, i.e., Karachi, Bengal (Calcutta), Bombay and Delhi, put up a total of 1,892 flying hours.

In *ab initio* training, both dual and solo, Karachi flew 400 hours, Bengal (Calcutta) 371 hrs. 55 mins., Bombay 428 hrs. 5 mins., and Delhi 177 hrs. 5 mins.

Up to Aug. 19 the Aero Club of India and Burma had granted 34 "A" certificates, of which 12 were for the Karachi Club, 5 for the Bengal Club, 11 for the Bombay Club and 6 for the Delhi Club.

The average time taken to train *ab initio* pupils was:—Europeans, 10 hrs. 5 mins.; Indians, 21 hrs. 13 mins. The first Club member to qualify for an "A" licence was Mr. J. R. D. Tata, who passed his tests on Feb. 10. He went solo after only 3¾ hours' dual instruction.

All Indian Clubs used Gipsy-Moth biplanes. Late last year Sir Charles Wakefield offered to assist the Flying Clubs in India in any way the Committee of the Aero Club of India and Burma thought most fitting. They decided to ask him to present a Gipsy-Moth to the Club that first turned out 10 pupils with an *ab initio* aviator's certificate, of whom not less than six should be Indians.

The Bombay Flying Club turned out the required number of pilots by the end of May and were presented with a Gipsy-Moth on behalf of Sir Charles Wakefield.

THE WINNIPEG FLYING CLUB.

This is from the Bulletin of Western Canada Airways Ltd.:—

Mr. Konrad (Connie) Johannesson has been appointed instructor in place of Mr. M. de Bliquy and has already taken in hand the duties relevant to that position. Mr. Johannesson, who is well known locally as a hockey player and a member of the old Vic Team, learned to fly back in 1917 at Ismalia, Egypt, using a Maurice Farman for his kite. Later at Suez on Avros and thence to Heliopolis where he was appointed instructor during 1918 and continued at those duties until he returned to Canada in 1919. Of late he has been assisting W. Straith of North West Airways and has over 600 hours to his credit. One feels sure that the fine flying record which has been set up by the Club since its inception will be maintained under Mr. Johannesson's supervision.

A TEST OF STAUNCHNESS.

The following cable from Major Hereward de Havilland has arrived at Stag Lane:—

Just returned from Perth having completed journey of 5,000 miles during which Gipsy engine ran splendidly averaging 2,350 r.p.m., and 17 miles to the gallon of petrol. One stage of 770 miles only used one quart of oil. Only work on engine throughout trip was adjustment of tappets and cleaning filters. Not necessary to touch plugs. Vacuum Oil Co.'s products used throughout.

LADY BAILEY'S TRIP.

On Oct. 12 Lady Bailey left Croydon at 11.00 hrs., on the start of a trip to Oslo. She reached the Schiphol aerodrome Amsterdam, at 14.30 hrs.

On Oct. 13 she left Schiphol at 07.00 hrs. and reached Copenhagen in the afternoon.

On Oct. 14 Lady Bailey flew from Copenhagen to Gothenburg, as bad weather prevented her from flying to Oslo, whither she is proceeding by train.

GOD'S FREE AIR.

If you would learn the difference between "Technical Air" and the type described in the heading you must go to the lecture on "The Art of Flying Land and Sea Machines," by Mr. Norman MacMillan, the chief test pilot of the Fairey Aviation Co. Ltd. In fact you must go anyway because it will be worth while.

The lecture will be held at the Royal Soceity of Arts, 18, John Street, Adelphi, W.C.2, on Oct. 24, at 6.30 p.m. Anybody can go to the lecture, the only procedure is to sign the visitors' book.

As is well known, Mr. MacMillan has written the standard text-book on the art of flying. This lecture should be very instructive and one hopes the manipulators of "technical air" will be there in force to debate this theory of free air.

MANDIBLE-RISKS.

The following is given by the Bulletin of Western Canada Airways Ltd. as an example of the difficulties encountered and overcome by their intrepid pilots in the course of their day's work:—

"Charter trip to Pagua Lake, E.N.E of Pickle via Badesdawaka and Kakagiwizida Lakes, Ozheska River and north to Ishanakie and Pagua—camped at Papaonga Lake."—Jarvis, on Forestry Patrol.

Apparently crash-risks and fire-risks in this area are quite equalled by jaw-break risks.

Digitized by Google

COMMERCIAL AERONAUTICS.

CIVIL AVIATION PROGRESS.

A lecture on *The Progress of Civil Aviation* was given by Air Vice-Marshal Sir Sefton Brancker, K.C.B., A.F.C., at the Royal United Service Institution on Oct. 9.

In the absence of Lord Thomson, who was unable to be present, the Chair was taken by Sir Herbert Hambling, Bt., D.L., J.P., the Government nominee on the Board of Directors of Imperial Airways Ltd.

Introducing the Lecturer, Sir Herbert Hambling said that Sir Sefton Brancker had done more for Civil Aviation than any man living.

SIR SEFTON BRANCKER said that Civil Aviation was too wide a subject to be discussed in one lecture and he would therefore confine his remarks to Air Transport and ignore the many other branches of Civil Aviation such as Survey, Forest Patrol, Crop Dusting, etc. He would also restrict his remarks to the progress which had been made since he last lectured before the Royal United Service Institution in November, 1927.

Practically all the important countries in the World had National Air Transport Companies which were run with the help of State subsidies. The United States of America was the notable exception to this rule and in their case the air lines were supported by very generous postal contracts.

In France the policy from the beginning had been one of quick communications with their overseas possessions. France had a number of main air lines, including one via Constantinople to Syria and the Far East, and one via Spain and the Cape Verde Islands and to South America. She also had a number of local lines from Paris to London, Berlin, and other cities. France would be spending two million pounds next year on subsidies to Civil Aviation.

Germany, prevented since the War from building military aircraft, had been able to concentrate on civil aircraft. The Nine Rules of the Peace Convention had caused her to concentrate, until they were withdrawn in 1926, on internal air routes and had also promoted the development of German factories abroad. The result had been that German aircraft were firmly established in many countries, mainly Persia, Spain and South America.

In 1926 the Government had given a monopoly to the Luft Hansa, which firm had extended one route to Barcelona for South America and another to Moscow with the co-operation of Russia. This latter route, which would eventually go to Pekin, was now being flown by night on the section between Berlin and Koenigsburg. Germany intended to operate a night route from Berlin to London next year.

The withdrawal of some of the subsidies in 1928 had given the German air transport companies an opportunity for a general check up on their expenditure and economical overhaul. Germany tended towards very big machines, chiefly monoplanes of all-metal construction.

Describing a flight he had in the Do.*x*, the Lecturer said that the machine weighed 52 tons, got off in 32 seconds, cruised at 112 m.p.h., was light on the controls and manœuvred easily. The top deck contained the control cabin, the crew's quarters and the wireless cabin. This deck was noisy but not unduly so. The second deck contained the passenger accommodation, which was quiet and comfortable. And the lower deck carried the baggage and fuel. Two of these machines had already been sold to Italy.

The United States of America had made extraordinarily good progress in the past two years. They had a reliable climate, long distances, wealthy citizens and no international complications. There was only one subsidised air line, the one to Chile, the others existed and even made money on the generous mail contracts.

The U.S. Postal authorities were prepared to, and did, lose one million pounds every year on the postal services and they did not know or care whether the air mails paid or not. The scheduled mileage for 1928 had been 7,382,000 miles.

The percentage of safety on the organised air routes was very high, but it was not so good on the miscellaneous services, the machines of which were not under Government control. The United States had 16,000 miles of lighted air routes for night flying. America was not producing enough aeroplanes for her own use and was sending people over to Europe to buy the best aeroplanes.

In all these countries and in others which he had no time to mention the regularity and safety of the air lines was very good, but the financial position in every case was bad. At the present time subsidies were an absolute necessity.

With regard to air transport operations in the British Empire, the work that had been done in Australia was a credit to the Empire. No less than 421,000 miles had been flown on regular air routes in 1928. Only British machines were used on these routes at present and the difficulties were all the greater because the small population did not justify daily flights, which were a better commercial proposition than weekly ones. Australia was considering an extension from Northern Australia to Singapore to meet the Imperial Airways route.

Canada had only recently taken up air transport but already 3,500 miles had been organised. Previously civil aviation in Canada had consisted of air survey, forest patrol, crop-dusting, etc. To-day there were twenty-five recognised air transport companies in Canada. They had no subsidies but followed the American practice of postal contracts. Unfortunately American aircraft were used to a great extent.

South Africa had no great air transport of her own but was ready to help with the Imperial Airways scheme for a route from England to the Cape.

The Government objective in fostering Civil Aviation was the improvement of Empire Communications. The routes flown by Imperial Airways had shown a steady improvement in regularity and a steady advance in passenger and goods traffic.

The company's splendid record of safety had, unfortunately, been broken in 1929. Since 1927 Imperial Airways had added to their fleet the Short Calcutta, which the lecturer believed to be the best flying-boat in the world. The new 40-passenger Handley Page, which would be the next new type introduced for the India service, was, with the exception of the Dornier Do.*x*, the most ambitious passenger-carrying machine.

Discussing the future, Sir Sefton Brancker said that when he last lectured at the R.U.S.I., Imperial Airways had only just started the Cairo—Basrah section of the India route. There was now a weekly service to India. The ground organisation was not properly developed because they did not feel justified in spending the taxpayers' money on Persian soil and the Persians would not do anything about it.

There was also the question of changing the route entirely and taking it through Vienna, Belgrade, Athens, and Cyprus to Baghdad and then possibly right through Persia instead of down the Persian Gulf.

Also, when the line to the Cape was established, the India route would not go to Egypt at all.

With regard to the Cape route, this had been prospected by Captain Gladstone and Sir Alan Cobham. All the Colonies had agreed to come in on some general scheme and the Union of South Africa had committed themselves to subsidies amounting to £400,000 during the next few years. A final survey party was going to Africa in November next to arrange details.

Speaking of airships, Sir Sefton Brancker said that they were already a year behind his last prophecy, and that the R.101, being a further six weeks late, had missed the good weather and now might be many weeks before it could leave its shed. However they hoped that one airship would get to India this winter and one to Canada in the

Digitized by Google

spring. A great deal more capital and patience would be needed before they could be used as commercial transport.

Certain countries thought that when air routes crossed their territory the loads should be transferred to their machines and back again at the frontier. This would cause delay and confusion and would be most unpractical. A central control was wanted throughout long routes.

When competition grew keen, as it was bound to do, all the air routes would have to be adjusted to save time. In addition to taking the shortest route time would be saved by night-flying. About 700 miles could be flown a day by modern aircraft but with night flying this might easily grow to 1,800 miles in the 24 hours.

Cruising speed must be over 100 miles an hour. Speed not only saved time but it counteracted the effects of bad weather. But at the same time speed reduced paying load and put up cost.

Air mails would have to be carried in special machines and not with passengers. The big business was going to be with commercial aircraft in the future. Military aircraft would be the work of a few specialist firms.—C. M. McA.

NEWS FROM THE NORTH.

Northern Air Lines Ltd. expect to leave Wythenshawe in about six weeks as Chat Moss Aerodrome is nearing completion. This is probably the first aerodrome in Great Britain to have cinder runways, which are arranged like a carpenter's square with an arm at 45 degrees in the included angle. These runways are 200 ft. wide and up to 12 feet deep. The overall length in any of the three directions is about 700 yards.

The new N.A.L. hangar at Chat Moss is 200 ft. x 100 ft. with workshops 30 ft. wide running down the long side. The dope shop, the engine shop, and the stores will be heated. The N.A.L. offices will be in a separate building.

The aerodrome will boast a good residential hotel, as the near-by farm is being converted for this purpose.

N.A.L. are going to put joy-riding in a new category by using modern cabin three-seat cabin aircraft instead of open cockpit machines. The idea underlying this is not merely to modernise joy-riding but by means of joy-riding to introduce the general public to the comfort of travel by air-taxis.

NEWS FROM GERMANY.

The Berlin correspondent of *The Times* states that successful experiments were made by the Deutsche Luft Hansa at the Tempelhof aerodrome on Oct. 2 in the transmission of images by wireless to an aeroplane during flight. In three successive flights, a weather map, a sketch of a landing ground, and a plan of an advancing thunderstorm were received on a fultograph apparatus attached to the ordinary wireless set carried by large passenger aeroplanes.

The big 12-engined Dornier flying-boat known as the "Do. *x*" has completed its first trials without, it is claimed, any important modifications being found necessary. These trials lasted 10 weeks, and 30 flights were made. Starts were repeatedly made in little more than a minute with a load of 20,000 kilogrammes (nearly 20 tons).

On Oct. 1 a flight was made round Lake Constance with officials, journalists, and members of the Society for the Exploration of the Arctic by Air, on board. A flight with a full complement of passengers, possibly 100, is understood to be contemplated shortly, to be followed by a series of attempts to establish records.

After that, it is proposed to lead up with flights of increasing duration in the Lake Constance area to a flight across the Atlantic, but this is not to be expected before next year. For this purpose the interior arrangements are being worked out so as to provide a smoking room with a bar, forward, a "passenger deck," with private cabins for eight to 10 persons, and lavatories, kitchen, and store-rooms aft.

The experiments with crude oil aero-engines are, it is reported, being followed with keen interest at the Dornier works at Friedrichshafen in view of the prospect such engines would offer of increasing the radius of the "Do.*x*."

FRENCH AIR LINE REPRESENTATION IN LONDON.

M. P. E. Grosfils, who has for some years been the Manager for Great Britain of the French air transport company *Air Union*, has been appointed General Representative for Great Britain for the *Compagnie Générale Aéropostale*.

His new appointment will in no way interfere with his previous connection with *Air Union*, but will, on the contrary, unite the activities of the two companies whose offices are temporarily in the same building in Haymarket.

Aéropostale will shortly open new offices in the City with a view to a closer collaboration with the postal authorities, banks, transport and shipping companies. Although the *Aéropostale* has no direct lines from London its passenger and freight services—Paris—Bordeaux—Biarritz—Madrid, Marseilles—Algiers, and Marseilles—Barcelona—Casablanca, connect with four regular *Air Union* services from London.

Their most important service is that which operates between France, Africa and South America. And the opening of a branch office in London will, with the aid of the G.P.O., enable them to offer more direct service to users of the air mail from Morocco, French West Africa and South America.

THE DIRECT INDIAN AIR MAIL.

The following notice was issued by the General Post Office on Oct. 9:—

Now that the Direct Indian Air Service has been in operation for 6 months, it may be of interest to give some particulars of the results.

The service by Imperial Airways to India was inaugurated on Mar. 30, 1929, from Croydon, and the first return flight commenced from Karachi on April 7.

The route taken is by air from Croydon via Paris to Bâle, thence by train to Genoa; subsequently the air route followed is Genoa—Athens — Tobruk (Libya) — Alexandria—Gaza—Baghdad—Basrah—Jask (Persia)—Gwadar—Karachi. The eastbound aeroplanes leave Croydon every Saturday morning, and the westbound service starts from Karachi every Sunday morning; the actual time of transit over the whole route is 7½ days.

The service was thrown open at the start for the carriage of the air mails of every country on the actual route; and, after a few weeks' experimental period, it was made available (in June) to the mails of every country in the Postal Union.

Austria, Belgium, Canada, Ceylon, Czecho-Slovakia, Egypt, France, Germany, Greece, Holland, India, Iraq, Irish Free State, Latvia, Palestine, Persia, Sweden and the United States of America, are either using, or have expressed their intention of using the service. The list is not exhaustive.

The traffic to and from India has been increasing steadily week by week. From an average of about 300 lbs. in either direction (India only) the average weekly weight is now over 550 lbs., representing nearly 5% of the total letter mail outward, and over 5% inward. (It should be mentioned that the weight of the ordinary mail outward is greater than the inward).

The average weekly weight of the whole mail despatched from London is nearly 750 lbs., and of the mail received about the same or 1,500 lbs. a week in all. This does not include mail loaded at intermediate places of which complete figures are not yet available.

During the first 6 months' working of the service 14,656 lbs. of mail have been carried from London to various destinations, and 17,529 lbs. of mail have reached London; or a total weight in both directions of 32,185 lbs. The corresponding figures for India alone are 11,893 lbs. outward and 11,436 inward.

According to existing information there is no regular long-distance service operated from Europe whose traffic figures can compare with these.

The service has been operated from the start with remarkable regularity. Outward, apart from the tragic Jask disaster, there have only

been two late arrivals in India (owing to floods and to sand-storms respectively) in 26 flights; and homeward there have been three late arrivals (two owing to missing the train connection at Genoa, and one owing to sand-storms).

The normal closing time for the Air Mail to India during the summer flying period was 7 a.m. on Saturdays at the General Post Office, London; but arrangements were introduced in September for a late posting (with special charge) at Charles Street Branch Office, near Charing Cross, up to 9.25 a.m.

As from the 12th Oct. the hour of departure from Croydon will be put back to about 8.30 a.m., owing to the change to Winter time and the need for leaving a wider margin for the journey to Bâle, where the train connection to Genoa must be made. The latest time of posting will therefore be 6 a.m. on Saturdays at the General Post Office, and the late posting at Charles Street will be suspended until the Spring. The latest time of posting in the Provinces varies, but information on the subject can be obtained at local Post Offices.

The fees charged to the public, 6d. to India and Persia, 4½d. to 'Iraq, and 2½d. to Egypt and Palestine, *per half oz.* in each case, are very appreciably lower than the fees charged for comparable services conducted by other countries.

The only serious difficulty which has been experienced is with letters which are despatched by the public with insufficient postage to cover the air fee. The Post Office is not permitted by the International Air Mail Agreement (to which Great Britain is a party), to send by air letters which do not bear the minimum air fee and, even if this were possible, a large number of the letters would inevitably be refused owing to the amount of the surcharge, which averages at least 1s. per letter.

Where the name of the sender is known, effort is made whenever practicable, to inform him of the under-payment of his letter and to give him an opportunity of affixing stamps for the deficiency before the mail leaves. But in many cases the sender is not known or the error is considerable, and there is no course open but to send the letter by ordinary mail with consequent heavy delay.

Most of the errors appear to be due to an impression that a 6d. air fee will cover any weight, instead of being the fee for each ½ oz. The public are therefore asked once more to note, in using the Indian Air Mail, that letters to India must bear stamps to cover the ordinary postage plus the air fee at 6d. per ½ oz. or fraction thereof. The air fee to Egypt and Palestine is 2½d. per ½ oz. plus postage and to 'Iraq and Persia 4½d. per ½ oz. plus postage. Ordinary postage to Egypt, Palestine and India is 1½d. for the first oz. and 1d. for each succeeding oz. To 'Iraq the rate is 2½d. for one oz. and 1½d. for each further oz.

THE LONDON TERMINAL AERODROME.

ANALYSIS OF FIGURES FOR PAST WEEK.

Trips per Day.—Sunday, 11; Monday, 25; Tuesday, 26; Wednesday, 29; Thursday, 26; Friday, 23; Saturday, 24.

CROYDON NOTES.

The man who went to Cardington and said, "I understand there are a hundred and one reasons against your balloon ever flying," is not expected to recover.

Some departmental humorist, doubtless wishing to make British Air Lines Ltd. seem still more British, has officially christened Captain Corko Lino's new Fokker F.III—G-AARG.

Conversations on the following lines are often to be overheard:—

Corko (*briskly*): "Morning, Gaarge, morning. Pretty fit I hope, eh? Nasty spot of weather this morning, but flyable Gaarge—Oh yes, distinctly flyable."

Gaarge (*without enthusiasm*): "Oi be turrible bad with rheumatics in me centre section this marning, Muster Corko, Sur. Creaks something cruel it does if I attempts to move."

Corko: "Dear, dear, Gaarge, I'm sorry to hear that. There's a little job in Plymouth to-day—"

Gaarge (*bitterly*): "You surely ain't got the 'art to want me to go to a place like Plymouth, Muster Corko, with me rheumatics so bad an all. Leave alone the place is full of them 'orrid sailors wot I 'ates."

Corko (*persuasively*): "They make the gin there, Gaarge."

(Gaarge, unmoved even by gin, refuses to start up and Corko retires behind his gilded cage baffled.)

Passenger traffic has never been so good in October as this year. Imperial Airways have had all the traffic they could handle on the Paris line. Helped by the Motor Show, and Air Union, loads have been much above the average. The Royal Dutch Air Line (K.L.M.) too has maintained a steady passenger traffic which shows no sign of decreasing in spite of the time of the year.

Imperial Airways have had a number of machines standing by for the R.101 flight. Some special planes have been kept in readiness since Thursday last.

There has been a lot of criticism of R.101, by the way, but the critics fail to realise the subtlety of the whole scheme.

What is doubtless intended, is to wait for a steady head wind of about 80 miles an hour and then to gloriously circumnavigate the habitable globe *backwards* at about 30 m.p.h. That will teach America what freak flying records mean. [Really our friend Spry must not be jocose about our only (at the moment) airship. Even though the official humorist has called it G-FAAW it is not a joke.—C. G. G.]

In *The Evening Standard* of Oct. 7 an excellent person wrote an article pleading passionately for brighter flying. He compared commercial aviation unfavourably with water chutes, scenic railways and merry-go-rounds, so far as thrill was concerned, and lamented bitterly that air travellers now miss that feeling of adventure. He does not mention in his catalogue of "all the fun of the fair" those splendid "Haunted Houses" in which the floors sink suddenly from under the victim, the walls heave and shudder, and where hot and cold blasts of air blow from all quarters, whilst things invisible flap, bang, creak and groan.

If *Evening Stan* will let us choose his commercial aeroplane route and weather conditions, we guarantee all the sensations he ever felt at any Fun City, together with a number of new and excruciating ones. Moreover, he shall have paper bags galore *and* a cuspidor.

He talks for some unfathomable reason, of stepping forth from an airplane (*sic*) into a disappointingly cheerless void at Croydon. Now Croydon is *not* a void because it has about four bars and a buffet. But let *Stan* fly in the really bumpy weather we will choose for him, and he will know all about "disappointingly cheerless voids" in his own proper person.

News comes from America that the 32 passenger Fokker F.32 with four 525 h.p. Pratt and Whitney Hornets, has made successful test flights at Teterboro Airport. This machine is said to have a wing span of 99 feet 6 inches, a height of 16 feet 6 inches, and a wing area of 1,350 square feet. Its top speed is reported as nearly 160 m.p.h., cruising speed being 120 m.p.h. and landing speed 60 m.p.h., though

HANWORTH—THE LONDON AIR PARK

BERKS., BUCKS., AND OXON LIGHT AERO-PLANE CLUB.

HULL AERO CLUB — YORK-SHIRE AERO-PLANE CLUB.

Learn to fly... economically... at an N·F·S· Club

ONE of the chief aims of National Flying Services is to provide the most convenient facilities for flying at the most moderate rates. The instructional facilities at N.F.S. Clubs are unequalled in this Country. At any of the N.F.S. Air Parks so far established, the flying pupil is able to undergo a thorough course of instruction for a private pilot's license with the least delay and at a minimum of expense.

The cost of learning to fly is under £25 for the member of average adaptability. Upon qualification, the N.F.S. flying member has the privilege of hiring and flying N.F.S. machines at specially favourable charges, which include fuel and oil, insurance, and free landing and housing at any N.F.S. station.

From the standpoint of the individual member, no better plan could be devised than the N.F.S. club flying scheme. Acting through his Club Committee he has an effective voice in the Club's management on the social side, whilst at the same time the provision and maintenance of the club aircraft, on the flying side, is in the hands of a large organisation enjoying ample resources and operating on economical lines. Moreover, as a member of one of the N.F.S. clubs he becomes an honorary member of every club in the group.

A limited number of members are now being enrolled at the following rates:— Hanworth Club: Flying Members, 5 gns. entrance fee, and 5 gns. annual subscription; Non-flying members, 3 gns. in each case. Other Clubs: Flying Members, 3 gns. entrance fee, and 3 gns. annual subscription; Non-flying members, 1 gn. in each case. No entrance fee is payable by Serving Officers of H.M. Regular Forces, or Members of the Corps Diplomatique.

Malcolm Campbell (London) 1927 Ltd.

Can offer you the highest and most efficient facilities on the purchasing of light aircraft.

In January last we were specially appointed Moth Agents, and up to date we have definitely sold more Moths than the total sold by all other Moth Agents in England.

WHY? Because we are the pioneers of part exchange and Hire Purchase of D.H. Moth aircraft, and we also issue a combined insurance policy, which (with the exception of a small excess) makes the owner of a machine free from all other financial commitments.

These are obvious reasons WHY you should buy your Moth from us and avail yourself of our advice and service at

Byron House, St. James's St., London, S.W.1,

THE AUTOGIRO

The C 19 Machine, with device for starting the rotor blades.

The Autogiro constitutes the first practical solution of the problem of completely controlled flight.

It ensures safety.

It cannot stall.

It can ascend and descend in a small area.

For further particulars apply to:

THE

CIERVA AUTOGIRO COMPANY Ltd.

BUSH HOUSE, LONDON, W.C. 2.

Telephone; Central 4861.

during tests it landed at 47 m.p.h. Rate of climb is given at 1,200 feet per minute.

By the time the Royal Dutch Air Line is ready for a 32-seater, this aeroplane should have been thorougly tried out in America, and the first one built in Amsterdam will be in no sense experimental,—a great advantage for any operating Air Traffic Company.—Spry.

BRITISH AIRCRAFT IN CANADA.

During July forty-five aircraft certificates of registration were issued in Canada. Of this number twenty-two were for British aircraft, of which thirteen were D.H. Moths and nine were Avro Avians.

THE STRENGTH OF SHAFTS IN VIBRATION.

[*The Strength of Shafts in Vibration.* By J. Morris, B.A., A.F.R.Ae.S. Price 30s. Published by Crosby, Lockwood and Son. Obtainable from The Aeroplane Book Dept., Cannon House, Pilgrim Street, E.C.4.]

This book is just ready and a review will appear in The Aeroplane shortly.

The problem of vibration in light shafts running at high speeds has been coming more and more to the fore. This book has been written with the object of illustrating how rigid dynamics can be usefully and readily applied to various vibration problems in shafts. The applied mathematics used have been reduced to relative simplicity by a judicious choice of notation and the methods of attack adopted.

The book is recommended to the attention of all aeronautical engineers who are looking ahead. This problem of vibration in shafts is bound to be of increasing importance in view of the forthcoming use of shaft-driven pusher airscrews.

NEW COMPANIES.

Arens Control Ltd.—Private company. Registered Sept. 27. Capital, £5,250 in 4,750 preference shares of £1 each and 9,500 "A" ordinary and 500 "B" ordinary shares of 1s. each. Objects: To acquire from C. A. Arens a manufacturing and selling license in respect of an invention known as a power transmitting device, and to carry on the business of mechanical engineers, manufacturers of and dealers in engines, mechanical vehicles, water and air craft, etc. The subscribers (each with one ordinary share) are: R. Faulkner, 17, Cheyne Walk, S.W.3, member of London Stock Exchange. L. H. Freeman, 6, Neville Court, Abbey Road, St. John's Wood, N.W.8, company director. The holders of a majority of the issued preference shares may appoint three directors. The said L. H. Freeman shall be a director so long as he holds 2,000 ordinary shares, with power to appoint one other. Solicitors: Warren Murton and Co., 45, Bloomsbury Square, W.C.1.

PERSONAL NOTICES.

Deaths.

CLARKE.—On Oct. 11, at Brough, Yorkshire, as the result of a flying accident, John Clarke, Flying Officer, R.A.F.

John Clarke was born at Dalston, Carlisle, in 1905. He joined the Royal Air Force as an Aircraft Apprentice in 1923 and was trained at the School of Technical Training, Halton. He showed remarkable ability during his training and passed out of Halton with a Cadetship for Cranwell.

At Cranwell he was promoted Flight Cadet Under-Officer, and on passing out was awarded the Sword of Honour as the best all-round Flight Cadet, the R. M. Groves Memorial Prize, which is awarded to the best all round pilot in the Senior term, the Abdy Gerrard Memorial Prize for the Flight Cadet obtaining the highest total marks in Mathematics and Science, and the Air Ministry Prize for Aeronautical Engineering.

He was posted, in December, 1926, to No. 29 (Fighter) Squadron, then at Duxford, and remained with the Squadron when it moved to North Weald. He passed a course of Air Pilotage and Navigation at Calshot in the Spring of 1927 and in the following June was promoted to be Flying Officer.

In May, 1929, he represented his Squadron in the annual race and competition for the Sassoon Trophy and took second place. He started 4 mins. 3 secs. behind the winner and finished only 3 mins. 9 secs. behind him,—thus proving that he was flying a better course.

At the R.A.F. Display in July, 1929, he, with Sjt. Morton, gave a display of advanced aerobatics, these two representatives of the Squadron having been the runners-up in the Aerobatics Competition for Fighter Squadrons.

Only a month ago he was posted to the R.A.F. College, Cranwell, as lecturer on air pilotage, but he was temporarily detached for duty with No. 29 (Fighter) Squadron to take part in the R.A.F. Displays at Newcastle and Hull.

He was leaving the Brough aerodrome to return to Cranwell when the accident occurred in which he lost his life.

He played Rugby Football for the Cadet College at Cranwell and was in the Station team at Duxford which won the R.A.F. Cup in 1928. Last season he played for the R.A.F. in practically every match including those against the other Services.

John Clarke's death is a great loss to the Royal Air Force of which he was a most promising young officer and a brilliant pilot; to the sport of flying as the owner, designer and constructor of a light aeroplane of particularly clean lines and good performance; and to many of us who were his friends.—C. M. McA.

KELLY.—At Netheravon, Wiltshire, on Oct. 10, as the result of a flying accident, L-AC. Thomas White Kelly, R.A.F.

Births.

BILNEY.—At Quetta, on Sept. 23, to Nell, wife of Flt. Lt. C. N. H. Bilney, R.A.F.—a daughter.

BRIDGLAND.—On Sept. 30, at Rimac, Pelham Gardens, Folkestone, to Avril (*née* Courage), wife of Capt. C. A. Bridgland, D.F.C., late The Royal Corps of Signals—twin daughters.

SHERREN.—On Oct. 13, at "Montana," Bath Road, Felixstowe, to Joyce, wife of Sq. Ldr. P. C. Sherren, M.C., R.A.F.—a son.

AIRCRAFT CAMERAS.

"Eagle" Aircraft Cameras and Equipment. Specialists in air photographic apparatus. Particulars from the manufacturers and patentees, Williamson Manufacturing Co., Litchfield Gardens, Willesden Green, London, N.W.10. Telephone 0073-4 Willesden. Telegrams, "Kinetogram Willroad London." Contractors to the Admiralty, Air Ministry, War Office

AIRCRAFT FOR SALE.

For Sale, price £600, Gipsy Moth G-AAEV, flown 70 hours. Owner Miss Tremayne Miles gone abroad.—Apply Secretary, Bristol and Wessex Aeroplane Club, Filton, Bristol.

Authorised Moth Agents.—Immediate delivery on payment of first deposit of £195 which includes insurance, balance payable to suit customer's convenience. Your old machine taken in part exchange. Write for particulars of recent successes. Special offer, trial lesson 12s. 6d. 45 minutes Paddington.—Reading Aerodrome. 'Phone Sonning 114.

For sale by order of Mr. A. S. Butler, Chairman of the De Havilland Aircraft Co. Ltd.:—Mr. Butler's special two-seater racing Moth with standard Gipsy engine. Top speed 120 m.p.h. Fastest time for light aeroplanes in 1929 King's Cup Race, average 118½ m.p.h. over 1,100 mile course. Now fitted with completely overhauled Gipsy engine, equal to new. Flown two hours only since overhaul. Price £600. Inspection by appointment at Stag Lane Aerodrome, Edgware, Middx. (Telephone Edgware 0171.)

Lt.-Col. G. L. P. Henderson offers two Moths, Mark II Cirrus, slots, etc., guaranteed perfect, with C. of A. for long periods, £450 each. Also two Avro 504's built 1925 and 1927, as new, with or without engines, at bargain prices. Also several Moth compasses, as new £10 each and "Moth" 25 gall. extra oil and petrol tanks (£44 list price) for £15 complete ready to fit.

FOR SALE.

Avro 504K Spares. New Main Planes; Cowlings; Undercarriages; Skids; Tanks, etc. Send for separate list. Coley Ltd., Queen Elizabeth Road, Kingston-on-Thames. 'Phone 0365.

AERO ENGINE DESIGNER required

An old-established British firm, with special and long experience in the manufacture of aero engines, is requiring a designer of first-class capabilities and experience.

Applications are invited from those who have had experience in the design of aero engines of all types with particular reference to Compression Ignition engines.

The position has big possibilities for a designer of brilliance, originality and tact.

Write in confidence giving particulars of experience, remuneration expected and fullest possible details to:—

BOX NO. 710, WILLING SERVICE, 364, Gray's Inn Road, London, W.C. 1.

British Air Lines.—Croydon Aerodrome. Cabin monoplanes for charter, day or night, all machines fitted with wireless telephony. Our own private car picks you up anywhere within a radius of 25 miles, free of charge. 'Phone:—Fairfield 5824. Telegrams:—Britalyne—Croydon.

AIRCRAFT INSTRUMENTS.

Coley Ltd., Aircraft Surplus. Main Oil Tanks, 10s.; Windscreen frames and brackets, without glass, 2s.; K.L.G. Plugs F.9, new in maker's boxes, doz., 9s. 9d.; Smith's Revolution Indicators, 600-2,600 r.p.m., with 3 ft. drive, 22s. 6d.; Cross Levels, 1s. 6d.; Dashboard new spotlamps, 2v. bulb and length of wire, 1s. 9d.; Above postage paid. Free List obtainable. Coley Ltd., Ordnance Works, Queen Elizabeth Road, Kingston-on-Thames.

SITUATIONS VACANT.

Draughtsmen, first-class senior men required, preferably with Aero-Engine experience.—Write stating age, full experience and salary required to Box No. 5725, THE AEROPLANE, Cannon House, Pilgrim Street, E.C.4.

Required immediately, Assistant for Stressing Department. Write stating experience, age and salary required to Handley Page Ltd., Cricklewood, N.W.2.

SITUATION WANTED.

Pilot, R.A.F.O., excellent flying record, 700 hours, B licence, requires job.—Apply Box No. 5726, THE AEROPLANE, Cannon House, Pilgrim Street, E.C.4.

TUITION.

We offer sound instruction in Aeroplane Design, Fitting and Rigging, and Aero-Engine Fitting and Rigging; also expert training for Ground Engineers (Categories A, B, C and D). All tuition is by correspondence. Write to-day for our "Aeronautical Engineering" Booklet. International Correspondence Schools Ltd., 179, International Buildings, Kingsway, W.C.2.

YOU'LL GET A BETTER BID FOR YOUR MACHINE AT BROOKLANDS.

Send full particulars of your second-hand aircraft to the Brooklands School of Flying. You'll get a better bid for it there. And a better deal when you buy a new machine in part exchange for your own. The School's Sales Manager knows the second-hand market intimately and pays the full market price.

BECOME OWNER PILOTS AT THE LOWEST POSSIBLE COST.—Buy your new Moth at Brooklands—Official D.H. Agents. Through its important financial connections the School can sell on specially attractive hire purchase terms.

SERVICE AFTER SALES.—To those who buy their new Moths from us we offer FREE SERVICE for the first month. The life of an engine depends on its treatment during this period.

REPAIRS AND OVERHAULS.—The School has extensive workshops and undertakes all repairs and overhauls for C. of A.

SPECIAL CHARTER.—Four-Seater Saloon machine available at shortest notice. Any distance.

FIRST-CLASS TUITION—NO SUBSCRIPTION.—Flying tuition at Brooklands is unequalled. Since June, 30 pupils have found that to be well taught *pays* in the end. Sound instruction depends on the *experience* of the Instructor. The following are responsible for the high standard of flying at the School:—H. D. Davis, A.F.C., Managing Director and Chief Instructor, E. A. Jones, C. M. Pickthorn, M.C., J. R. King, R. Y. Bush, who between them have done 14,250 hours' flying.

Ring up Byfleet 437 to fix a trial lesson—or write to

BROOKLANDS SCHOOL OF FLYING, BYFLEET • SURREY.

The Aerodrome is forty minutes from Waterloo. Five minutes' walk from West Weybridge Station. Trains every hour.

Entered as second class matter at the New York (N.Y.) Post Office.

ON AIRSHIPS.

When the R.101 came over London recently, probably twenty-five per cent. of the people who saw her said "Ooh-er!" twenty-five per cent. asked "What is the good of the thing?" and the remaining fifty per cent. either accepted it as a natural phenomenon, or simply did not think about it at all. The newspapers thought it was good copy, as there were no popular murders at the moment, but the nonsense which appeared in the papers bore no relation to the feelings of the Great British Public.

When the Chinese Government, in the days when China had a central Government at Pekin, thought they would have an Air Service, they borrowed an officer of the R.A.F. as Aeronautical Adviser. When the first machines arrived, one of them flew over Pekin, and the British officer, who was with a very important Chinese Mandarin, pointed up at it and said "Isn't it wonderful?" and the Mandarin replied unemotionally: "But why? It is *meant* to do that, is it not?"

That is to be highly recommended as the proper mental attitude to adopt towards these airships, about which there has been so much controversy lately. If they perform well, that is what they were meant to do. If they perform badly, then somebody has been stupid, which is equally natural.

If they make long voyages without accident, so much the better—that may be because of good engineering, or it may be because of skilful navigation, or it may just be good luck. If they are wrecked, as seems quite likely, all we can do is to hope that nobody will be hurt.

The great thing to remember is that in discussing airships we must be absolutely fair and impartial. Nobody really knows anything about airships yet. For the matter of that, nobody knows anything about aeroplanes, although quite a lot of them are being used. And airships are necessarily at least fifteen years behind aeroplanes in their development.

The Extremists.

The people who argue that airships are perfectly useless and are a disgraceful waste of the Taxpayers' money are just as much wrong as are the people who say that airships are the only possible solution of the problems of long-distance air transport.

Railways and motor cars both transport passengers and freight, and they both find plenty of work to do. Quite a good argument might be put up for the abolition of railways and for turning the tracks into great motor roads. On the other hand, an equally good argument might be put up for abolishing motor-cars and turning all the roads into electrified light railways.

As between airships and aeroplanes there is practically no fair basis of argument. The first Zeppelin was built somewhere about 1902. The first aeroplane flew in December, 1903, and so they both began about the same time.

Curiously enough, the first balloons were produced very much about the same time when Sir George Cayley was conducting his first experiments with gliders. So, both vehicles have existed for about the same time. But there is one very marked difference between them.

As was remarked in The Aeroplane a great many years ago, comparing the production of airships with the production of aeroplanes is unfair, because airships breed like elephants and aeroplanes breed like rabbits. An absolutely new type of aeroplane can be produced, if the builders really give their mind to it, in anything between six weeks and three months. An airship at best takes a year to build, and if it is going to be altered over and over again while it is being built, as these two ships of ours have been, it will take four or five years.

Developments.

Since people began to build aeroplanes which flew properly, which was about 1909, there have been, at quite a moderate estimate, eighty or a hundred generations of aeroplanes of perhaps twenty or thirty entirely different types. Since airships became practical vehicles, in the same year, there certainly have not been more than half-a-dozen distinct generations of airships, and there have only been three or four quite distinct types of them. In fact, one might say that there have only been three types—the non-rigid, the semi-rigid, and the rigid.

We may leave the non-rigid and semi-rigid types out of the argument, as they are not likely to develop much further, except for advertising purposes, or possibly for sport. Of the rigid ships, the Zeppelin of to-day is in its main structural features practically the same as the original

"AND SO I PENNED
"IT DOWN, UNTIL AT LAST IT CAME TO BE
"FOR LENGTH AND BREADTH, THE BIGNESS WHICH YOU SEE."

(*John Bunyan*, 1628-1688, born at Elstow, near Cardington.)

THE DESIGNERS' TRIUMPH.—R.101,—which, Lord Thomson states, has in every way fulfilled the intentions of her designers.

Digitized by Google

A PIONEER.—The Willows Airship, built by the late E. T. Willows at Cardiff in 1909.

Zeppelins. That is to say, it is built up of aluminium lattice-work, just as they were.

The war-time Zeppelins were all practically of the same type, and only developed in size and shape. Since the War, only two big Zeppelins have been built, the ZR3, which now belongs to the U.S. Navy and is called *The Los Angeles*, and the *Graf Zeppelin*, which has just made those remarkable voyages round the World. Our own war-time rigid airships were frankly copies of Zeppelins and, except in details of control mechanism and engine arrangements, were not original in any way.

The R.100 and the R.101 are definitely steps forward. R.100 is more like a Zeppelin than the R.101, but her main girders embody those ingenious helical tubes designed by Mr. Wallace, and there is a great deal of other original work in the ship. The design of R.101 is still more different from Zeppelin practice, because all the main girder-work which takes important stresses is made of steel, and the Zeppelin type of aluminium girder is only used to keep the outer envelope in shape, and for internal partitions.

Allowance for Experiment.

As these two ships both have so many original features, they must both be looked upon as entirely experimental. Consequently, to expect one of them to go to India and back and the other to go to Canada and back is trying them both rather high. If they do the journeys without accident, the designers and the constructors and the crew will deserve full credit for their success. If they are wrecked before they start nobody will have any cause to grumble, because pure experiments must be expected to wreck themselves.

To form some sort of just judgment about these airships we ought to look on them as being about the equivalent in development of the aeroplanes of 1911 which flew in the Circuit of Britain, or at best the equivalent of the aeroplanes of 1912, which flew in the Military Competition on Salisbury Plain and afterwards tried to perform usefully in the Army Manœuvres of the period.

Queer things used to happen to those aeroplanes. They used to get into unexpected spins, and they used to do queer uncontrollable dives, and tails used to break and wings used to come off, merely because we did not know enough about aerodynamics to be able to guard against these troubles. Even to-day, with nearly twenty years' more experience, we still make silly mistakes.

Our scientists publish learned articles on wing-flutter and tail-flutter, and while those articles are still the last word in scientific preaching, sometimes even while they are still in the printer's hands and have not been published, tails flutter off and wings do queer things which compel pilots to alight by parachute and join the Caterpillar Club. So all new types of aeroplanes, and a great many types which are "in production," are still really mere experiments.

For the matter of that, although we have had about

THE MOST SUCCESSFUL BRITISH AIRSHIP.—A War-time "Blimp,"—S.S.8 (Submarine Scout), of the type which did most of the anti-submarine patrols.

British Air Triumphs

1918 A Napier-engined D.H. aeroplane climbed to a height of 30,500 feet in 66 minutes. At this time no human being had ever soared so high.

1919 A Napier-engined D.H. aeroplane won the Aerial Derby. Speed 129·3 m.p.h.

1921 A Napier-engined Gloster aeroplane won the Aerial Derby. Speed 163·4 m.p.h.

1922 A Napier-engined Supermarine flying-boat regained the Schneider Trophy for Great Britain at a speed of 149 m.p.h.

1922 A Napier-engined Gloster aeroplane won the Aerial Derby. Speed 180 m.p.h.

1923 A Napier-engined Gloster aeroplane won the Aerial Derby. Speed 192·4 m.p.h.

1926 The first non-stop crossing of South Atlantic ocean carried out by Commandante Franco, flying a Dornier flying-boat with two Napier engines.

1926 First formation flight from Cairo to Cape Town and back to England. Four Fairey aircraft, each fitted with Napier engine, covered 56,000 engine miles without trouble.

1927 Schneider Trophy won by a Napier-engined Supermarine-Napier seaplane flown by Flight-Lieut. S. N. Webster, A.F.C. Speed 281·669 m.p.h. Only two machines completed the course, both Supermarine-Napier seaplanes fitted with Napier engines.

1927 World's speed record over 100 kilometres set up by Flight-Lieut. S. N. Webster, A.F.C. Speed 283·313 m.p.h.

1928 Flight-Lieut. D. D'Arcy Greig, D.F.C., A.F.C., flying Supermarine-Napier seaplane, fitted with Napier engine, set up speed of 319·57 m.p.h.

1928 Capt. H. S. Broad, flying D.H. Hound, fitted with Napier engine, secured three World's speed records whilst carrying loads of 500 and 1,000 kilogrammes.

1928 The greatest formation flight ever carried out was made with four Supermarine-Napier Southampton flying-boats, each fitted with two Napier engines. The machines flew from England to Australia, round Australia and back to Singapore, covering 180,800 engine miles without mechanical trouble.

1929 The first non-stop flight from England to India was carried out with a Fairey monoplane fitted with Napier engine. 4,130 miles in 50 hrs. 38 mins.

thirty years of motor cars, leading manufacturers of automobiles still produce cars with abominable steering, and employ scientists with the highest of brows to investigate mathematically the problems of wheel-wobble, tramping, gold-fishing, and other defects which do not exist in cars designed by men who do not calculate but merely know. That being so, how can we expect anybody to know anything about the aerodynamics of airships or aeroplanes?

Of course, we have quite a number of scientists, with as many academic letters after their names as are needed in describing the awards and decorations of a Field Marshall, who fondly imagine that they know all about the aerodynamic problems of airships. But, like specialists in every other walk of life, their claims to knowledge are very largely bluff. For you can always find two specialists or experts of equal standing, which means equally well advertised, who will contradict one another flatly on any subject under the sun.

Therefore, the only reasonable thing to do is to say that the people who have built these two airships have done their best. Some of them have had quite a good deal of experience of building airships. Some of them have quite a fair stock of common sense. And some of them may have that curious sixth sense, which is a kind of direct inspiration, which allows them to see things and know things without giving reason for the faith which is in them. And between the lot they may have produced ships which will turn out to be a remarkable advance on anything that has been built so far. Let us hope so.

Power-Plant Problems.

If we are going to look on these two ships as transport vehicles in which people are going to voyage round the World for pleasure as soon as they have done some trials in this country, we are merely being foolish. Regarded as completed jobs, each ship has in it a number of silly mistakes, which the designers themselves would freely admit if they saw fit to say exactly what they think.

Consider the engines alone. The R.100 has Rolls-Royce Condors of a type which are now practically obsolete. And, anyhow, the Condor was certainly not the best engine the Rolls-Royce Company have ever built. The new F type and H type Rolls-Royce engines are so far in advance of it that the makers themselves can freely admit the defects of the Condor. And, even admitting that the Condor was a good engine when it was first produced ten years ago, it is obviously out of date.

At the other extreme, the engines of the R.101 are purely experimental, and, as such, ought not to be trusted on a long voyage. They seem to have done good bench tests, and they seem to run all right in the ship. But they are still so far from coming up to the designers' expectations of the power which they would give for their weight that the ship is said to be between 20 and 25 tons over her designed weight simply because of the unexpected weight of the engines. And she is very much under her designed power.

That Idle Engine.

Added to this, there is that astonishing business of fitting one engine with an air-screw of reversed pitch—so that when the engine in that car goes ahead the air-screw pushes the ship astern. This means not only that the ship is short of the power of that engine when she is going ahead, but it means that the other engines have got all the work of pushing the whole of that idle power-egg (or gondola or car) through the air as so much useless drag, and the ship has to carry all that useless dead weight, just so that there may be a certain amount of power available to check the forward way of the ship when needed. Why on earth two of the engines were not fitted with ordinary reversing gears is difficult to understand.

To any normal intelligence, the whole idea of fitting entirely experimental engines into an entirely experimental ship was just about as silly a scheme as could be imagined. It is as bad as putting an untried engine of a new type into an aeroplane of an entirely novel type, and then expecting people to judge either the engine or the aeroplane on its merits, or to excuse the failure of either because of the novelty of both.

Considering that the whole ship is an experiment, the obviously sensible thing to have done would have been to fit her with engines whose power, weight, fuel-consumption and everything else were known to a nicety. Then the people who were running the ship could have got an exact

measure of the efficiency of the ship. Having discovered that much, they might then have fitted a couple of experimental Diesel engines just to find out what difference they made in the performance.

Naturally, the idea of using heavy-oil engines of the compression-ignition type is good. No stronger argument for the development of the compression-ignition engine have been published than those which have appeared in THE AEROPLANE. But to go and put into an experimental airship in which the interest of the whole world is centred engines which weigh 7lbs. per h.p. when the ship might have had engines which weighed less than 2lbs. per h.p. is merely silly.

THE TEST-BENCH IDEA.

If we are going to regard the whole ship purely as a sort of flying experimental-shop, well and good. But, if so, the Air Ministry ought to make quite clear to the Press the fact that no sort of a performance is expected from R.101, and that she will probably be wrecked in the course of the next few months either because her engines break down and she alights out of control, or because, owing to her being 25 tons over weight, she cannot carry enough ballast to save herself in a forced descent.

To let people think that she is going to take a hundred passengers to India in a month's time, or in three months, or six months, is simply humbugging the public—and ultimately the effect will be to make the Air Ministry look foolish.

In a letter to *The Times*, published on October 19, Mr. Alan Chorlton, who has been largely responsible for the Beardmore heavy-oil engine, says that the country ought to be proud of the achievments of R.101 already. One would like to ask Mr. Chorlton, why? He himself may well be proud of having produced a heavy-oil engine which runs—for one knows something of the difficulties he has had to overcome. But the country ought to be ashamed of putting such a contraption as R.101 into the air in this year of grace.

So far the ship has done nothing startling, and beyond the fact that the oil engines have run for a few hours without breaking down, and have managed to get the ship back to the mooring mast two or three times, they have done nothing beyond prove the fact that, as Mr. Wardrop said in the Kipling story, they turn round and they don't hit anything.

Until these engines have actually done something which could not have been done by any other engine, such, for example, as a long voyage on small fuel consumption, one

A FRENCH PIONEER.—The Clement-Bayard Airship of 1910.

cannot see why Mr. Chorlton should claim the congratulations of the nation.

Nobody is criticising his engines. Those of us who know anything about engines have a perfectly open mind about them. During the War Mr. Chorlton made some very good rotary engines to French designs, and quite possibly he may make some very good compression-ignition engines to British designs. But before hailing him as a national benefactor, we should all like to see those engines do something. And we should not be fair to the engines themselves if we expected them to put up a marvellous performance either in an experimental ship or while they are themselves experiments.

When Mr. Chorlton has produced his compression-ignition engines which, as he is fully confident, "will weigh only half the weight of those now in use," then his engines will deserve to be considered seriously. And if he can get them down to 2lbs. per h.p., he will certainly deserve public congratulations.

The Air-Shippers.

Meantime, those who are responsible for R.100 and R.101 deserve to be regarded as honest, straightforward experimenters to whom all of us should wish success. They may well achieve success ten or fifteen or twenty years hence, when they have had time to build a few more generations of airships. And we should all do our best to see that these experiments are kept going.

A lot of nonsense is being talked about the cost of these ships. Some papers have said that they cost a million pounds a-piece. Some papers have said that they cost two million pounds a-piece.

As a matter of fact, the Air Estimates show that the total amount spent on R.100 up to March 31, 1929, was £270,000, and that the total amount spent on R.101 (including all the overhead charges of the establishment at Cardington) amounted to £474,000.

To this latter sum, however, must be added £53,000 for the power plant. This last sum seems a good deal to pay for engines at 7lbs. per h.p.—though admittedly the Air Ministry is getting quite a lot of metal for its money.

When you divide this up among the five years in which the ships have been abuilding, you see that the British Empire has not been over-straining its financial resources in its effort to gain what may be very valuable knowledge. When you consider that the Royal Aircraft Establishment at Farnborough has been costing us £400,000 a year for about ten years, and still has not discovered how to make a compression-ignition engine, or how to stop wings or tails from fluttering off, or how to judge what kind of fuselage best fits certain types of wings, and has not induced the Trade to fit such obvious things as tail-wheels and brakes to aeroplanes—all of which means that we are not really any wiser for the four million pounds spent at Farnborough—nobody has any right to grumble at three-quarters of a million or so spent on experimental work on airships which may be extremely useful as transport vehicles ten or twenty years hence.

That Unfortunate Contour.

The worst trouble about airships is that so many people find difficulty in taking them seriously. One has always sympathised so deeply with that inhabitant of Yarmouth during the War 1914-18 who was prosecuted for pointing at an airship, while he was in a public place, and remarking: "There goes the Pulham Pig!"

"SOME THINGS ARE OF THAT NATURE AS TO MAKE "ONE'S FANCY CHUCKLE, WHILE HIS HEART DOTH ACHE."

ARMSTRONG WHITWORTH
AIRCRAFT

THE ALL STEEL ATLAS
(ON WHEELS, FLOATS OR SKIS)

THE all-steel Atlas is the best aircraft for land or sea reconnaissance.

It is the standard Army Co-operation two-seater of the Royal Air Force.

Its steel construction accounts for its unrivalled durability and ease of maintenance. Fitted with the world-famous Armstrong Siddeley Jaguar engine (plain or geared type), its speed, climb and ceiling fulfil the severest Service requirements. It is produced on the grand scale by the best equipped aircraft works in Europe.

AN EARLY BRITISH RIGID.—R.29,—built by Armstrong Whitworth Ltd. at Howden, where R.100 is being finished.

He was prosecuted under the Defence of the Realm Act for "Indicating the Destination or Station of Origin of one of His Majesty's Airships." Or something equally felonious. But one cannot help feeling that he was really prosecuted for insulting a ship of His Majesty's Navy—as the airships were in those days.

And yet, with the exception of those who are awed by sheer size, nobody can help being reminded of a performing elephant or a performing pig when he sees an airship cavorting about the skies. And one has never yet met a War-pilot of aeroplanes who did not feel, when called upon to attack an airship, that it was rather a shame to go and blow up such a poor helpless silly thing.

The time may come when war pilots will regard airships with more respect. The Air Staff is thinking quite seriously of the possibilities of big airships as aircraft-carriers, from which aeroplanes will be dropped, as a kind of counter to the seagoing aircraft-carriers from which, with luck, aeroplanes are launched or catapulted.

Also, the time may quite well come when we shall habitually make the longer journeys from England to Australia, or from England to New York, by the Grand Circle Route in an airship, leaving the aeroplane lines to run local traffic along the normal routes by land, or coastwise.

The Law of Speed.

But there is one fact which is worth considering in this connection. There seems to be a kind of natural law that the speed of the fastest practical aeroplane is always just about twice the speed of the fastest airship. Which means that on a given air-route, aeroplanes flying by day only can cover the same distance in a given number of days that an airship would cover flying steadily by day and night.

Therefore, when at last we have properly lighted air routes, and aeroplanes can fly by night as well as day, the aeroplane will always have a pull over the airship in the transport of mails, and of passengers who are really in a hurry.

When airships are fully developed, and when one can travel in them with as much confidence as we do in aeroplanes to-day, there will no doubt be quite a number of passengers who will prefer the peace and quiet of a voyage by airship to the inevitable racket of an aeroplane, and its constant frequent landings. But many years must pass before airships reach even that degree of safety.

The partisans of airships always rather spoil their case by claiming too much for their pet vehicle. Even to-day a good many aeronautical enthusiasts make claims for safety of transport by aeroplanes which certainly do not tally with the facts.

Only a few days ago at one of the many recent public functions, somebody who ought to have known much better said that air transport to-day is as safe as railway transport. That is sheer nonsense. The railways in the London area alone put up more passenger-miles per day than all the commercial aircraft in the World put up in a year. And quite often several days pass without anybody being killed on the railways in that area.

Quite possibly the time may come when airships will be safer than aeroplanes because they will not be compelled to alight when a few engines quit working. But if we are going to look sanely at the development of airships, we must be careful to regard R.100 and R.101 purely as experiments, and when they do wreck themselves, instead of bursting into floods of reproach or expressing bitter disappointment, we must simply hope that the people who are in the ship have learned something which will help towards preventing their next effort from wrecking itself.

The proper spirit is that shown by Mr. Koolhoven, when he built the World's first commercial aeroplane, the F.K.27, in 1919. One pointed out that by putting his passengers in front and perching his pilot up at the back, if there were a crash the pilot would be the sole survivor. "Then," said Mr. Koolhoven, "I shall get an intelligent explanation of why the accident happened."

The best way to make use of the £780,000 or so which has been spent on these ships in the last five years is to work them to death and find out what is going to break. But, as soon as ever they are both out of their sheds, work ought to begin on a couple of new ships, the designs of which could be based on all the lessons which the designers of both ships have learned in the past five years.

In fact, if we went about the job properly, we should start a couple of new ships every two years, so that in them could be embodied improvements based on what has been learned from the ships which would be already in the air, and those which were in process of building. Such a programme would only cost us just about the same amount of money that the Royal Aircraft Establishment at Farnborough costs us to-day, and the money would be well spent.—C. G. G.

THE GRAF ZEPPELIN.

The *Graf Zeppelin* left Friedrichshafen on the evening of Oct. 15 for a tour of the Balkans. The airship returned to its shed on the evening of Oct. 17 after a flight of 49 hrs. 20 min. During the trip the airship passed over Belgrade and Vienna.

THE SECOND TEST FLIGHT OF THE R.101.

The R.101 made her second flight on Oct. 18 when the Secretary of State for Air, Lord Thomson, was a passenger. The ship left Cardington at 08.00 hrs. and, besides Lord Thomson and his private secretary, Major Ll. Bullock, there were on board Mr. L. G. S. Reynolds (Air Ministry), Sq. Ldr. R. B. B. Colmore, Lt. Col. V. C. Richmond, Wing Cmdr. Cave-Browne-Cave, Sq. Ldr. Rope and Lt. Cmdr. Pressey, who is an officer of the R.C.A.F. With four other ranks this last-named officer is over here to learn mooring-mast routine, so that he may receive R.100 at the Montreal Mast, if and when called upon so to do.

During her cruise the ship passed over Northampton, Rugby, Coventry, Birmingham, Nottingham, Derby, Leicester and thence back to Cardington, which was reached at 14.15 hrs.

There was some delay in getting the ship down to the mast. This appears to have been due to the unsettled state of the air currents round the mast and to the fact that the mooring cable and the two side guys became entangled on being dropped from the ship. But most of the delay was caused by the skipper experimenting with the controls before mooring.

So far the controls have been manually operated as there has been no need to bring the servo-motor into action.

Mooring Out.

Oct. 20 was a day of heavy rainstorms and high winds which at times reached a velocity of 48 m.p.h. in the vicinity of the mooring mast at Cardington. The airship rode steadily at the mast-head through all these climatic disturbances.

Lord Thomson, Secretary of State for Air, opening a bazaar at Dewsbury on Oct. 19, said,

People are always asking me to give a name to R.101. I hope it will make its reputation with that name. If I know anything about the loyal crew who man it, it is that they would like to stick to "R.101."

BACK TO THE SHACK.

The Air Ministry issued the following announcement on Oct. 21:—

R.101 was moved from the mooring tower to the shed this evening shortly after 8 o'clock, as the meteorological conditions this afternoon indicated the possibility of strong, gusty winds to-morrow, and it was desired to complete as soon as possible certain work on the airship principally on the starting engines, in preparation for her full speed and other trials which have not yet been carried out.

[R.100 is alleged to be ready for her trials but as there is no mast at Howden she will have to fly straight to Cardington and be moored to the mast there. Presumably this impending arrival may have influenced the decision to re-shed the R.101 while the weather was sufficiently good for the operation.—Ed.]

THE ALL-METAL AIRSHIP.

As was recorded in The Aeroplane recently the ZMC-2 metal-clad airship built for the Navy by the Aircraft Development Corporation of Detroit has been duly delivered at the Lakehurst Naval Air Station.

According to the *American Metal Market* of Sept. 17, 1929, information made available by the Navy Department, U.S.A., states that the general theory of the metal-clad airship has been mathematically and experimentally proved, and the metal construction proves to be superior in every respect to fabric construction, whether the ships are filled with non-inflammable helium or with the more buoyant hydrogen. It has been determined that all-metal construction makes possible an actual reduction in weight compared with fabric construction, owing to the fact that the shell or hull-plating of the metal airship itself carries the tensile and shear stresses, and also reduces the amount of framing necessary.

The claim is made that in most practical sizes the metal-clad ship can be made approximately twice as strong as, and at the same time somewhat lighter than, the fabric-covered ship.

Increased safety and more positive control are said to be afforded by the range of safe internal pressure. The same ends are also served by the fact that the strong and stiff metal covering will not have a tendency to tear. There will be no soaking of rain water, and the highly conductant surface is favourable for the equalisation of temperature in the air.

These improvements mean that it can be handled in the air by half the usual crew for a ship of its size, and at the same time is under much better control. The ship is practically fireproof, and, in addition to its direct fire resistance properties, the metal cover makes the ship entirely immune from ordinary static discharges, and is practically lightning proof.

AIRSHIP DEVELOPMENT.

Things in the lighter-than-air trade seem to be looking up somewhat. Besides the R.100 and R.101, the Airship Development Co. Ltd. have turned out their little airship at Cramlington, and if they can run it cheaply enough they certainly ought to be able to get quite a handsome income from letting advertisement space on the envelope. They hope to have a second ship of similar type out before very long. Mr. R. F. Dagnall, of the R.F.D. Co. of Guildford, who is at present about the only manufacturer of lighter-than-air components in this country, says that he is building a second envelope for the Airship Development Co., and has just finished some kite balloons for the Air Ministry. Also, he is at work on three nurse balloons for the kite balloons.

AN HISTORIC INCIDENT.—An illicit photograph, taken by an enthusiastic amateur, of R.33 returning to Pulham after her famous breakaway from her mast. She was blown by a gale across the North Sea and over Holland. Thence, as the wind dropped, her commanding officer, Flt. Lt. Booth, drove her skilfully and carefully home,—conserving petrol and in continual danger of the broken nose crumpling back and wrecking the whole ship.—The emotion of the photographer accounts for "This Cock-eyed World."

NEXT WEEK—THE AIR PARK ISSUE.

Digitized by Google

FROM THE COMMERCIAL STANDPOINT THE "Bristol" JUPITER IS THE ULTIMATE AND THE WISEST CHOICE.

One of the most important matters for consideration when determining the aircraft suitable for commercial purposes is that of the power unit to be installed. The conditions of service, such as range of flight, climate, and the load to be carried are a few of the points that bear directly upon this decision—but at all times the reliability of the engine is of the utmost importance. General running costs and questions of maintenance cannot be isolated from the initial expenditure. The experience and records of existing airlines and other concerns operating aircraft must obviously be noted, and from such experience a ready choice may be made. The "Bristol" Jupiter is manufactured in a range designed to satisfy the most exacting circumstances. The Jupiter engine is in use on all the principal air lines in Europe and is used over four-fifths of the longest air line in the world.

THE PULLMAN OF THE SKIES

The Avro 10 is the British version of the Fokker F7-3M. It embodies all that is excellent in modern air travel, comfort, speed and great reliability under all climatic conditions. It is equipped with three 230 h.p. Armstrong-Siddeley engines and the whole machine is British built to the Air Ministry's standard of airworthiness. This type is used by the Dutch, Swiss, Italian and Canadian air lines and has recently been selected for passenger and freight service by Australian National Airways Ltd., who have ordered four Avro 10's for passenger and freight traffic on their Brisbane to Sidney route.

AVRO·10

Cruising speed 100 m.p.h. Range from 400 miles upwards.
Payload up to 2000 lbs.

Specifications and full particulars both of the above plane and of the Avro 5 (seating pilot and four passengers) will be supplied on application. Those interested should write also for special catalogue of the famous "Avian" light aeroplane.

SPREADING THE GOSPEL.

On Oct. 21 the Aviation Group of the Forum Club, the famous club for women in Grosvenor Place, held its Inaugural Dinner. The Honourable Lady Bailey, President of the Group, was in the Chair.

Opening the proceedings after dinner Lady Bailey said that there were 116 members of the Group, which had been formed to help the general interest in aviation. Lord Thomson's presence was a great encouragement to them, and they were also glad to welcome Sq. Ldr. Orlebar, Sq. Ldr. Jones Williams, Mr. and Mrs. Bentley and Mr. Barnard. Referring to Mr. and Mrs. Bentley, Lady Bailey remarked that they were "continually flying backwards." She was obviously going to say "backwards-and-forwards to the Cape," but everybody laughed so much that she had to explain that she did not really mean that they flew backwards as a habit.

LORD THOMSON, Secretary of State for Air, said that Lady Bailey herself was one of our greatest aviators, and remarked that her last flight had ended upside down in Germany. Fortunately for her a six-foot German arrived promptly and lifted the machine up so that Lady Bailey was able to climb down him. After which she was escorted to the local Burgomaster who took her name and address and allowed her to go home.

His own recent experiences in the air were in a branch of aeronautics which was not represented on the Club's Committee. He warned the heavier-than-air people that if present experiments with airships were half as successful as they promised to be we were going to see a form of travel with which no other could compare.

In the R.101 one travelled in a spacious saloon with a complete feeling of detachment and a sense of security and aloofness. One could work and smoke, and one was not conscious of any motion. And yet one felt air-borne in a curious way. One had no sense of speed. Things merely receded at between 40 and 70 miles an hour. Counties slipped by.

In the big cities, during the maiden voyage of R.101, those on board saw lines of people and cars standing still watching the ship. It was an experience like nothing else.

Admittedly the R.101 was an experiment. For five years the best brains available had been meditating on this problem. If they had merely wanted to imitate they could have had four or six ships two years ago. Actually no ship had been built expressly for passenger traffic until the *Graf Zeppelin*. In the war-machines built previously performance only had been considered.

In our new ships, R.100 and R.101, safety was the first consideration. Hence they were using heavy oil in R.101. Much had been sacrificed to the experiment, especially weight and load. R.101 was not the fastest ship, but she was the safest and the strongest. She was something in the nature of a portent.

He paid a high tribute to Dr. Eckener and his voyage round the World, but he said that the *Graf Zeppelin* could not be used in the Tropics because of the danger of the effect of the heat on petrol. [Here one begs to disagree. During the War a Zeppelin flew from Bulgaria over Khartum across the Equator to German East Africa with medical supplies to General Lettow von Vorbeck, and returned, without coming down low, because the captain received a wireless signal from Bulgaria saying that the German Forces in East Africa had already surrendered. And that ship got safely home.—C. G. G.]

Continuing, Lord Thomson said that he could foresee masts all over the World, at Australia and at India (where there is one already), at South Africa and at Canada (where there is one already). Airships, he said, would not be tied to rigid routes. One could imagine oneself travelling from Delhi to Chicago and thence to Melbourne. [Here at any rate is one who could not, especially remembering the dictum of Mr. Will Rogers, that the chief beauty of the American trans-Continental air-line was that one could go past Chicago without going into it.—C. G. G.]

Lord Thomson said that we were now experimenting with a form of travel which was of incalculable importance to the Empire. He had had the luck to persuade the Chancellor of the Exchequer five years ago to invest money in airships and he was sure that that money was not wasted.

Referring to R.101 he said how much he had been struck by the quiet but intense enthusiasm of the crew. As for the ship itself, all the designer's calculations had been justified. He reminded us that all ships had to "find" themselves, whether airships or sea ships. A member of the crew of the R.101, formerly a sailor-man, had said to him that there were some ships that you loved from the start and some you could care for, but they all loved R.101. Lord Thomson said that the most over-taxed of us would not grudge money for these ships.

R.101 was now back in her shed for modifications. She had not shown any serious defects. He reminded us that the *Mauretania* made several trips across the Atlantic before her designers discovered screws which fitted her. [Lord Thomson might also have reminded us that if the critics of the first great steamship, *The Great Eastern*, had been believed, we should never have had any *Mauretania* or any of our other great liners.] He had been thinking of offering a free flight to the critics of R.101, but he had come to the conclusion that the critical faculty was not to be encouraged. He hoped that next year the Forum Club would elect a lighter-than-air member to the Committee.

SQ. LDR. A. H. ORLEBAR, A.F.C., who was called upon to speak, said modestly that he thought he had been an extraordinarily lucky person this year. As he had been asked to express an opinion he said that he thought that aeroplanes were not so much of an experiment as airships, and that high-speed flying felt merely like flying. The pilot could not look down out of those high-speed machines so he got little impression of speed. The only novel impression was that approaching land seemed to loom up a bit quickly. But one soon got used to that.

Referring to the Schneider Trophy victory he said that we were frightfully lucky to have calm water and we were lucky in the wonderful design of our machines and engines. If the Friday or Saturday had been a bad day the great crowds would have got a very bad impression of aviation.

He told quite a delightful story of a little boy who on the Sunday after the Schneider Contest went to a Children's Service at Alverstoke. When he came back he was asked what he thought of it. He said that it was "not much fun, because the parson never once went into the cockpit."

A BRITISH TRI-MOTOR.—The three Genet-Major engines of the new Avro Five, built for Wilson Air Lines Ltd., of Nairobi, at Heston Air Park.—(*"Aeroplane" photograph.*)

Digitized by Google

In conclusion Sq. Ldr. Orlebar said how encouraging it was to hear the leader of our national air sense, Lord Thomson, when referring to mooring masts for airships, talk about masts *at* Australia, not merely at Perth or at Sydney or *in* Australia. It gave one the idea of the immensity of the scope of air transport.

Flt. Lt. R. R. Bentley, M.C., A.F.C., said that his last flight from Africa in a Moth was actually be his last, because, having seen the Schneider machines since then, he was convinced that he must really have been flying backwards. He said that his wife had made the journey with him twice (a remark which deservedly drew considerable applause). He said that Africa had a magic of its own and that the African route was definitely fascinating and that he felt honoured that he had had the opportunity of blazing that trail. (Mr. Bentley evidently agrees with Mr. Kipling on the subject of the magic of Africa.—C. G. G.)

Mr. C. D. Barnard said that he was ashamed to talk about flying to India in front of Sq. Ldr. Jones Williams, but he understood that that officer was adamant on the subject of making a speech. His own flight to India and back had been quite easy, though he admitted that when airships were safe they might be preferable to taking off and landing a heavily loaded aeroplane. He said that he was now trying to persuade the Duchess of Bedford to fly to the Cape and back in fourteen days.

Apropos nothing in particular, he told a story which was certainly new to the present writer. A certain man had gone joy-riding at Margate with a pilot who was feeling somewhat elated. After looping low down over the town and performing a variety of stunts the pilot climbed up high, shut off his engine and remarked to the passenger "Fifty per cent. of the people down there thought that we were going to crash." To which the passenger replied "And so did fifty per cent. of the people up here."

The Honourable Mrs. Forbes-Sempill, proposing the Guests, said that she was specially privileged to welcome Lord Thomson, who after all his experiences in the air now seemed to aspire to be an intrepid mountaineer and conquer Snowden. She said that she was glad to pay a tribute to those in the Service who had done so much for aviation.

Lieut.-Colonel N. G. Thwaites, C.B.E., M.V.O., M.C., Secretary of the Air League, complimented the Aviation Group of the Forum Club on their success and loyally acknowledged that his former chief General Groves had originated the idea of forming the Group. He reminded us how much women had had to do with the development of aviation, and remarked that he could not recall that women had had anything to do with the development of sea transport, with perhaps the exception of Grace Darling. Nor could he remember that women had much to do with the development of motoring. [Here Col. Thwaites is wrong. Miss Dorothy Levitt was one of the finest drivers on the road when there certainly were not more than a dozen first-class racing drivers in this country. Apart from that, woman, rather than any particular women, has been the making of motoring. As soon as any man acquired a motor vehicle of any kind he becomes fair game for a designing female.—C. G. G.]

Unfortunately lack of space forbids reporting the rest of Col. Thwaites' speech, which was quite one of the wittiest that one has heard for a very long time, but had surprisingly little to do with aviation. As Col. Thwaites failed to get into Parliament as a Conservative one strongly recommends Lord Thomson to enrol him as a Labour member.

Col. the Master of Sempill proposed the health of the President of the Aviation Group, Lady Bailey. He said that as a pilot she was unrivalled even in such a gathering. But he reminded us that without Miss Alice Williams who was the mainstay of the whole Club there would have been no Club to form the Group.

Lady Bailey having suitably acknowledged the compliment the party broke up and talked aviation till midnight. One hopes that they will spread abroad all that they heard.—C. G. G.

A JUNKERS IN ABYSSINIA.

A Junkers W33 (of the same type as the *Bremen*) with a Junkers L5 engine recently arrived in the Abyssinian capital, Addis Ababa, when it was greeted with much enthusiasm.

The Junkers press notice which conveyed this information states that "King Ras Taffari cabled his joy and satisfaction to Professor Junkers"!

A NEW POWER IN AVIATION.

Statements have appeared in various papers that Sir Henry Segrave has resigned his connection with the Red Triangle Cement group, and has accepted a seat on the board of a big financial group in the City of London which is concerning itself with aviation.

The Aeroplane is happily able to confirm this statement on the authority of Sir Henry Segrave himself.

Unfortunately, at the moment a disclosure of the composition of this particular group is not advisable. But one can say that this combination is the biggest thing that has ever happened in British Aviation.

Knowing something of the financial interests concerned, one can almost agree with a remark made about the same group some few weeks ago to the effect that they could buy up the whole of the British Aircraft Industry without worrying themselves. But one can assure the British Aircraft Industry that the said group is not the least likely to do any such thing. It is much more likely to develop along its own lines. And quite a high proportion of the Aircraft Industry will probably feel the cold unless they wake up and make what the market wants.

The enlistment of Sir Henry Segrave as technical adviser is one of the wisest things that this group could have done. People are apt to forget that although Sir Henry made his name among the newspaper-reading public of the World as a driver of high-speed motor-cars, and was deservedly knighted for upholding the prestige of Great Britain as he did, he is primarily an aviator.

He did between 1,200 and 1,500 hours' flying during the War and was one of the finest single-seat pilots in the R.F.C. and R.A.F. Towards the end of the War he was badly crashed and lost about half of one leg, with the result that, though he can drive a car, and can still fly well, he cannot do anything athletic. After recovering from his crash he went to America on a special mission for the Air Ministry, which had then only just come into being, and there proved that he possessed the qualities of a diplomat as well as being a fine pilot.

Although he went into the motor business to make a living after the War he has never lost his interest in flying, and has always kept his ideas thoroughly modernised. Consequently, though there are a good many people in the Aircraft Industry who do not know Sir Henry Segrave personally, there are very few people in the Aircraft Industry about whom Sir Henry Segrave does not know a good deal.

His return to an active part in British Aviation, together with the power of the money which can be used by the group with which he is connected, is one of the healthiest happenings to British Aviation for a very long time.—C. G. G.

THROUGH THE SNOW AND ICE.

The *Berliner Tageblatt*, the great German newspaper, alleges that a scheme is afoot to link Canada and Great Britain by an air route across the Faroe Islands, Iceland, and Greenland, to Northern Canada. Negotiations are alleged to be proceeding between a Canadian air line company and Imperial Airways Ltd., represented by Sir Eric Geddes.

The scheme is stated to comprise air bases in the Faroes and Iceland with emergency depots along the southern shore of Greenland.

Trans-Arctic routes have certainly many advantages and offer the shortest Great Circle routes between a number of places as well as providing short hops instead of colossal leaps across the wastes of the Atlantic.

—The Avro Five (pilot and four passengers) with three Genet-Major engines,—and s,—flying at Heston Air Park. —("Aeroplane" photograph.)

LODGE PLUGS LIMITED RECEIVED 10 SEP 1929 RUGBY

Messrs. Lodge Plugs Ltd.,
Rugby.

Dear Sirs:

We wish to congratulate you on the success of your plugs fitted to the Rolls-Royce engines in Supermarine S.6 in the Schneider Trophy Race, and also to the machine which holds the world's record for speed.

Lodge plugs were used in both Schneider Trophy machines with our engines.

Our decision to use Lodge plugs was only arrived at after exhaustive tests at Derby; and during the actual Race and on all the practice flights we had no troubles.

We thank you for the assistance you gave us.

Yours faithfully,

For ROLLS-ROYCE LIMITED

Managing Director.

THE ROYAL AIR FORCE.

The London Gazette.

October 15.

ROYAL AIR FORCE.

GENERAL DUTIES BRANCH.—Air Commodore W. G. S. Mitchell, C.B.E., D.S.O., M.C., A.F.C., is appointed Director of Training, Air Ministry (Oct. 4).

D. H. F. Barnett is granted a perm. comn. as a Plt. Off. with effect from Oct. 5, and with seniority of Oct. 5, 1928; Flt. Lt. J. C. E. A. Johnson is granted a perm. comn. in this rank (Oct. 1).

Major V. M. Kenny-Leveck, M.B.E. (R.A.R.O.) is granted a S.S. comn. as a Flt. Lt. (Hon. Sq. Ldr.) for three years on the active list (Sept. 30); C. I. Sempill, M.M., is granted a S.S. comn. as a Flg. Off. for three years on the active list (Sept. 30).

The following Lieutenants are granted temp. comns. as Flg. Offs. on being seconded for duty with the R.A.F. (Oct. 1):—A. O. Simpson (R.A.); E. O. Wanliss (E. Lancs. Regt.); E. A. Airy (The Buffs).

The following are re-attached to the R.A.F. as Flg. Offs. with seniority of June 16, 1924:—Lt.-Cdr. I. R. Grant, R.N. (Sept. 29); Lt. H. Ditton, R.N. (Oct. 7).

Flg. Off. A. R. Perry is placed on the retired list on account of ill-health (July 6); Capt. J. M. Fuller, R.M., Flg. Off., R.A.F., ceases to be attached to the R.A.F. on return to naval duty (Oct. 12); the S.S. comn. of Plt. Off. on probation A. R. MacKewn is terminated on cessation of duty (Oct. 16).

RESERVE OF AIR FORCE OFFICERS.

GENERAL DUTIES BRANCH.—H. G. Watkins is granted a comn. in Class A.A. (ii) as a Plt. Off. on probation (Sept. 30); Plt. Off. on probation A. D. Moore is transferred from Class A.A. (ii) to Class C (Jan. 12); Flg. Off. G. F. E. Harrison relinquishes his comn. on completion of service (Feb. 4); Flg. Off. L. R. Mizen relinquishes his comn. on appointment to a comn. in the Indian Army (Sept. 20); Flg. Off. D. H. P. Barnett relinquishes his comn. on appointment to a perm. comn. in the R.A.F. (Oct. 5).

AUXILIARY AIR FORCE.

ACCOUNTANT BRANCH.—No. 600 CITY OF LONDON (BOMBER) SQUADRON.—The following to be Plt. Off.:—R. Hiscox (Aug. 3).

Appointments.

Week ending October 21.

GENERAL DUTIES BRANCH.—Group Captains F. E. T. Hewlett, D.S.O., O.B.E., to R.A.F. Training Base, Leuchars, to command, 7/9. R. J. Bone, C.B.E., D.S.O., to R.A.F. Depot, Uxbridge, on transfer to Home Establishment, 18/8.

Wing Commanders F. W. Stent, M.C., to H.Q., A.D.G.B., Uxbridge, for Air Staff duties, 7/10. R. G. D. Small, to H.Q., Fighting Area, Uxbridge, for Air Staff duties, 18/9. W. B. Callaway, A.F.C., to H.M.S. *Furious*, for duty as Senior Air Force Officer, 7/9.

Squadron Leaders W. H. Dunn, D.S.O., to H.M.S. *Vindictive*, 26/8. H. H. James, O.B.E., to R.A.F. Depot, Uxbridge, 31/8. H. S. Scroggs, to R.A.F. College, Cranwell, 3/9. D Iron, O.B.E., to R.A.F. Base, Gosport, 23/9. R. F. S. Leslie, D.S.C., D.F.C., A.F.C., to Home Communication Flight, Hendon, 16/9. J. S. T. Fall, D.S.C., A.F.C., to Superintendent of R.A.F. Reserve, Hendon, 26/9. T. P. Y. Moore, to H.Q., Fighting Area, Uxbridge, 29/5. L. T. Keeble, to R.A.F. Depot, Uxbridge, 17/8.

Flight Lieutenants T. S. Horry, D.F.C., A.F.C., to No. 22 Sqdn., Martlesham Heath, 1/10. J. M. Glaisher, D.F.C., to No. 56 Sqdn., North Weald, 1/10. W. Badley, to No. 1 F.T.S., Netheravon, 7/10. F. G. Cater, to A. and G. School, Eastchurch, 24/9. B. T. Hood, to No. 9 Sqdn., Manston, 1/10. C. J. Collingwood, to No. 23 Group H.Q., Grantham, 2/9. P. J. R. King, to Cambridge University Air Sqdn., 8/10. H. D. O'Neill, A.F.C., to No. 100 Sqdn., Bicester, 8/10. G. A. Simons, to R.A.F. Depot, Uxbridge, 6/7. R. C. Savery, D.F.C., to R.A.F. Depot, Uxbridge, 26/9. G. Y. Tyrrell, M.C., to H.Q., Wessex Bombing Area, Andover, 16/9. F. R. Wynne, M.B.E., to School of Army Co-operation, Old Sarum, 23/9. J. I. T. Jones, D.S.O., M.C., D.F.C., M.M., to Experimental Section, Royal Aircraft Establishment, S. Farnborough, 18/9. A. King-Lewis, to Coastal Defence Co-operation Flight, Eastchurch, 24/9. H. E. Forrow, to No. 12 Sqdn., Andover, 13/9. F. K. Damant, D.F.C., to No. 5 F.T.S., Sealand, 27/9. H. S. Broughall, M.C., D.F.C., to No. 22 Sqdn., Martlesham Heath, 18/9. C. T. Walkington, to No. 43 Sqdn., Tangmere, 29/8. E. D. H. Davies, to School of Naval Co-operation, Lee-on-Solent, 14/9. F. W. Long, to M.A.E.E., Felixstowe, 18/9. G. A. R. Muschamp, to No. 10 Sqdn., Upper Heyford, 3/9.

Flying Officers J. H. Sender, to No. 5 F.T.S., Sealand, 25/9. D. A. Boyle, to No. 601 Sqdn., Hendon, 5/10. F. J. P. Dewhurst, to No. 16 Sqdn., Old Sarum, 3/9. A. J. W. Geddes, to No. 4 Sqdn., S. Farnborough, 3/9. M. Brunton, to No. 25 Sqdn., Hawkinge, 17/9. A. V. Harvey, to No. 602 Sqdn., Glasgow, 13/9. E. A. T. Murray, to No. 15 Sqdn., Martlesham Heath, 30/9. P. Hill, to No. 58 Sqdn., Worthy Down, 16/9. R. J. A. Ford, to No. 15 Sqdn., Martlesham Heath, 25/9. J. McGuinness, to No. 13 Sqdn., Netheravon, 8/10. J. H. Lindell, to R.A.F. Depot, Uxbridge, 1/10. C. A. Bell, to Cambridge University Air Sqdn., 8/10. R. O. O. Taylor, to No. 33 Sqdn., Eastchurch, 23/9. A. L. T. Naish, to A. and G. School, Eastchurch, 3/10. V. Harris, to No. 99 Sqdn., Upper Heyford, 11/10. C. H. A. Colman, to A. and G. School, Eastchurch, 17/9. J. E. Allen, to No. 15 Sqdn., Martlesham Heath, 3/10. C. C. Edwards, to No. 4 Sqdn., Northolt, 6/10. W. J. P. Sloan, to No. 33 Sqdn., Eastchurch, 3/10. E. J. Ellis, to R.A.F. Depot, Uxbridge, 31/8. V. J. Sofiano, to R.A.F. Depot, Uxbridge, 8/9. E. A. Airey, A. O. Simpson and E. O. Wanliss, to No. 5 F.T.S., Sealand, on appointment to Temp. Comns., 1/10.

Pilot Officers J. D. Roden, to R.A.F. Depot, Uxbridge, 3/9. R. J. T. Barrett, to No. 43 Sqdn., Tangmere, 3/10. J. Cherrill, to No. 111 Sqdn., Hornchurch, 3/10. T. Gadd, to No. 41 Sqdn., Northolt, 3/10. R. P. Garnons-Williams, to No. 23 Sqdn., Kenley, 3/10. C. R. J. Hawkins, to No. 207 Sqdn., Eastchurch, 8/10. M. T. M. Hyland, to No. 35 Sqdn., Bircham Newton, 3/10. J. O. H. Lobley, to No. 33 Sqdn., Netheravon, 3/10. B. A. Oakley, to No. 35 Sqdn., Bircham Newton, 3/10. J. D. H. Slade, to No. 35 Sqdn., Bircham Newton, 3/10. J. R. Stebbing, to No. 56 Sqdn., North Weald, 3/10. A. T. Wilson, to No. 32 Sqdn., Kenley, 3/10. A. N. I. Worger-Slade, to No. 207 Sqdn., Eastchurch, 3/10. C. Sarsfield-Sampson, to No. 70 Sqdn., 'Iraq, 13/9. A. G. Adnams, to No. 10 Sqdn., Duxford, 3/9. A. F. P. Anning, to No. 26 Sqdn., Catterick, 3/9. B. A. Blythe, to No. 3 Sqdn., Upavon, 3/9. A. L. Brain, to No. 26 Sqdn., Catterick, 3/9. C. M. D. Chamber, to No. 111 Sqdn., Hornchurch, 3/9. C. M. Champion de Crespigny, to No. 4 Sqdn., S. Farnborough, 3/9. G. H. Clarks, to No. 25 Sqdn., Hawkinge, 3/9. H. R. Collins, to No. 13 Sqdn., Andover, 3/9. E. W. Downing, to No. 32 Sqdn., Kenley, 3/9. H. A. Fenton, to No. 4 Sqdn., S. Farnborough, 3/9. H. R. Hughes-Hallett, to R.A.F. Base, Calshot, 3/9. A. E. Louks, to No. 29 Sqdn., North Weald, 3/9. D. S. McDougall, to No. 23 Sqdn., Kenley, 3/9. F. A. McNeill, to No. 13 Sqdn., Andover, 3/9. G. O. St. J. Morris, to No. 111 Sqdn., Hornchurch, 3/9. K. W. Pell, to No. 2 Sqdn., Manston, 3/9. A. F. Powell, to No. 13 Sqdn., Andover, 3/9. R. A. R. Robinson, to No. 41 Sqdn., Northolt, 3/9. L. P. Rowley, to No. 32 Sqdn., Kenley, 3/9. J. S. Shakespeare, to No. 26 Sqdn., Catterick, 3/9. H. B. Collins and G. C. Holland, to No. 5 F.T.S., Sealand, on appointment to Perm. Comns., 28/9. The under-

"FAREWELL, A LONG FAREWELL TO ALL MY GREATNESS."—This picture of a machine of No. 208 (Army Co-operation) Squadron, R.A.F., is positively the last photograph of a Bristol Fighter which will be published in "The Aeroplane."

mentioned Pilot Officers are posted to No. 5 F.T.S., Sealand, with effect from 28/9:—A. G. Adnams, S. H. Bell, D. P. A. Boitel-Gill, J. C. L. Bruce, R. R. Chapman, L. E. Chiswell, G. B. S. Coleman, C. R. Davies, J. L. M. Davys, S. W. H. Egan, G. Egerton-Hine, T. N. Fraser, J. S. Hamilton, C. J. Hansford, J. N. Hepworth, L. M. Hooper, R. G. Hosken, N. C. Hyde, B. N. Matson, L. R. Mouatt, E. E. Noddings, R. C. Parker, I. N. Roome, K. N. Sayers, G. D. Seabourn, M. W. Simons, S. D. Slocum, J. A. MacD. Teacher, H. J. Ward, C. A. Washer, H. J. Wilson.

Medical Branch.—Flight Lieutenants C. W. Coffey, to No. 4 Sqdn., S. Farnborough, 21/9. E. K. T. McWeeney, M.B., to Palestine General Hospital, 30/8. E. P. Carroll, to Palestine General Hospital, 30/8. F. P. Schofield, M.C., to R.A.F. Officers' Hospital, Uxbridge, 1/10.

Flying Officer G. W. Paton, M.B., to Palestine General Hospital, 30/8. The undermentioned Flying Officers are posted to the Medical Training Depot, Halton, on appointment to S.S. Comns., with effect from 1/10:—J. J. Corcoran, M.B., C. C. Fenton, M.B., B.S., B.Sc., C. G. Harold, M.B., A. Sheehan, M.B., D. D. Watson, M.B., E. A. Wilson, M.D.

Stores Branch.—Flight Lieutenants H. Parker, to R.A.F. Depot, Uxbridge, 27/9. A. H. Allan, to H.Q., Wessex Bombing Area, Andover, 21/9. V. B. Ranford, to Station H.Q., Heliopolis, Middle East, 28/9.

Flying Officer M. H. Jenks, to No. 101 Sqdn., Bircham Newton, 26/9.

Accountant Branch.—Squadron Leader C. C. J Croydon, to Station H.Q., Andover, 1/10.

Flying Officer H. C. Bakes, to No. 1 School of T.T. (Apprentices), Halton, 1/10.

Chaplains Branch.—The Rev. F. G. B. Sutherland, R.A.F. Depot, Middle East, 10/9. The Rev. C. P. N Rowband, to R.A.F. Base, Gosport, on appointment to a S.S. Comn., 6/9. The Rev. S. H. Keen, to H.Q., R.A.F., Halton, on appointment to a S.S. Comn., 12/9.

An Air Display at Constantinople.

A display of flying by the R.A.F. Units in H.M.S. *Courageous*, which has been visiting Turkey, is described in *The Times* of Oct. 19 by that paper's correspondent at Constantinople. The writer states that this was the first time that the Fleet Air Arm, operating from an aircraft-carrier, has provided a pageant on such scale for the benefit of a foreign Power. But there are those who will remember a "pageant" on even a bigger scale which was arranged over Constantinople some few years ago by Group Capt. Peregrine Fellowes and General Harrington.

The account of the latest display reads:

Early this morning the *Courageous*, which had been lying at Moda, steamed at high speed into the Sea of Marmora. The weather was beautiful and as there was hardly any wind she was obliged to steam at full speed in order to facilitate the taking off of the aeroplanes from her deck. Just before 10 o'clock the air pageant, which was co-ordinated under Captain H. J. S. Brownrigg, of H.M.S. *Courageous*, and Wing Commander R. Collishaw, started. Punctually to the minute at 10 o'clock the first aeroplanes appeared over Constantinople. One wing, consisting of nine Darts, torpedo-bombers with 470 h.p. Napier Lion engines, 12 Fairey Flycatchers, with 330 h.p. Jaguar engines, and nine Fairey III.F, with 470 h.p. Napier Lion engines, took part in the pageant.

The aeroplanes, flying in three formations, passed over the Galata Tower simultaneously at heights of 2,000, 2,500, and 3,000 ft. respectively, and then separated. They then crossed over in squadron formation, afterwards in V formation, and finally in line abreast. Only a few yards separated each machine during these flights, and the precision with which the three squadrons carried out various manœuvres was remarkable.

At 10.15 the Darts formed a large circle extending from the Golden Horn to the *Queen Elizabeth*, from which Admiral Sir Frederick Field, the Commander-in-Chief, was watching the display. As soon as the circle had been formed the Flycatchers corkscrewed downwards through the circle of Darts. This exercise was admirably executed and made a very pretty sight. After that three Flycatchers, led by Flg. Off. G. H. Birley, gave a display of aerobatics.

At 10.40 the 30 machines assembled, and, after forming flights in line astern, made slow dives over the Golden Horn before flying past the *Queen Elizabeth*.

The last item of the pageant was most impressive and entirely original. The Crescent and Star of the Turkish flag was pictured in the sky. The Crescent was formed by 15 machines, and one represented the Star. Assuming this formation some three miles from Constantinople, the 16 machines flew in perfect formation over the city, and finally disappeared over the Asiatic shore *en route* for the *Courageous*. This compliment to Turkey awoke great enthusiasm among the huge crowd which was watching the display.

Royal Pilots.

H.R.H. the Prince of Wales and H.R.H. Prince George both had over an hour's dual instruction in D.H. Moths at Northolt aerodrome on Oct. 16. The Prince of Wales used his own machine and Mr. Fielden was his instructor. Prince George was in a machine lent by the De Havilland Company and flown by Sq. Ldr. Don.

The Staff College, Camberley.

The following officers of the R.A.F. have received nominations to the Staff College, Camberley, for the course beginning in January, 1930:—Wing Cdr. R. P. Willock and Sq. Ldr. R. D. Oxland, O.B.E.

A West African Service Flight.

A *Reuter* message dated Oct. 20 states that the R.A.F. West African Flight of three Fairey IIIF machines took off from Helwan on Oct. 19 for a flight to Nigeria and the Gold Coast.

The Squadron stationed at Helwan is No. 45 (Bomber) Squadron, which, according to the current Air Force List is equipped with D.H.9as. Presumably the Squadron has been re-equipped with Fairey IIIFs.

An Award for Gallantry.

The London Gazette of October 18 announced that His Majesty the King has approved the award of the medal of the Military Division of the Order of the British Empire to Flt. Cadet William Neil McKechnie, Royal Air Force, for gallantry.

On June 20, 1929, an aeroplane piloted by Flt. Cadet C. J. Giles crashed on landing at Cranwell Aerodrome and burst into flames. The pilot was stunned, but managed to release his safety belt and fall out of the machine in a dazed condition.

Flt. Cadet McKechnie, who had landed in another aeroplane about the same time some 200 yards away, left his machine and ran at full speed towards the scene of the accident. The petrol had spread over an area of about ten yards diameter in full blaze, with Giles lying in it, semi-conscious.

McKechnie, without hesitation, ran into the flames and pulled out Giles, who was badly burned about the legs and face, with his Sidcot suit and clothes actually burning. After dragging him clear of the flames, during the process of which he was scorched and superficially burned, McKechnie proceeded to extinguish the flames of Giles's burning clothing.

By this time the machine was in full blaze, with the petrol spreading along the ground, so that without McKechnie's assistance there is no doubt Giles would have been burned to death, as he was quite incapable of moving himself. Ultimately the machine was entirely destroyed by fire, and the ground for some distance around was completely burned up by the spread of the ignited petrol.

No. 205 (Flying Boat) Squadron.

An Air Ministry Order states that the address of No. 205 (Flying-Boat) Squadron, R.A.F., is:—Royal Air Force Base, Singapore, Straits Settlements.

Engineers and the R.A.F.

Replying to the toast of "The Royal Air Force" at the annual dinner of the Institution of Mechanical Engineers in London on Oct. 17, Lord Thomson, Secretary of State for Air, spoke of the close association between the R.A.F. and the work of the Institution of Mechanical Engineers.

He said that reference had been made to publicity but he had never been conscious of R.A.F. publicity except from the point of view that they had many critics. He thought it was fair to say that 70 per cent. of the publicity given to the Air Force was due to hostile criticism. The young men over whose work he presided led perilous lives. They had been very much in the public eye this year because of certain magnificent opportunities. The Air Force did not seek publicity. It was essentially a technical profession and every member of it had to be a skilled technician. High courage and extreme skill was absolutely essential for the efficiency of the Force.

Referring to the airship R.101 he said that Mr. Chorlton (Vice President of the Institution of Mechanical Engineers) had been working with the Air Ministry for months in connection with the engines. The speaker had been told by experts that these engines had more than surpassed their expectations and that this country had given a lead to the whole world in using a fuel with a flash point of 215 deg. Fah. which flowed satisfactorily at 1 deg. Fah. which, for the same weight, gave 26 per cent. more range to the airship and a cost of one-fifth of the price of petrol.

Extensions of Service.

The service of the following officers of the Reserve has been extended as indicated:—

For Five Years.—*Class A*: Flg. Offs. W. R. Bannister, J. R. Foster, D. P. Jones, S. F. Woods, R. E. La F. Wyatt.

Class C: Flg. Off. S. A. Dismore.

For Four Years.—*Class A*: Flg. Offs. F. J. Brunton, F. J. E. Feeny, D.S.O., F. J. Islip, D. Page, M.M.

Class D.1.: Flt. Lt. J. A. Quin, M.D., B.A.

For Three Years.—*Class A*: Flg. Off. C. M. Willy.

For Two Years.—*Class A*: Flg. Offs. A. M. Diamant, J. J. Scholes.

For One Year.—*Class A*: Flt. Lt. M. D. Barber; Flg. Offs. H. C. Cooke, H. E. Greenberry.

Modern Languages.

The following officers and airmen passed the examinations in modern languages held in June, 1929, at the centres stated:—

London.

French.—(*Preliminary*): Flt. Lt. G. N. P. Stringer, D.F.C.; Flt. Lt. E. B. Addison; No. 509443 AC.2. R. L. Deadman.

(*Interpreter (2nd Class)*): *Sq. Ldr R. L. G. Marix, D.S.O.; Flt. Lt. F. Beaumont; Flt. Lt. G. A. R. Muschamp; Flt. Lt. C. R. Davidson, M.C.; *Flt. Lt. P. R. Chamberlayne, A.F.C.; *Flg. Off. M. H. Jenks; No. 335556 L-AC. H. Masse.

Arabic.—(*Preliminary*): *Flg. Off. V. Harris.

Middle East.

French.—(*Preliminary*): Flg. Off. S. C. George; No. 355960 Cpl. J. E. Ann.

German.—(*Interpreter (2nd Class)*): Flt. Lt. A. Rowan.

Arabic.—(*Preliminary*): *Flt. Lt. E. V. Humphrey; No. 363887 L-AC. W. J. Ashbee; No. 355048 L-AC. A. V. Conway.

(*Colloquial*): Flt. Lt. E. V. Humphrey; *Flt. Lt. J. J. Lloyd Williams, M.C., *p.s.a.*; *Flg. Off. C. S. Cadell; *Flg. E. A. Burridge; No. 355576 Sjt. J. Thom; No. 362704 L-AC. A. S. W. Thorpe; No. 363887 L-AC. W. J. Ashbee; No. 362394 L-AC. E. A. Hickman; No. 355048 L-AC. A. V. Conway.

'Iraq.

Arabic.—(*Colloquial*): No. 354438 AC.1. A. Winwood.

NEXT WEEK—THE AIR PARK ISSUE.

Digitized by Google

MALTA.

FRENCH.—(*Preliminary*): Wing Cdr. H. B. Porteous, M.B., D.P.M., D.P.H.; No. 505638 AC.2. H. F. Simpkins; No. 363225 AC.1. J. A. McKinnon.

INDIA.

BRITISH SERVICE OFFICERS' URDU TEST.—Flt. Lt. E. C. de V. Lart (July 2, 1928).

FRENCH.—(*Preliminary*): Flg. Off. A. J. L. Hughes.

The awards payable under King's Regulations will be issued to the officers marked *.

Specialisation of Short-Service Officers.

The following Flying Officers (short-service) of the General Duties Branch have been accorded permission to sit for the examination to be held in December, 1929, for specialisation:—

Air Defence of Great Britain:—Barwell, P. R.; Bruce, J. D. F.; Elton, J. G.; Loch, H. G.; Miller, A. P.; Nicholas, B. D.; Stevens, A. M.; Turner-Hughes, C. K.; Tuttle, G. W.

Inland Area:—Abraham, T. M.; Donkin, R. H.; Mason, L. H.; Morshead, V. D.; Netherton, K. C.; Powell, G. J.; Walker, G. H.; Weighill, G. R.

Coastal Area:—George, E. J.

Middle East:—Calwell, A. K. K.; Clark, R. W. M.; Edwards, R. C.; Gibbon, D. W.

'Iraq Command:—Evans, C. H. L.; Fairhead, F. G.; Mackay, U. S.; Walker, H. J.

India:—Ashton-Jinks, C. P.; Bradley, P. F. G.; Collings, R. W. P.; Ferrier, F. G.; Keens, L. T.; Jenkins, G. H. G. S.; Merrett, T. K.; Monro-Higgs, W. R.; Russell-Stracey, E. G. H.; Spittle, W. R. J.; Stroud, R. W. A.

Mediterranean:—Hatcher, V. G. A.; McNeil, W. C.; Russell, E. G. L.

Aden Command:—Allen, A.

Rugby Football at Cranwell.

A match between the R.A.F. College, Cranwell, and a team of Old Cranwellians was played at Cranwell on Oct. 16. The College won by five placed goals and a penalty goal and a try (31 points) to two placed goals and a dropped goal and a try (17 points).

The Cadets were playing their third match of the season and thus, to a certain extent, they had an advantage over their opponents. On the other hand their training has been seriously interrupted by the hard state of the ground and consequent casualties. Considering these handicaps the Cadets put up a remarkably fine show and thoroughly deserved their victory. They were fast, fit, and well together.

The Old Cranwellians were an opposition not to be despised. The R.A.F. team of last season was represented, and also several of the first class Rugger clubs, including the Harlequins, the London Scottish and Leicester. They improved, as a team, as the game went on but they never had quite the same amount of thrust nor the same close follow-up as the Cadets.

The Old Cranwellians opened the scoring after a quarter of an hour of fairly even play, when Llewellyn dropped a goal. The College replied promptly, Coote drawing the defence and passing to McKechnie for a try. Coote converted. The next try was a brilliant solo effort by Coote following a combined attack by the rest of the team. Then Pott scored for the Old Cranwellians. Coote again scored for the College and again placed the goal.

A few minutes later the Coote-McKechnie combination ran through from an opening by Bader, and Coote again converted. A stiff attack by the Old Cranwellians was held up by some fine tackling, but just before half-time White broke through on the wing at high speed and ran round to score near the centre. Llewellyn converted.

In the second half the visitors did more team work but the Cadets lasted better. Bader, who played a consistently good game at stand-off half, used his speed and an effective hand-off to score. Coote converted from an awkward angle. Windsor, a fast, light-weight, wing threequarter gained a lot of ground for Bader to score again, and once more Coote converted. Coote, who is the Captain of the team this year, added a penalty goal from a good length. The final score at the end was a try by White, converted by Llewellyn.

If the R.A.F. Selection Committee took the trouble to go to Cranwell for this match they must have learned several things which will be useful to them. Coote, who played for the R.A.F., will not be available this season, but two others in the Cadets' team are due to pass out of Cranwell at Christmas and one of them at any rate should solve one of the problems of the Representative team.—C. M. MCA.

Inter-Service Swimming.

The Inter-Services Swimming Championships were held in the Aldershot Command Bath on Oct. 14. The Championship was won by the Army, with 81 marks. The Navy were second with 77 marks and the R.A.F. third with 49 marks. The results in detail were:—

100 *Yards Free Style*.—Lt.-Cdr. A. A. Havers (R. Navy), 1; Spr. May (Army), 2; Tel. Goodman (R. Navy), 3. Time, 62 sec.

100 *Yards Back Stroke*.—Lt. E. G. Brown (Army), 1; A.B. Fryer (R. Navy), 2; B.Q.M.S. Rex (Army), 3. Time, 74 2-5 sec.

100 *Yards Breast Stroke*.—Pte. Rimmer (Army), 1; A.B. Mullins (R. Navy) and AA. Bradshaw (R.A.F.), dead-heat, 2. Time, 79 sec.

220 *Yards Free Style*.—Spr. May (Army), 1; Cadet Cockburn-Mercer (R. Navy), 2; Lt.-Cdr. A. A. Havers (R. Navy), 3. Time, 2 min. 16 4-5 sec.

440 *Yards Free Style*.—Marine Richards (R. Navy), 1; Tel. Goodman (R. Navy), 2; L.-Sgt. Mackenzie (Army), 3.

Diving (*Spring Board and* 12 *ft.*).—Cpl. Weale (R. Navy), 1; Driver Wooler (Army), 2; AC. Richards (R.A.F.), 3.

Plunging.—Col. W. Allason (Army), 79 ft. 6½ in., 1; Sub-Lt. A. C. Reed (R. Navy), 68 ft. 11 in., 2; Flt. Lt. G. Smylie (R.A.F.), 67 ft. 6½ in., 3.

400 *Yards Relay Race*.—Army (Capt. A. Mulligan, Lt. I. H. Mackillop, Lt. E. G. Brown, Bdr. Norris, Spr. May, Pte. Drane), 1; R.N. and R.M., 2; R.A.F., 3. Time, 3 min. 56 2-5 sec.

Water Polo.—R.N. and R.M. 3 v. R.A.F. 3; R.N. and R.M. 2 v. Army 2, Army 0 v. R.A.F. 0.

Championship Marks.—Army, 81; R.N. and R.M., 77; R.A.F., 49.

THE HEALTH OF THE ROYAL AIR FORCE.

Air Vice-Marshal David Munro, C.B., C.I.E., M.B., M.A., F.R.C.S. (E.), K.H.S., Director of Medical Services, R.A.F., in submitting his Report on the Health of the Royal Air Force for the year 1928, states that the health of the force at home and abroad has been good and compares favourably with that of previous years. The high level of physical fitness among officers called upon to fly and airman pilots, which has been noted in previous years, was well maintained during 1928. Eighty-eight per cent. were found fit for full flying duties on the occasion of their annual medical examination.

The most interesting part of the Report concerns the transfer of casualties by air. A short outline of the history of this type of ambulance work in the Service is given since the first R.A.F. aeroplane ambulance for duty in 'Iraq was sent to Egypt and became unserviceable in 1922 before reaching 'Iraq and without carrying any cases. The unhappy history continues:—

Two further ambulances marked with a red cross were erected at Abukir: one completed in the winter of 1922-23 was damaged on its journey to 'Iraq and was returned to Abukir for repair, the other arrived at Baghdad early in 1923 and within a few weeks met with an accident and was not flown again. Early in 1924 the repaired ambulance from Abukir reached Baghdad and was the last ambulance as such to be used in the R.A.F. In October, 1925, the red cross was deleted and the aeroplane came on the strength of troop carriers.

This does not mean that casualties are no longer carried by air. Since 1924 all troop carriers allocated to 'Iraq are modified so as to be convertible locally to carry two stretcher cases in addition to sitting cases when called upon. Other, smaller types of aircraft are also employed in evacuating lying and sitting cases when the nature of the ground prevents a troop-carrier from landing. A lying case is carried on a Neil Robertson stretcher secured along the top of the fuselage.

The Report states:—

The important part that the evacuation of patients by air plays in those commands where the nature of the country is such that any other means of transport is impossible or so laborious that the discomfort of the journey and the time taken would severely menace the patient's chances of recovery, becomes more evident each year.

In Palestine the evacuation of casualties by air has also developed into a routine procedure but there are no red cross air ambulances in that country either.

Another interesting section of the Report concerns the 1928 punitive operations in 'Iraq, described as having afforded an opportunity of testing the preparedness and ingenuity in improvisation of the medical organisation in that command. The operations were carried out by a base party and two mobile columns, in all some 300 men, and lasted from January to June under climatic conditions varying from the cold and rainy weather of winter to the tropical heat and frequent dust storms of Summer. Considering the difficulties the health of the force and the standard of sanitation was commendably high. At points where no desert water holes were available, water was carried by air to the columns from the base.

The coolest building was found to be one the walls of which consisted of earth-filled petrol tins two deep, covered by a roof of an inner layer of tarpaulin and an outer covered with muttee and the floor sunk four feet below the level of the ground. The experience gained in this expedition has resulted in several recommendations and the introduction of a revised scale of sanitary equipment for each unit.

A disquieting note in the section of the Report dealing with the Home Command is that forty-one cases of acute rheumatism were reported during 1928 among the aircraft-apprentices at Halton. Most of the cases followed an epidemic of tonsilitis and naso-pharyngitis.

The total number of deaths while flying on duty during the year was 65 as compared with 52 in 1927 and 78 in 1926. Flying accounts for 76 per cent. of the deaths due to injury on duty. Of the 23 deaths off duty, twenty were caused by motor accidents. Of the 2,364 cases of injury during the year, 946 were attributed to athletics and 498 to motor transport.

Only three cases were reported of injury during voluntary parachute descents compared with 12 cases, one of which was fatal, during 1927.

One officer was killed by rifle fire while flying.

In 1928, as in previous years, the flying Units, which

NEXT WEEK—THE AIR PARK ISSUE.

Digitized by Google

demand a high standard of fitness, show the lowest sickness incidence. The incidence of disease is twice as heavy in flying Units abroad, as in those stationed at home.

There has been a very considerable reduction in the share of the total sickness taken by sandfly, malaria, and influenza. The table of sickness at principal stations abroad shows that Hinaidi has the highest percentage of sandfly fever with Malta a close second. Karachi has the highest percentage of malaria with Abu Sueir (Egypt) the next highest. The case incidence per 1,000 strength for all diseases in the principal stations abroad is highest at Malta where it is 809.9. Hinaidi is 632.9, Cairo 529.3, and Karachi 507.5.

Although an epidemic of plague occurred in Aden in February, 1928, resulting in 1,107 deaths, no cases occurred in the R.A.F.

A daily ration of wheat germ is being issued to personnel in 'Iraq and Aden for a period of 20 months, the minimum time in which an opinion can be formed of its utility.

C. M. MCA.

TWO BOOKS TO BUY.

[The Vickers Virginia X Aeroplane (Two Lion Engines) Air Publication No. 1363. The Armstrong Whitworth Atlas Army Co-operation Aeroplane. Air Publication No. 1375. Both published by H.M. Stationery Office and obtainable from The Aeroplane Book Dept., Cannon House, Pilgrim Street, E.C.4., each for 3s.]

These official Air Ministry Publications are meant in the first instance for Service use and no doubt anybody in the Service who is interested in the habits and family history of the Virginia X or in getting Atlas-tic information has seen these handbooks long since. The purpose of this notice is not to bring coals to Newcastle but to bring these books to the notice of another section of the aeronautical community.

Anybody who wants to know all about the construction of these machines can now have the information they require. These handbooks contain amongst a mass of other detail, complete descriptions of the structures of the machines together with lay-outs of controls and bomb systems. There are any amount of good sketches and photographs, which make a study of the books well worth the while of anybody connected with aircraft design.

DATES TO BE NOTED.

November 5:—An interesting paper entitled *Steels for Automobiles and Aeroplanes* will be read by Dr. W. H. Hatfield, of the Brown-Firth Research Laboratories, before a joint meeting of the Institution of Automobile Engineers and the Iron and Steel Institute, to be held at the Royal Society of Arts, John Street, Adelphi, London, W.C.2, at 7.45 p.m. The present paper is a valuable addition to Dr. Hatfield's previous writings on the subject of special steels for automobile construction and is of the utmost interest to all automobile and aero designers. Dr. Hatfield will also read his paper at the Queen's Hotel, Birmingham, on Monday, Nov. 11, at 7 p.m.

November 21:—*The Inspection of Metals and their Alloys*, by Capt. L. W. Johnson, to be read at a Joint Meeting of the Institution of Automobile Engineers and the Royal Aeronautical Society at the Royal Society of Arts, John Street, Adelphi, W.C.2, at 7.45 p.m. This paper will also be read at the Merchant Venturers Technical College, Unity Street, Bristol, on Monday, Nov. 4, at 6.45 p.m.

November 25:—*The Mercedes-Benz Diesel Engine*, by Mr. W. H. Goddard, to be read before the Scottish Centre at the Royal Technical College, Glasgow, at 7.30 p.m., and before the Wolverhampton Centre at the Engineering and Scientific Club, Queen Street, Wolverhampton, on Tuesday, Nov. 19, at 7.30 p.m.

November 27:—*The High-Speed, Compression-Ignition, Heavy-Oil Engine*, by Mr. F. R. Banks, to be read at the Engineers' Club, Albert Square, Manchester, at 7 p.m.

Cards of invitation to admit visitors to any of the above meetings may be obtained on application to the Secretary, The Institution of Automobile Engineers, Watergate House, Adelphi, London, W.C.2.

THE ROYAL AERONAUTICAL SOCIETY.

An Informal Dinner (for men only) and Discussion will be held at the St. Ermin's Hotel, Caxton Street, Westminster, at 7.30 p.m., on Friday, Nov. 15, 1929.

After the dinner, Major J. S. Buchanan, O.B.E., A.M.I.Mech.E., F.R.Ae.S., will move:—

"That this meeting is of the opinion the present rules for the Schneider Trophy Race and the High-Speed Record are not consistent with the proper development of high-speed aircraft."

The Chair will be taken by Col. the Master of Sempill, A.F.C., A.F.R.Ae.S., President of the Society.

The price of tickets is 6s. 6d. each and members may bring guests. Early application is necessary. Informal morning dress will be worn.

Tickets may be obtained on application to J. Laurence Pritchard (Secretary), 7, Albemarle Street, W.1.

THE RECORD-BREAKERS' RETURN.

On Oct. 21 MM. Costes and Bellonte, who between Sept. 27-29 flew non-stop from Paris to Tsitsihar, Manchuria, a distance of 5,000 miles, in a Breguet XIX (600 h.p. Hispano-Suiza engine), arrived at Shanghai from Mukden.

They propose to return to Paris in three further stages, with stops at Hanoi and Karachi.

FOR THE FUTURE.

The Société Aéronautique Française (Avions Dewoitine) of Chatillon (Seine) is completing a machine, to the order of the French Government, which will be used for a further attempt on the World's Distance Record.

It will be a low-wing cantilever monoplane to be fitted with a 650/750 h.p. Hispano-Suiza engine. The wings are built round a single spar and are entirely of duralumin, including the covering.

The fuselage is a duralumin monocoque and will have accommodation for three. The undercarriage is of the cross-axle type.

The empty weight is estimated at 2,200 kgs. (4,840 lbs.) and provision is being made for 6,000 kgs. (13,200 lbs.) of fuel and oil to assure a range, in still air, of 10,000 kms. (6,210 miles) at a speed of about 200 km.p.h. (124 m.p.h.).

The dimensions of the machine will be: Span 28 m. (91 ft. 10 in.), Length 12.5 m. (41 ft.), and Wing area 75 sq. m. (808 sq. ft.).

The new machine is expected to be ready for test flights in March or April of next year and for the record attempt by about November. The pilot will be M. Doret.

J. B. RICHARD.

From a *Handley Page* Bulletin recently published one learns with great regret of the death of Monsieur J. B. Richards, of Brussels, who died suddenly on Sunday, September 8. For some strange reason the death of M. Richard did not become known in this country at the time, although M. Richard was known to almost everybody in the Aircraft Industry and in the past ten or eleven years has done valuable service for British Aviation.

One first met M. Richard when he began to deal in the products of the Aircraft Disposal Co. Ltd. on the Continent of Europe. M. Richard either knew then, or very soon came to know, practically everybody of note in connection with aviation in Europe.

During those early years after the War France and Italy flooded all the newly formed self-determined nations with obsolete war-time aircraft and almost gave them away, presumably with the idea of establishing their national aircraft in those countries. M. Richard, with his extraordinary commercial ability and his strong personality, managed to sell at quite reasonable prices aeroplanes which had been reconditioned and practically rebuilt by the Aircraft Disposal Co. The result was that, although our war-time machines like those of France and Italy were built very largely of material which would never have been passed as fit for use in time of peace, they built up for British aircraft a reputation for first-class workmanship and design which laid the foundation for the present high reputation of our aeroplanes and engines of modern design and construction.

There were those at that time who held that M. Richard and the Aircraft Disposal Co. were doing harm to the British Aircraft Industry because by selling reconditioned machines cheap they were preventing us from selling new machines at high prices. This was a foolish argument worthy of the British shop-keeper. While French and Italian machines were being practically given away there was obviously no hope to getting our price for new machines from little new-born nations which had practically no money, or were paying for their war material with money lent to them by France on the condition that the money was spent with French manufacturers of armament.—Though this money was in fact owed by France to us.

The truth is that M. Richard by his tact and skill and ability laid the foundation throughout Europe for the introduction of modern British aircraft as soon as the smaller nations made the money to pay our prices.

Some few years ago M. Richard parted company from A.D.C. Aircraft Ltd. and more recently has been representing Handley Page interests on the Continent.

M. Richard was a man of strong personality and of remarkable charm. He was a big man with what at first seemed to be a fierce expression, but when one got to know him one found that he was one of the kindest-hearted of men. He was hospitality personified, and however busy he might be he could always find time to do a good turn for a friend, or even for a chance acquaintance.

By the death of M. Richard, England has lost a very valuable friend on the Continent and many people in all nations will grieve personally that he is no longer with us. To Madame Richard and his family one offers the deepest sympathy.—C. G. G.

NEXT WEEK—THE AIR PARK ISSUE.

Digitized by Google

THE LIGHT AEROPLANE AND THE FLYING CLUBS.

THE RELIABILITY OF THE D.H. GIPSY ENGINE.

The D.H. Tiger Moth made its first appearance in the Race for the King's Cup in 1927 and startled everyone by its amazing performance and almost incredible top speed. The Tiger Moth was twice as fast as anything else with the same power.

Later in the same year, on Aug. 24, to be precise, Mr. Hubert Broad flying a D.H. Tiger Moth with a Gipsy engine, which at that time was still pagan and unchristened, put up a World's Record for speed over 100 km. in the Light Aeroplane category for machines between 200 and 350 kgs. The speed was 300.1 km./hr. (186.3 m.p.h.), and as the course was across country in a bad light, and included a sharp turn, the actual top speed must have been 200 m.p.h. For this achievement the engine was giving 135 h.p.

After this successful attack on the Record the engine was detuned to its present h.p. by lowering the compression-ratio and using smaller valves. One immediate result of this was that ordinary commercial No. 1 petrol could be used in the engine. An even more important result was complete reliability.

Here was an engine, which had given a most convincing demonstration of its capabilities, detuned to a lower horse-power and at the same time retaining all those features, if the lessened compression-ratio and the decreased valve-heads be excepted, which had made its record performance possible. Such a policy was a complete reversal of the usual business of tuning up a production engine for some special object.

At the end of 1928 a standard Gipsy engine was selected at random from the flow of production engines and fitted to a standard D.H. Moth, G-EBTD. This engine was then sealed throughout by the Aeronautical Inspection Department.

The carburettor was sealed to the induction-pipe, which was then sealed to the cylinder-heads. The valve-rockers and cylinder-heads were next sealed to the cylinders, which were in turn sealed together. The magnetos and oil-pumps were sealed to the crank-case, the halves of which were also sealed together. Thus no replacements could be effected without breaking the seals.

On Dec. 29, 1928, began the attempt to compile a total of 600 hours in the air without overhaul, repairs or replacements. As far as possible the Moth was to be flown at a cruising speed of 85 m.p.h.

For nine months G-EBTD has flown without any overhauls, repairs or replacements to the engine. The only attentions that the power-plant received were the cleaning of sparking-plugs and filters, checking of the contact-breakers and valve-clearances and the correction of a minor defect in the impulse-starter mechanism of one magneto.

The 600 hours' flying-time were finished on Sept. 24 of this year, by which date G-EBTD had flown 51,000 miles, a distance of more than double the circuit of the Earth round the Equator. An even more interesting comparison is that such a distance represents about five years' mileage of a normally-run car. Who would run a car for five years, without overhaul, replacement or decarbonising?

The total running-time including bench-tests, taxying and running up before each take-off was 661 hours 5 min.

The petrol consumption (Pratts No. 1) for the 661 hours was 4½ gallons per hour, or 19 1-7 miles per gallon. The oil consumption (Wakefield's Castrol XXL) was .45 pint per hour, or 1,400 miles per gallon.

Three bench-tests were made on the Heenan and Froude Hydraulic Brake, one when the engine was new, the second after 500 hours' flying when the engine was removed for display at Olympia, and a final test after the completon of the 600 hours.

The power-curves of the Gipsy engine. No. 1, the original acceptance curve. No. 2, after 500 hrs. No. 3, after the conclusion of the trial.

The curves show how extremely slight the actual decrease in power after this long trial was, a matter of 2.4 b.h.p. at 2,050 r.p.m.

The cost, based on the spares retail price list, of the replacements necessary to make the engine airworthy again was £7 2s. 11d. This was made up as follows:—

	£	s.	d.
8 Piston-rings and scraper-rings (worn)		14	0
1 Piston (Broken piston-ring "land")	1	12	6
8 Valve-guides (worn)	1	19	4
8 Valve-rocker bushes (worn)		14	8
8 Valve-rocker adjusting screws (worn)		18	0
2 Valve push-rod tubes (worn by rubbing on cowling)		5	0
1 Oil-pipe nut (fractured)			4
1 Carburetter float (distorted)		4	0
2 Carburetter balance-weights (worn)		2	0
2 Carburetter throttle-spindle bushes (worn) ..		2	0
1 Magneto carbon brush (worn)			9
1 High-tension lead		3	2
4 Cylinder-head gaskets (always replaced on overhauls)		3	8
Induction pipe repaired		3	6
	£7	2	11

These figures and the remarks which follow show that the aero-engine, although it runs constantly, at or near full power is far more durable than is any car-engine. No car on Earth could do 50,000 miles without overhaul. This is largely because aero-engines run in pure air and do not suck in road dust to wear away their parts. On the other hand the Gipsy is a big-bore slow-running engine compared with those of high-speed cars, and so its bearing-surfaces are less highly stressed. Which is interesting in view of the

THE LATEST D.H. SEAPLANE.—The D.H. Hawk-Moth fitted with Short metal floats taxying on the Medway at Rochester.—(*"Aeroplane" photograph.*)

tendency of British motor-manufacturers to follow American practice in this matter, as shown at Olympia.

Major F. B. Halford, who is co-designer with Capt. G. de Havilland of the Gipsy engines makes the following comments on these replacements and the probable causes thereof.

Piston and Scraper Rings.—The wear experienced appears to be about normal and it is difficult to see how to lengthen the life of these rings appreciably, bearing in mind that they must remain capable of keeping the oil consumption down to half a pint per hour, a consumption lower per horse-power than that of any other known aero-engine.

Piston.—The exact cause of the broken "land" is not known. It appears to be an isolated case, based on the experience of other Gipsies."

Valve-guides, Rocker-bushes, Adjusting-screws.—The wear on these parts is probably normal under the circumstances, but the life of them does not compare favourably with the rest of the engine. Modifications were already in hand, before the completion of this test, which now treble the life of these parts.

The remaining items call for no particular comment, although none, however small, will be neglected.

Carbon deposit.—Considering the number of hours run, the absence of carbon deposit both inside the cylinder heads and in the crowns of the pistons is most satisfactory. In no place does it exceed .012 in. (twelve thousandths of an inch). Bearing this in mind in conjunction with the valve-gear modifications already referred to, it is no exaggeration to say that the "500 hours between top overhaul" period for all "Gipsies" is very near at hand.

Although, in order to secure inter-changeability of parts the drawing limits are necessarily close, it is interesting to note that the dimensions of the following details when measured up after the test, on their wearing surfaces, were found to be still within the tolerances permitted: —

(*Crankcase*)—Main bearing bores; (*Crankshaft*)—Crankpin diameters; (*Camshafts*)—Cam profiles and bearing; (*Connecting-rods*)—Big-end bores, Small-end bores, Alignment; (*Gudgeon-pins*)—Diameter; (*Cylinders*)—Bores, ovality and parallelism; (*Valve-springs*)—Loads; (*Rocker-bracket Spindles*)—Diameters; (*Valve-rockers*)—Bores; (*Tappets*)—Diameters; (*Timing-gears*)—Wear and backlash; (*Oil-pump*)—Clearances in gears and bushes.

Judging by the experience gained from this test, particularly in relation to "wear," there appears to be no reason why the period between complete overhauls should not be increased to 1,000 hours in the near future. With a machine cruising at 100 m.p.h. (which is already in sight) this would be equivalent to a complete overhaul every 100,000 miles.

ANGLO-FRENCH RECORDS.

The Aeroplane of Sept. 18, 1929, reported that, subject to homologation the Mauboussin single-seat monoplane flown by M. Fauvel had beaten three World's Records for aircraft weighing less than 200 kgs. (440 lbs.). These records were for height, for speed over 100 kms., and for distance over a closed circuit.

Since then M. Fauvel in the same machine has, subject to homologation, flown the record distance non-stop in a straight line for machines in the above class. He flew from St. Inglevert to Pau, a distance of 850 km. (528 miles) in 7 hrs. 20 min., at an average speed of about 72 m.p.h.

The Mauboussin monoplane, which was described in The

51,000 Miles Test under Seal!

600 hours Flying at average of 85 m.p.h.

On October 15th the sealed De Havilland Gipsy Moth engine, having completed a test flight of 600 HOURS covering 51,000 MILES at an average speed of 85 m.p.h. without deca bonisation, was dismantled under the supervision of the Air Ministry Aeronautical Inspection Directorate

The machine was found to be in need of only £7 replacements to maintain the Air Ministry Certificate of Airworthiness.

This performance by a British machine, is unapproached by any aero engine in the world, of whatever size, and was carried out on Pratts High Test petrol, the petrol consumption being 19½ miles per gallon. At the end of the test the engine was still running perfectly.

AN EMPIRE MARKETING DISPLAY.—Avro and Armstrong Siddeley products shown by the Ottawa Car Manufacturing Co. Ltd., which holds the manufacturing and sales rights for these products in Canada.

Aeroplane of Feb. 13, 1929, is fitted with an A.B.C. Scorpion engine, which for all these successful attempts was equipped with K.L.G. sparking plugs. One may truthfully say that an *Entente Cordiale* had a lot to do with this success.

THE KARACHI AERO CLUB.

The Karachi Aero Club, which began flying last February, flew 1,094 hrs. 45 mins. between February and September. The Club started with two Moths, but since one of them was written off as the result of a forced landing on July 12 the work has fallen on the remaining one. The Club consider that the hours flown by these two machines, one of them 255 hours 25 minutes, and the other 839 hours 20 minutes, a very fine tribute to De Havilland workmanship.

During the month of September 183 hrs. 25 mins. were flown on one machine, a record for the Club and an achievement which reflects great credit on the Club's Pilot Instructor, Flt. Lt. William Jones, R.A.F.O., and the Club's Ground Engineer, Mr. D. M. Langford, whose untiring efforts have kept the machine in commission.

During September seven members got their pilots' "A" certificates *ab initio*, and one ex-R.A.F. officer requalified.

The total membership of the Club is 159, including 71 flying members,—of whom 36 are Europeans and 35 Indians. From February to September 20 members qualified for "A" certificates and two members requalified.

The Club has been using the Government hangar on the Civil Aerodrome at Drigh Road up till now, but hopes to move into its own new hangar at the end of this month.

AN AIRBORNE LECTURER.

Lady Bailey, as reported in The Aeroplane of Oct. 16, left Croydon on Oct. 12 on the start of a trip to Oslo but was forced by inclement weather to land at Gothenburg and proceed to Oslo by train. On Oct. 14 in Oslo she gave a lecture before a large audience on her African flight.

THE D.H. GAZETTE.

The attention of all subscribers to the *D.H. Gazette* is called to the necessity of notifying the Editor of their changes of address. At the present time the Editor is inundated with copies returned by the Post Office.

Another point in connection with the *D.H. Gazette* is that subscribers who write complaining that they have not received "last month's-issue" should refer to the wording of their subscription forms, which state that the subscription entitles them to 12 numbers as and when they appear. The trouble is that the Editorship of the *D.H. Gazette* is a part-time job and, occasionally, pressure of other duties prevents the regular appearance of the paper.

A GOOD PULL-UP FOR AVIATORS.

A new landing-ground for light aeroplanes is in course of preparation and will be ready next Spring at Wansford. The field is immediately opposite a Garage and Filling Station and is the property of "The Haycock," an excellent old coaching inn, which provides hunting and shooting in the winter and tennis and boating in the summer.

Wansford is conveniently near the Norwich, Northampton, Leicester and Nottingham Aero Clubs and is only 50 minutes from Heston Air Park.

The Automobile Association, who assisted in the negotiations with the owner of the land, state that owner-pilots and flying club members can no longer say that they have nowhere to go.

AN ACCIDENT TO MR. H. A. BROWN.

On Oct. 19 Mr. H. A. Brown, the chief test pilot of A. V. Roe and Co. was badly injured when the Avro machine he was flying crashed at Woodford Aerodrome. Nobody saw the accident but Mr. Brown is stated to have said that the engine suddenly failed.

AT THE SIGN OF THE HAYCOCK.—Some private owners and flying club members at The Haycock, Wansford, where seven machines landed for lunch on the day after the Leicester Club meeting. Left to right (front row): Messrs. Linnell, Tyzark, Linnell, Grey, Tapper, Whittome; (back row): Messrs. de Havilland, Malcolm, Tyler, Ballantyne, Olney, Buckingham, and McDougal.

COMMERCIAL AERONAUTICS.

TEN YEARS OF AIR TRANSPORT.

On October 7, 1919, in the same year in which the International Air Traffic Association (I.A.T.A.) was founded in The Hague, the K.L.M. (Koninklijke Luchtvaart Maatschappij voor Nederland en Koloniën (The Royal Air-Traffic Company for the Netherlands and Colonies) was founded by a group of prominent bankers, trading companies, and shipping concerns.

As they were convinced of the great future of air traffic and of the necessity that Holland should enjoy as soon as possible this new means of transport in Europe, they agreed that Holland should participate in it with its own airlines. In particular then they had also in view the future establishment of air lines in the Netherlands East Indies and of air services between the European and Asiatic Netherlands.

Of course, they were aware that years and years must pass before air traffic in Europe and in the Colonies would become self-supporting.

Relations with the Netherlands Government were very friendly from the beginning, though somewhat uncertain, as nobody could actually have any clear idea of the running expenses and the extent of Government support.

The Netherlands authorities at once took up the organisation of the aerodromes, wireless service, meteorological information, etc., and declared their readiness to cover two-thirds of the losses of the company, up to a certain limit. Thus from the beginning the private character of the company was well maintained, as the shareholders would have to cover at least one-third of the losses, and even more. This principle was maintained from 1920 till 1922.

The company was originally founded with a capital of 1,015,000 florins (more commonly called guelder). This amount was raised to Fl.1,513,000 in the year 1925.

In 1923 the Government granted a subsidy for four years, ending on December 31, 1926. The principle of this contract was: granting a diminishing subsidy (Fl.400,000 for each of the years 1923 and 1924 and Fl.300,000 for each of the remaining years, 1925 and 1926) for running a limited number of lines. After this period a new contract was made over seven years, expiring on December 31, 1933.

The basis of the latter contract was that the Government granted a fixed yearly subsidy on a diminishing scale, whereas the Company engaged itself to produce a steadily increasing quantity of ton-kilometres on its international routes.

Thus again the purely private character of the company was clearly indicated.

In 1927 the old shares were written off to 40 per cent., and a new capital was raised, bringing the total amount to Fl.1,253,200. The Government itself took shares to the amount of Fl.500,000—included in the above-mentioned.

K.L.M. Airlines.

Actual flying services were started on May 18, 1920. The first line operated was a service from Amsterdam to London and back. This is the oldest of the K.L.M. lines. It was stopped during the Winters 1920-1921 and 1921-1922, but has been running ever since.

Successively the operations were extended to Bremen, Hamburg, Kopenhagen, Brussels, Paris, and Malmö.

In 1928 the K.L.M. was running its own lines to London, Brussels and Paris. The line to Hamburg was flown in collaboration with the Deutsche Luft Hansa, to Kopenhagen—Malmö in co-operation with the A.B.A., and to Basle—Zürich in collaboration with the Balair.

Transit routes Malmö—London and Malmö—Paris, by way of Amsterdam in both directions, were established.

Airports.

Originally in Holland only one aerodrome was available. This was the military aerodrome of Schiphol, near Amsterdam.

THE CHIEF.—Mr. A. Plesman, founder, organiser, and chief director of the Koninklijke Luchtvaart Maatschappij (K.L.M.), to whom primarily is due the prominence of Holland in the air traffic of the World.

In 1921 the Community of Rotterdam created an aerodrome, and thus was the first town in the World to possess its own municipal aerodrome, setting an example which afterwards has been followed by numerous other cities and countries.

In 1927 the Community of Amsterdam took over part of the aerodrome of Schiphol, which afterwards was highly improved.

The K.L.M. has tried from the very beginning to attract the public to the aerodromes, in order to popularise flying and get the visitors over certain prejudices.

K.L.M. has therefore run her own restaurants and hotels on both aerodromes, and has organised joy-riding, and has invited the visitors to come and see the hangars. Also many joy-rides were organised in the country. These measures have contributed enormously to make the public of the Netherlands more air-minded.

Traffic.

The following figures demonstrate the development of K.L.M. traffic:

FIGURES FOR TEN YEARS OF AIR TRANSPORT.

1920	1921	1922	1923	1924	1925	1926	1927	1928
Kilometres flown:—								
82,000	350,000	397,000	540,000	790,000	965,000	895,000	1,310,000	1,623,060
Passengers carried:—								
345	1,664	1,414	3,937	3,648	5,729	6,275	12,916	17,007
Goods carried (Kgs.):—								
22,000	44 000	90,500	166,500	147,000	225,000	255,000	402,000	674,000
Letter mail carried (Kgs.):—								
2,900	1,500	1,000	1,700	1,650	2,100	2.400	19,900	34,862

NEXT WEEK—THE AIR PARK ISSUE.

Digitized by Google

The K.L.M. has always made very strong efforts to develop goods traffic as much as possible. It was the first company in the World to establish its own booking offices, first at Amsterdam, in 1921, and afterwards at Rotterdam, in 1924.

With these booking offices as a centre, strenuous canvassing has been done, with remarkable results. The shipment of flowers and other horticultural and agricultural products, especially, has developed enormously. Contracts were made with the most prominent firms.

Special Flights.

The K.L.M. has made a special point of organising big tourist flights for various purposes.

In the year 1927, about 80,000 kilometres were covered on special flights, and in 1928, 99,520 kms.

In particular, mention may be made of special flights to bring food and mail to the islands off the coasts of the Netherlands when in Winter they were entirely isolated owing to ice-drift.

Aircraft.

In 1920, when commercial aircraft were not built anywhere, to buy a fleet of old warplanes changed for this purpose would have been highly uneconomical, the K.L.M. entered into a charter-agreement with the British firms Aircraft Transport and Travel, Limited, and Handley Page Transport, Ltd.

At the end of 1920, however, the Fokker Works at Amsterdam produced the first commercial aircraft, the so-called type FII, a monoplane with cabin for four passengers and a Siddeley Puma water-cooled engine of 240 h.p. The K.L.M. bought two of these machines. It may be noticed that these same machines are still to-day in actual service with the S.A.B.E.N.A. [Here one may add that actually the first commercial aeroplane designed as such was the Koolhoven F.K.27, built by the British Air Transport (Bat) Co. in 1919.—C. G. G.]

In 1921, a new type was developed, the Fokker FIII (Siddeley Puma), of which a fleet of ten machines was bought.

In 1924, the first of the FVII type (Rolls-Royce Eagle IX. engine) was put into service, and soon was followed by the well-known Fokker F VIIa, with a Bristol Jupiter engine of 450 h.p. The K.L.M. were thus the first air traffic company to use air-cooled engines for commercial purposes.

In 1927 and 1928 the FVIII machine, with two Bristol Jupiter engines, were entered into service, and in the latter year also the FVIIb, with three Titan engines.

At the end of the year 1928 the fleet of K.L.M. consisted of the following machines:—

1 plane for photographical purposes PH-ABX,
1 FIII (Jupiter) PH-ABV,
2 FVII (Jupiter) PH-ACR and PH-ACJ,
8 FVIIa (Jupiter) PH-ACT, PH-ADN, PH-ADO, PH-ADR, PH-ADX, PH-ADZ, PH-AEB, PH-AET,
5 FVIII (twin Jupiter engines) PH-AED, PH-AEF, PH-AEG, PH-AEH, PH-AEI,
4 FVIIb (three Titan engines) PH-AEO, PH-AEP, PH-AEZ.

The policy of K.L.M. has always been to keep the fleet as small as possible and to get the greatest number of flying hours out of the machines. Of course, this depends largely on the type of machine and its ease of maintenance.

In the year 1921, of every hundred days a machine was only 53 days out of a hundred available for service, and had to be kept 47 days in the hangar for maintenance. In 1928, each machine was available 88.1 days out of 100.

K.L.M. have made a custom of selling all aircraft not strictly wanted in its organisation, so as to keep the fleet up to date. The two FIIs sold to S.A.B.E.N.A. have already been mentioned. The Balair bought five FIIIs, the Czecho-Slovakian Company two FVIIas. Also, many private persons have bought K.L.M. aircraft for special purposes.

In the beginning the machines flew only 300 hours a year, but lately 1,000 flying hours per machine have been obtained. This was possible owing to a very strict system of control of machines and engines, and by very severe organisation in the workshops.

The commercial results developed accordingly. In 1922, the ton-kilometre cost Fl.4.74. This was already reduced to Fl.1.21 in 1927. This amount includes all expenses, and is obtained by dividing the total running costs of the company per year by the total ton-kilometres produced. Here is the scale 1922 1927:—

Year.	Ton-Kms.	Price per Ton-Km.
1922	163,000	Fl. 4.74
1923	239,000	Fl. 3.00
1924	359,000	Fl. 2.23
1925	610,000	Fl. 1.80
1926	883,000	Fl. 1.41
1927	1,272,000	Fl. 1.21

Technical Service.

The workshops of K.L.M. on the aerodromes of Waalhaven were in the beginning very small and confined to repairs of engines and smaller parts of the machines. Big repairs were done by the Fokker Works.

The K.L.M. workshops have developed steadily and have taken over all repairs. Even new machines have been built, and very important improvements on machines and engines, which have later been adopted by the constructors, have been made by the Technical Service of K.L.M.

In this connection, the fact may be mentioned that the K.L.M. has done much pioneer work by bringing into Civil Aviation for the first time new types of aircraft, and especially new types of engines. As was pointed out already, the K.L.M. was the first air traffic company to use air-cooled engines, and recently it was the first to use the new Bristol Titan engine.

Pilots.

In 1921, the K.L.M. began running its air services with British and German pilots, and only two Netherlands pilots left the Army to enter Civil Aviation. In 1922, however, the greater number of the pilots was already of Netherlands nationality. And in 1923, only one foreign pilot was in service with K.L.M.

As there is no commercial flying school in Holland, the K.L.M. has to take her pilots from Army and Navy service and give them additional instruction.

The last year's candidates from the Flying Services were detached during the Winter months to K.L.M., and have been following there special courses in meteorology, wireless telephony, navigation, instruments, etc. A separate course was given in so-called "blind flying" in machines with dual control.

Wireless Service.

K.L.M. machines are all fitted with wireless telephones, which, on the whole, has given satisfactory results. The Marconi type A.D.6h has been used lately.

Foreign Organisation.

The K.L.M. has had from the very beginning its own ground organisation on Croydon aerodrome, and has recently founded such an organisation on the aerodrome of Le Bourget (Paris).

In other ports it has left the care of the ground organisation to the local air traffic company, but in the principal ports it has appointed its own representative, who has often been assisted by a special "commercial attaché," so that not only technical service, but also the commercial interests of the business, should be run acording to the K.L.M. system. This has given excellent results, and has helped to develop the traffic considerably.

Co-operation with Foreign Companies.

Co-operation with foreign companies has always been excellent. On many lines this co-operation has taken the form of pooling services, as, for instance, with the A.B.A. on the Amsterdam-Malmö route, with the Deutsche Luft Hansa on the line Amsterdam-Hamburg, and with the Balair for the service Amsterdam—Basle—Zürich.

Aerial Photography.

The K.L.M. established in 1921 a department for aerial photography, which has been from the very beginning a big success. Aerial photography is used for illustrations in many prominent papers and periodicals, and series of postcards, with air views of picturesque towns in Holland, are sold in all bookstalls, stationery shops, etc. Specially big industries, communities, public works, etc., have used K.L.M. aerial photography for various purposes.

In 1926 the K.L.M. published the book Nederlands Grootste Bedrijven Vanuit de Lucht, giving descriptions of the most prominent factories, concerns, towns, etc., with splendid aerial photographs. This publication awoke the highest interest among the various industries, etc., of Holland.

In 1928 an English edition of the same character was published called "The Importance of Holland Seen frem the Air."

The Amsterdam-Batavia Service.

In 1924 the first trial flight from Amsterdam to Batavia was made with an FVII (Rolls-Royce) machine.

In 1927, two return flights were made, one with the purpose of bringing a tourist to the Netherlands East Indies and back, and one to establish a quick postal connection between the two parts of the Dutch Kingdom.

In 1928, four machines were sent by air to their destination, the Netherlands East Indies, and two other trial flights for postal purposes were made.

It is the intention of K.L.M. to continue these flights and study the possibilities of a weekly postal service in both directions, with a flying time of about 12 days (by steamer at least 23 days), so that a regular service may be established in 1931.

NEXT WEEK—THE AIR PARK ISSUE.

Digitized by Google

Services in the Netherlands East-Indies.

In 1927, a part of the shareholders of the K.L.M., together with other firms, specially interested in Dutch Colonial work, founded the N.V. Koninklijke Nederlandsch-Indische Luchtvaart Maatschappij (K.N.I.L.M. Royal Netherlands Indian Air-Traffic Company), which is working in close collaboration with the K.L.M.

The first services opened, on the first of November, 1927, on the routes Batavia-Bandoeng and Batavia-Semarang. Other services, such as to Soerabaia, Singapore, and Palembang-Medan will follow soon

From the very beginning traffic on these routes has been intense.

The Indian services will in future link up with the Amsterdam-Batavia route and with the British lines to Australia and New Zealand.

Conclusion.

From the first the K.L.M. has made a very strong stand against foreign companies which were enjoying greater subsidies and other facilities. As an average competing concerns were receiving a subsidy many times greater than K.L.M. per kilometre flown.

This often has been the reason why K.L.M. could not develop as fast as desired. But, on the other hand, it has compelled K.L.M. to keep its organisation on strict business lines and to try to make air traffic as soon as possible a self-supporting enterprise.

Although there have been many crises in the existence of K.L.M., it is to-day the oldest air traffic concern. And on October 7, 1929, it had worked without interlude for ten consecutive years under the same name and the same management.

A Personal Note.

[In these ten years air traffic and air services have developed steadily and satisfactorily. For these results the highest credit is due to Mr. A. Plesman, who first conceived the idea of the K.L.M., did all the first organising, and has remained the manager and guiding spirit of the firm ever since. His determination has carried the business through many difficulties, and his strong personality has made Holland, although a small country, one of the greatest influences in the World-development of Civil Air Traffic.

In his work he has been ably seconded by Mr. Hans Martin, the Secretary and General Business Manager of the firm, whose tact and organising ability have done so much to back up the initiative and driving power of his chief.

No account of the K.L.M.'s work would be complete without recognising the value of the work done by the various Aerodrome Managers of the firm. Mr. Thomson, at the Schiphol Aerodrome at Amsterdam, besides managing the firm's business on the aerodrome, is also Chief of Flying, and has the allocation of the different journeys to the different pilots and machines, and so forth. Mr. Bouman, at Rotterdam, has to deal with a vast amount of traffic, and with the synchronising of the various services at that important junction.

At Le Bourget, the firm have Mr. Mohr, whose tact in adjusting temperamental differences between his Nordic and Latin co-operators has been of great value. And at Croydon, since the K.L.M. business began there, the firm have had Capt. H. Spry Leverton (late, the Duke of Cornwall's Light Infantry), whose personality and humour, combined with sound business ability, have helped to make the K.L.M. one of the most popular institutions at our Terminal Aerodrome.

A great deal of the success of the K.L.M. is certainly due to Mr. Guillonard, the firm's Chief Engineer. His particular task is to study the technical developments of the commercial aircraft of all nations and learn what he can from them, while on the other hand he learns the very valuable technical lessons which are taught by the bitter experience of regular air-line operation. Combining both kinds of experience, he has been able to make improvements in the firm's aircraft which have been of the highest value not only to the K.L.M. but to the Fokker Co., which firm has built practically all the aircraft which are used by the K.L.M.

Also, the Civil Aeronautical Community must recognise the good work that has been done by Mr. Stephan, the manager of the Fokker Company, in co-operating so closely with the K.L.M. and arranging to modify Fokker aircraft to suit the needs indicated by the experiences of the K.L.M.

This experience gained in K.L.M. work has helped materially to make Fokker aircraft the most widely-used commercial machines in the World, in the United States and Canada as well as in Europe and Asia. And the fact that the Duchess of Bedford, Mr. Holt (the financier), Lt. Glen Kidston, Mr. Van Lear Black, Lord Carbery, and other private owners, have had to buy Fokkers because nothing else would do the jobs they wanted done, is largely due to the fact that the work of the K.L.M. produced machines which fitted those jobs.

In every way Mr. Plesman and his able helpers in the development of the K.L.M. may feel that in the work of the past ten years they have not only made themselves World-famous, but that they have done service to the World by advancing the cause of Air Traffic very considerably.—C. G. G.]

TRANSPORT.

Speaking at the Twenty-fifth anniversary banquet of the Commercial Motor Users' Association on Oct. 15, at which H.R.H. the Prince of Wales was the Guest of Honour, Lord Thomson, Secretary of State for Air, said that shortly after Parliament opened he hoped to invite 100 members of all parties to take a flight in R.101 and he hoped there would not be 100 bye-elections. He hoped to see the day when great railway centres in London and the big cities were equipped with overhead aerodromes.

Among those present at the banquet were Mr. Montague (Under-Secretary for Air), Col. the Master of Sempill (President of the R.Ae.S.), Sq. Ldr. Orlebar, and Flg. Off. Waghorn.

AN ENGLISH COMMERCIAL AIRCRAFT.—The Avro 5 (three Genet-Majors), for pilot and four passengers, built by A. V. Roe and Co. Ltd. on Fokker lines.

THE AIR-DOGS' DINNER.

Squadron Leader E. L. Johnston and Captain A. G. Lamplugh and Mr. Laurence Wingfield must have felt very proud of themselves on Saturday night at the Inaugural Dinner of the Guild of Air Pilots and Navigators of the British Empire. That is the proper title of the Guild, which aspires to be, and undoubtedly will be in time, as important as is the Guild of Master Mariners. It may never be as rich as some of the ancient City guilds, but, seeing the influence and the power it will have over the development of Imperial air transport it may very soon become more important. In spite of all this, the Guild will justly be known all its days as the Ancient Order of Air-Dogs, for it does include within itself the finest collection of thoroughly able, seasoned, weather-beaten and tried-out air pilots of any organisation in the World—and a real good crowd they are.

Presumably by way of giving the proper atmosphere, the Hotel Cecil put the Guild into the coldest dining-room in which one has ever eaten. Personally one sat in a draught which made one feel that one was in the open cockpit of some trans-Polar air-liner on the Grand Circle course to Japan. However, that atmosphere was counter-balanced after dinner, when the party transferred itself to the Palm Court, where the temperature was about that in which Imperial Airways' pilots will probably bask when the line gets to Singapore or thereabouts. We certainly had Greenland's icy mountains and India's coral strand to give us the illusion of World Travel.

A pleasing incident at the start of the dinner was the saying of Grace by the Reverend P. Donald Robins, who was known and respected in the earliest days of Civil Aviation as one of the most reliable pilots of Air Transport and Travel, Ltd.

After dinner, Mr. Montague (Under-Secretary of State for Air), proposing "Success to the Guild," emphasised the importance of air navigation and the necessity of a Guild which should make air pilots and navigators equal in status to members of the other great professions. He remarked how struck he was by the great number of interests covered by the Memorandum of Association, and pointed out its wisdom—for consideration should come before discussion.

Referring to the benefits of a Guild as such, he told a rather nice story of a nigger teamster who had been skilfully flicking flies off his mules with the lash of his whip. Further along the road the vehicle passed a hornet's nest, and a passenger suggested that he should upset the hornet's nest with his whip. To which the driver replied: "I guess not. Dem hornets is organised."

Mr. Montague said that a few months ago he knew nothing about aviation, but had now become a convert, and had profound belief in the commercial possibilities of air transport. [He has flown over 3,000 miles in the past six weeks.—C. G. G.]

Air Vice-Marshal Sir Sefton Brancker, K.C.B., A.F.C. (the Worshipful Master of the Guild), said that this was the first time in his life that he had been called Worshipful, and added that if he was going down to History at all he would rather go down as the Master of this Guild than as anything else. He reminded us that aviation was only ten years old, and that it had done extraordinarily well. We had set up a wonderful standard of efficiency and safety.

He pointed out that the Prince of Wales and Prince George were doing a lot of flying, and were likely to become pilots, and their lead would do an immense amount of good.

This meeting, he said, was the first since air pilotage had become a legally recognised profession. Their nearest relatives were the Guild of Master Mariners. He remarked that the old Guilds were wealthy and were able to be charitable. None of us were likely to see this Guild rich, but he hoped that it would follow in the steps of the others. The Guild was itself Imperial, and would be quite a big factor in keeping the Empire together. He reminded us that every member must do his best work.

He said that the Press were doing their best, but we wanted more propaganda for aviation. Our revered Prime Minister was the finest example in the World of an Apostle of Peace. The International Commission of Air Navigation now included twenty nations, and the representative of each was himself a good patriot, but they were always a happy party. This was a great factor in holding the nations together. He remarked on the spirit of good fellowship which one found among pilots of all nations. The pilots of other nations were just as keen as ours, and showed just as fine a spirit.

Mr. Lawrence Wingfield, M.C., D.F.C., the Clerk to the Guild, proposing "The Guests," said that the Guild would be a free and independent and critical body. Already it embraced men from the ends of the Empire, and the Guild hoped to meet them and hear of their experiences at future dinners. He said that the Guild could not afford to put a £5 note under the plate of each guest, as one City Guild was said to do, but at least they had been able to give each lady guest a spray of flowers, to express their sentiments.

Lieut.-Colonel I. A. E. Edwards, C.M.G., Managing Director of National Flying Services, Ltd., said that this dinner was an epoch-making event. The position of pilots was daily becoming more analagous to that of the Master of a ship. There was a time when pilots were regarded as super-men, but actually they were not. He told the story of the test pilot who, having come down to a strange aerodrome to test a new machine, sat in it and waited for the engine to start while the mechanics swung the airscrew. Presently another pilot strolled up, and remarked: "What about turning on a spot of petrol?" Which only showed that even test-pilots were not super-men.

But in these days, Col. Edwards said, pilots had to be very highly qualified, and so they might in time become super-men with bulging eyes and ears.

THE INAUGURAL DINNER OF THE GUILD OF AIR PILOTS AND NAVIGATORS OF THE BRITISH EMPIRE ON OCT. 19, 1929.

CUTTY SARK

CABIN FLYING BOAT.

THE Cutty Sark . . . . . a flying-boat convertible to amphibian principles . . . . . is designed to appeal to all branches of civil marine aviation; regular air-routes, private ownership, hire services, aerial photography, fire patrol, etc.

The smaller Cutty Sark seats four people in a roomy enclosed cabin, the larger type accommodates eight, and either model may be equipped with one, two, or three engines according to performance required. The multiple-engined machines fly level even with one power unit out of action. Hulls are entirely of metal, designed to provide ready access to all equipment.

SAUNDERS-ROE likewise construct every marine auxiliary; refuelling tenders, petrol and oil scows, amphibian gear, floating docks for marine aircraft, high speed tenders, bomb-loading barges, and other seaplane servicing units.

He expressed his particular respect for navigators. Even second-class navigators had to be skilled mathematicians.

The present fashion of finding the way about a country by following the roads and railways was going to make air along those routes unhealthy. The wise pilot would navigate on a compass-course and keep away from them. The existence of this Guild might even make private owners learn to be navigators.

He said that he was particularly struck by the wonderful way in which the status of the Guild had been recognised so soon.

Lady Cobham also returned thanks for the Guests, saying that the first and only speech she had ever made at a public dinner had been such a success that she had decided never to make another.

The members of the Committee of the Guild present were the Deputy Master, Sq. Ldr. E. L. Johnston, O.B.E., A.F.C.; the Wardens, Mr. A. S. Wilcockson, Mr. O. P. Jones, Capt. A. G. Lamplugh, and Capt. Norman Macmillan, M.C., A.F.C.; and Honorary Members of the Court, Colonel the Master of Sempill, Sir Arthur Whitten Brown and the Reverend P. Donald Robins.

Among the guests were Sir Alan and Lady Cobham, the Honourable Mrs. Forbes Sempill, Mrs. Montague, Air Vice-Marshall Sir Vyell and Lady Vyvyan, and Mr. Alan Butler. The airship people were noticeably absent. Presumably they were all sitting round the mooring mast at Cardington waiting for R.101 to blow away.—C. G. G.

THE AIR NAVIGATION CLASSES.

At the first of the classes for Air Navigators, held on the evening of Oct. 21, thirteen students attended, one of them a woman. These classes will be held every Monday night until January, after which date they will be held on Mondays and Fridays.

There are still some vacancies in these classes, and those desirous of joining should communicate with Captain A. G. Lamplugh at the British Aviation Insurance Group, 3 and 4, Lime Street, London, E.C.3, enclosing five guineas.

THE APOTHEOSIS OF THE DO.*x*.

On Oct. 21 the Dornier flying-ship, Do.*x*, made a flight of nearly an hour with a crew of 10, 150 passengers and, as is now done, 9 stowaways, making a total of 169 persons. This is easily a record for aircraft of any kind, either heavier or lighter than air,—even to the number of stowaways.

The flight was made shortly after 11.00 hrs. at Altenrhein, on Lake Constance. The total loaded weight is said to have been 52 tons. The maximum speed attained was 170 km./hr. (105.6 m.p.h.), and the height reached was 1,200 ft. The time to take off was 50 secs.

The Do.*x* has twelve Siemens-built geared Jupiter engines, giving a maximum total h.p. of 6,300. With a full load of 52 tons this makes a power-loading of 18.5 lbs. per h.p. The wing-loading for this flight was 23 lbs. per sq. ft. (this includes the auxiliary wing joining the engine mountings).

The same figures for the Short Calcutta are 13 lbs. per h.p. and 11.2 lbs. per sq. ft. The Calcutta lands at about 56 m.p.h., while the landing speed of the Do.*x* may be as high as 90 m.p.h., and is certainly above 70 m.p.h.

With the big power-loading the ceiling of the Do.*x* is not likely to be very good.

Quite apart from these points the feat is notable, and definitely shows the feasibility of really useful-sized flying-boats,—or ships. One has little patience with the views of experts and others, as expressed in the daily press, who state there is no call for such big craft. Only by employing large craft can we reduce fares and increase the range.—T. J.

MUNICIPAL AERODROMES.

According to the latest list issued by the Air Ministry, there are now four cities with licensed aerodromes, and a further 88 have acquired reserved sites, or are awaiting the inspection of proposed sites.

The four cities with licensed aerodromes are Hull, Manchester, Blackpool and Nottingham.

Bristol has acquired a site at Whitchurch and is now far advanced with its preparation, and other cities with sites are Carlisle, Liverpool, Plymouth, and Stoke-on-Trent.

The following towns are negotiating for the purchase of sites: Burton, Cardiff, Hastings, Hereford, Ipswich, Portsmouth, Southampton, Southend, Sheffield and Worcester.

The following have reserved sites for aerodromes in their town-planning schemes: Basingstoke, Morecambe, Skegness and York.

Another 56 towns have shown active interest in the municipal aerodrome scheme. Of these 29 have had their proposed sites inspected, and there are another eight towns with possible sites awaiting inspection.

FATAL ACCIDENTS IN THE UNITED STATES.

American Aeronautical Journals are very reticent about fatal crashes, presumably a reaction from the scare headlines of the yellow press. The figures relating to flying fatalities in America during 1928 have been issued by the Actuarial Society of America and are therefore all the more interesting. *Aviation* of Oct. 12 has had the courage to publish them.

In the United States during the year 1928 some 50,000 people were carried on regular scheduled flights and of these 13 were killed,—roughly 1 per 4,000. During the same year British Air Lines (excluding the Cairo—Basrah route) carried 27,659 passengers without a single fatality. Other aircraft flying for hire in this country carried 97,619 passengers and killed one. There are no figures available in the United States for flights other than those made by scheduled air lines.

During the first half of 1928 the death-rate among pilots with Federal licences was 35 per 1,000, decreasing to 25 per 1,000 for the second half of the year.

The death-rate for pilots holding transport licences was 32 per 1,000. The fatalities to pilots holding limited commercial licences which restricts their activities to specified areas, were at the rate of 16 per 1,000. The rate for private licensed pilots was 8 per 1,000. Industrial or test pilots of whom there are about 50 suffered no fatalities. The highest rate of all is that of 45 per 1,000 for the mail pilots.

LINKING THE AMERICAS.

The New York-Rio de Janeiro-Buenos Aires Line has been formed in the United States to operate an air line between these cities.

The machine used is a twenty-seat twin-engined flying-boat built by the Consolidated Aircraft Corporation. The type is known as the Commodore and is essentially the same as the Admiral, a five-seat reconnaissance flying-boat, which was built under contract for the American Navy.

The first machine was christened the *Buenos Aires* by Mrs. Hoover some days previously to the start of its maiden voyage on Oct. 17 from Washington to its namecity.

THE REPORT ON CIVIL AVIATION.

[*Report on the Progress of Civil Aviation.* Issued by the Air Ministry, Directorate of Civil Aviation. Published by H.M. Stationery Office, and obtainable from The Aeroplane Book Department, Cannon House, Pilgrim Street, E.C., for 3s. 9d. post free.]

Events and developments move rapidly in Aviation. New records are made and smashed so quickly that the memory finds difficulty in keeping track of such things. The information of value and importance yesterday is but of academic interest to-day. The speed record of D'Arcy Grieg is of no importance beside the achievements of Waghorn and Orlebar. So, with this Report, for whose delay a Prefatory Note more or less apologises, one feels that the speedy issue immediately on completion of the year under review should be the first consideration, even if this meant omitting a certain amount of relevant matter.

The reader is confused, too, by certain references to events in the present year. We are nearly ready to read about 1929 now!

The Report opens with the statement that Imperial Airways continued with increasing success their services on the London—Paris—Zurich, London—Brussels—Cologne, and Southampton—Guernsey Routes. They must have been bored with their easily-won success on the last mentioned, because when they sent their new flying-boats to the Mediterranean section of the Indian Air Line they made no attempts to continue their service to the Channel Islands.

After chronicling the flights made on the Basrah—Cairo route and touching on the delays in opening up the rest of the route to India, the Report passes on to Miscellaneous Commercial Flying. Under this heading the operations of Surrey Flying Services, A.D.C. Aircraft, Ltd., and Air Taxis, Ltd., are mentioned. In this instance figures up to August, 1929, are quoted, and one wonders why these were not held over for this year's Report. The formation of N.F.S. is also noted.

The sound work done by the Air Survey and Aircraft Operating Companies is given much space. The amount of survey work done by these two concerns is remarkable. From the patriotic standpoint there is much on which to congratulate ourselves in that this particular branch of aviation has been developed more intensively by unsubsidised British interests than by any other concern or nation.

The year 1928 saw a 50 per cent. increase in the membership of the Light Aeroplane Clubs, and a 60 per cent. increase in the number of privately-owned machines. The approved Clubs increased from eleven to thirteen. The Automobile Association began its association with aviation in the same year by the formation of a special branch to help private owners.

The Report next gives the Records obtained by Great Britain in 1928. These were records for Height, and Speed over 100 km., captured by the Gipsy Moth, and the speed Record of Flt. Lt. D'Arcy Grieg.

The Report now refers to the important foreign achievement of crossing the Atlantic from East to West by the Junkers W.33, and then carries on to the important British long-distance flights. Well, of course, one may paraphrase the inimitable Beachcomber and say: "IT all depends on what you call British."

The flight of Mr. C. D. Barnard and Mr. E. H. Alliott in a Fokker FVII (Bristol Jupiter XI) is very nearly British but what about the flight of the *Southern Cross* from California to Australia? Apart from the crew, the machine was Dutch and the engines American.

One is endeavouring to find some ruling on the question of what decides the nationality of such efforts, the registration of the machine, the nationality of the *matériel*, or of the crew?

The year 1928 was a good year for these long flights. There were Mr. Bert Hinkler's tremendous solo trip to his own country, Sir Alan Cobham's Wakefield Survey of Africa in the Short-Rolls Singapore. There was Lady Bailey's Odyssey. Lt. P. M. A. Murdoch, S.A.A.F., made a record flight from England to Cape Town in an Avro Avian. Lt. R. R. Bentley completed multitudinous voyagings between the same countries in a Cirrus Moth.

The University Air Squadrons put up a good show, but owing to the fact that Cambridge obtained prior sanction for flying in term time, out of the 73 strength of each squadron, Cambridge had 45 soloists opposed to Oxford's 33.

The figures for Refresher and *ab initio* courses for Reserve Officers showed an increase of 53 and 41 respectively.

The Report comments on the increase in receipts and activity at Lympne Aerodrome due to the presence of Cinque Ports Flying Club, who, on the strength of this, ought to get a rebate of some kind from somebody or another.

One is interested to note in the Report an account of the steps taken by the Air Ministry to induce Airmindedness in Municipal Authorities. Such activity is now beginning to bear fruit, or shall we say that the seeds are up and with careful tending may bear fruit?

On page 24 the Report mourns the passing of the Light Aeroplane, brought about by the increase of engine power, and breathes a prayer for the coming of cheaper and lower-powered types. Although one feels that lower-powered machines would be nice, the same tendency to increase engine powers may be noticed among all the Continental types which are slowly creeping up to the powers of their English equivalents.

This question of horse-power is bound up with the need for a high cruising speed, and reliability. The first is made necessary by climatic conditions, and the latter is obtained by running an engine of 3 lbs. per h.p. at a comfortable cruising speed. In case the latter point may seem a trifle obscure, one would amplify it by saying that an engine of such a weight means proportionately greater power to obtain high cruising speed.

In March, 1928, as recorded in this Report, the D.H. Gipsy engine passed its type test. A few days ago a standard Gipsy engine completed 600 hours in the air without overhaul, an illustration of how quickly things develop in aviation!

In the section devoted to Airships, the comment is made that both the airships should be ready for operations at the end of the year. Was this a pious wish for the end of 1928?

The Report states that £415,000 was provided for expenditure in connection with Civil Aviation for the year 1928-29, which sum was a reduction of £49,000 as compared with the previous year, which was due to the decrease of capital expenditure at Croydon.

Imperial Airways received £137,000 for their European services and £93,600 for the Cairo-Basrah part of the business. Light Aeroplane Clubs got £16,000. The cost of staffing and maintaining civil aerodromes, mostly Croydon, presumably, was £29,000. A similar sum was allocated to aerial routes, surveys, experimental services, etc., £93,000 went for works services (mostly reconstruction at Croydon), £14,364 paid for H.Q. staff, and £2,000 for Miscellaneous Services.

The following licences or certificates were current on December 31, 1928—Pilots 821, Navigators 15, Ground Engineers 524. Airworthiness (heavier-than-air machines), 611—which figure included 305 for machines sold abroad. Aerodromes 77.

Of these aerodromes, 5 were Government-owned, 16 privately-owned, 7 were club aerodromes, and 49 were for joy-riding.

There were twenty-nine accidents to civil aircraft in 1928, and of these seventeen were due to pilots' errors of judgment. Engine-failure was a primary cause of only two, and in neither case with fatal results.

This part of the report makes extraordinarily interesting reading, as a brief and explanatory account of every accident is given. Limitations of space prevent one from saying much more except to give a brief analysis of the accidents.

Twelve resulted in loss of life, and of these, half happened to machines attached to Clubs. Six accidents resulted in severe injuries, and the remainder had no serious consequences other than structural damage to aircraft. Seventeen people were killed as a result, and of these, none were passengers travelling in British aircraft on scheduled services.

The section devoted to British Aviation then closes with a number of tables, from which one gleaned (as a sidelight) that July is easily the best month for joy-riders, and August is the best month for the scheduled air-lines.

The total Civil Aviation Vote in Australia for 1928-29 was £100,000. The subsidised services operated in 1928 were between Perth and Derby by West Australian Airways, Charleville—Camooweal and Cloncurry—Normanton, by Quantas and Adelaide—Cootamundra, Mildura—Broken Hill and Hay—Melbourne by the Larkin Aircraft Supply Co. Ltd. Quantas also operated an unsubsidised service between Brisbane and Toowoomba.

This 1928 Report now gives some 1929 information. The contract for the Adelaide—Perth service was let to West Australian Airways, and the weekly service started on May 29, 1929. The company will receive 12s. 8d. per lb., for the carriage of mails, and are guaranteed 600 lbs. per trip. When the weight of mails exceeds 800 lbs. on each trip over a period of four months, the guaranteed load will be increased to 1,200 lbs. per trip. The Government has prepared the necessary landing grounds, and in addition will provide night lighting equipment to the maximum value of £12,000. W.A.A. is required to operate and maintain such equipment at its own expense. The contract is for a term of five years, after which twelve months' notice can be given by either party.

The Larkin concern have secured the contract for the

weekly Camooweal—Daly Waters service at a subsidy of 3s. 4½d. per mile for the whole of the three-year contract. This service is due to start this year.

Quantas secured the contract for the Charleville—Brisbane weekly service, which started on April 17, 1929. Subsidy is 3s. 3d. per mile for first year, 3s. 1d. per mile second year, and 2s. 11d. per mile for third year.

There are six Light Aeroplane Clubs, and 124 pupils obtained licences. At the end of 1928 there were 178 private pilots, 103 commercial pilots, 182 ground engineers, 122 aircraft, and 171 aerodromes.

The total Civil Aviation Vote in Canada for 1928-29 was £684,197. The following Winter air mail services are operated when ice makes navigation of the St. Lawrence impossible,—Two trips a month between Seven Islands and Anticosti by Canadian Transcontinental Airways, Ltd., a six-days-a-week service between Leamington and Pelee Islands by London Air Transport, weekly service between Moncton and Magdalen Islands by Fairchild Aviation; twice-a-week service between Quebec and Seven Islands by Canadian Transcontinental Airways, Ltd.

Canadian Airways Transcontinental also operate regular air mail services between Rimouski and Montreal and Montreal and Ottawa. The Fairchild Aviation Ltd. operate a six-weekly mail service between Montreal and Toronto, and Canadian Colonial Airways Ltd. who are a subsidiary of the American Colonial Airways Corp., operate a service between Montreal and Albany (New York) daily. Western Canada Airways Ltd. have a weekly service serving the Cold Lake mining district, a twice-weekly service for the South-Eastern Manitoba mining district, and a weekly service for the Red Lake mining district in Northern Manitoba.

Mail to the extent of 283,163 lbs. was carried during 1928 by the air mail contractors. A large amount of passenger and freight carrying was done during the year by independent commercial concerns.

There are sixteen approved Light Aeroplane Clubs in Canada, of which fifteen were actually in operation, with a total membership of 2,400. During the year the Clubs completed 8,124 hours' flying, and obtained 111 private licences and 28 commercial.

A large amount of exploration, fire-fighting, aerial photograph, and the like was done by commercial firms under contract to the Governments.

By comparison with the intense activity in Canada, South Africa appears almost stagnant, though in 1928 Union Airways Ltd. received a three-years contract and £8,000 per annum to operate services between Cape Town, Port Elizabeth, East London, Durban, Bloemfontein and Johannesburg.

There are five Light Aeroplane Clubs in South Africa which are not subsidised

New Zealand in 1928 appears to have been in the throes of getting things done, 23 Light Aeroplane Clubs were formed, of which three were assisted by Government.

India was also getting things done and asking for tenders of a regular subsidised service weekly between Karachi and Rangoon. The Aero Club of India and Burma, which controls all Indian Light Aeroplane Clubs, received a subsidy of Rs.30,000.

The Aero Club of Kenya was reconstituted as the Aero Club of East Africa.

There are ten pages more of the Report devoted to Civil Aviation in foreign countries, and there is not enough space herein to deal with all this information. There is at the end of the Report a table giving a number of figures relating to regular air serivces, from which one has derived the following facts.

In 1928 the greatest mileage flown was by Germany, with 6,820,000 miles; the United States was second with 5,585,224 miles. Great Britain is sixth on the list, coming after France, Italy, and Russia with 1,135,910 miles.

One has worked out the rate of subsidy paid per mile flown. The highest rate is that paid by Italy, where 1,238,000 miles were flown at 8s. 5d. per mile. The next highest is Great Britain, with 4s. 5d. per mile. In spite of Germany's enormous mileage, she only pays 2s. 11d. per mile. The United States, with her five and a half million miles, pays only 3s. 3½d. The lowest rate of all is that paid by Switzerland—7d. a mile is paid for a total mileage flown of 330,600.

With regard to the above figures, one should especially note that the mileage figures for the United States only are those for air mail services. No subsidy figures are available for Russia.

In connection with these figures, one should note that both in Germany and Switzerland the rate per mile is for Government subsidy. In Germany the States and Municipal authorities contributed a further £460,790, which makes the rate 4s. 3d. This comparable with the British figure.

There is certainly good meat in the Report, but it has been hung a little too long.—T. J.

THE LONDON TERMINAL AERODROME.

ANALYSIS OF FIGURES FOR PAST WEEK.

Trips per Day.—Sunday, 12; Monday, 25; Tuesday, 26; Wednesday, 26; Thursday, 27; Friday, 25; Saturday, 25.

Imperial Airways Ltd.:

London—Egypt—India: London—Le Touquet—Paris—Basle—Zurich. London—Ostend—Brussels—Cologne and return: Machines 51, passengers 549, freight 24½ tons. India Route: Inward, passengers 1, mail 714 lbs; outwards, passengers 5, mail 793 lbs.

Air Union:

Paris—London and return: Machines 50, passengers 279, freight 20¾ tons.

K.L.M.:

Amsterdam—Rotterdam London and return: Machines 25, passengers 55, freight 7½ tons.

Corresponding week, 1920:
Machines, 111; Passengers, 192; Crews, 140; Total personnel, 332.

CROYDON NOTES.

A K.L.M. pilot on the Holland—Batavia Air Mail service posted a post-card to the K.L.M. Croydon Manager by ordinary post, *not* air mail, just before he left Java for the return flight to Holland. Nearly a week after the pilot had arrived back in Holland the postcard reached Croydon Aerodrome.

The Editor wants more stories from pilots, but after canvassing a number of bird-men and getting "There was a young lady of Wapping" six times and several versions of that vexed problem, "what the young lady said to the military gentleman" and also accumulating a fund of knowledge about the curious habits of the Scotch, the Irish and the Jews, one can but conclude that pilots do not have adventures these days, except perhaps in the Lido Club.

An interesting bit of news comes from Holland. It is said that Waalhaven Aerodrome will possibly be done away with in favour of a site midway between Rotterdam and the Hague, both of which are highly important cities to commercial aviation in their different ways. It is also said that Waalhaven, being right on the Rotterdam docks, is needed for Dock extension.

A few days ago an air liner was about to depart, the chocks having already been withdrawn. Suddenly an agitated steward appeared in the doorway followed by an extremely agitated passenger. The steward was understood to say that the passenger was suffering from hydrophobia, but nobody had been bitten yet. The usual tests with bits of meat and bowls of water met with no response.

Digitized by Google

After some heated dialogue it was discovered that the passenger was suffering from claustrophobia and could not travel in a closed cabin. His luggage and impedimenta were unloaded by a deeply suspicious steward and the passenger left for London again, presumably in an open car.

No responsibility is taken for the detail of this case, though the main fact is strictly accurate.

A learned judge, who was recently asked for a spot of bail for some financiers on the grounds that such a strict watch was kept at the Ports that they could not get out of the country, refused for the remarkable reason that "It is no longer necessary to go to a port to get out of the country. If you have the means," he said, "you can go by air."

It is about time even our judges realised that Croydon is a Port in every sense of the word, and that it is perhaps the most difficult port in England to slip away from to the Continent unobserved. Home Office and C.I.D. supervision are remarkably keen at Croydon, and as there are comparatively few passengers individual scrutiny is possible.

No financier, even shorn of his symbolic spats and disguised in a cloth cap, can hope to drift through amongst a large gang of the cheaper type of passenger, and it seems heartless of our judges to stimulate such hopes of quick get-aways by air, in the artless bosoms of other financial gents.

On Saturday afternoon last one took the air in the Air Express single-engine Junkers with one G.D. It was an extremely pleasant flight, marred only by G.D.'s efforts to locate his ancestral mansion, which he spotted respectively in Purley, Caterham and Upper Warlingham. If G.D. finds as much difficulty in finding his residence from ground-level when returning from the office "of an evening," he must frequently make desperate efforts to go to bed in the front rooms of other people's houses situated many miles away from his own. A practice liable to be misunderstood by all concerned, one would say.—Spry.

"PLEASE TO REMEMBER—ETC."

Towards the latter part of the year 1605 several sportsmen, under the leadership of one Robert Catesby, were planning to get certain High Authorities into the air through the medium of one Guido Fawkes and the timely application of a match to barrels of gunpowder placed under a gathering of the aforementioned Authorities.

Whether Mr. Fawkes forgot to place his usual order with his local newsagent for the Special Issue of whatever corresponded to The Aeroplane of that date, and thereby had not the knowledge contained therein, history does not tell—however, his aerial policy was a failure, and instead of being hailed as a pioneer of Civil Aviation, he is now remembered each year by flashes and bangs accompanied by the vocal complaints of all the neighbouring dogs.

The thought of what might have been must have entered the heads of the gentlemen who sat above those barrels, and the question of where they would land if they had been blown sky-high, must have occurred to them. Anyway, this year, on November 5, we shall see a similar gathering of Municipal Authorities threshing out the question of landing-grounds and air-parks, so that each town shall have facilities for the safe descent of its officials each time they take to the air.

Unlike the meeting of 1605, this is bound to be a success because of the Special Air-Park Issue of The Aeroplane which is being brought out for the guidance of those concerned with the planning of Air-Parks. May we therefore impress upon those who have not already ordered their copy of The Aeroplane for October 30 the necessity for so doing, as there is bound to be an enormous demand for it.—L. W. N.

A FLIGHT IN THE JUNKERS LIMOUSINE.

During the week-end, by the courtesy of Air Express Ltd., one had a flight in the Junkers 6-seater limousine which was described in a recent issue of The Aeroplane. The pilot and a passenger or navigator sit in an enclosed cockpit in the nose of the machine behind the engine and as the aeroplane is a low-wing monoplane they get a perfect view over the whole of the forward hemisphere. The four passengers sit in a comfortable saloon from which they can communicate with the pilot through a small window.

The pilot on this occasion was Mr. I. N. C. Clarke, of Air Express Ltd., who is chief pilot of the Air Express taxi service. There were four of us in the cabin, including Mr. H. Spry Leverton, London manager of the K.L.M. The day was foggy, and it was impossible to see further than the boundary of the aerodrome from the sheds.

The machine was off the ground in four seconds and climbed quickly at a flying speed of between 70 and 80 m.p.h. It cruises at 110 m.p.h. and has a top speed of over 120 m.p.h.

As the petrol is carried in the wings and there are no leads near the cabin, and as the structure is all-metal, the fact that smoking by passengers is allowed is noted on the C. of A. This should definitely be a selling point to the average traveller, who has always found the non-smoking regulation irksome.

After flying around over the Surrey Hills in the fog we climbed presently to 5,000 ft. and found ourselves in clear air and bright sunshine, and one of the advantages of the aerial limousine was well demonstrated.

We came down with a long glide at about 70 m.p.h., and the machine actually touches at something under 50 m.p.h. On touching it pulls up very quickly.

In the air the cabin is quiet enough to make conversation easy.—G. D.

NEW COMPANIES.

Aero Petrol and Petroleum Co. Ltd.—Private company. Registered Sept. 26. Capital, £300 in £1 shares (50 7% cumulative preference and 250 ordinary). Objects: To carry on the business of manufacturers, producers, storers, and refiners of all kinds of petroleum, petroleum products, oils, greases, soaps, paints and oleaginous and saponaceous substances, petrol and all kinds of spirit for driving motor-cars, aeroplanes or other engines, etc.

The directors are: W. R. Jenkinson, 51, Havelock Square, Sheffield. C. H. Stockdale, 13, Stoke Street, Sheffield. Mrs. M. Jenkinson, 51, Havelock Square, Sheffield. Secretary: W. R. Jenkinson. Solicitor: W. E. Dyson, 2, Meetinghouse Lane, Sheffield. Registered office: Aero Petrol Station, Effingham Road, Sheffield.

Air, Marine and River Craft Finance and Insurance Office Ltd.—Private company. Registered Oct. 8. Capital, £5,000 in £1 shares. Objects: To carry on every kind of air, marine and river craft insurance business, whether on the principle or basis of fixed premiums, mutual insurance or otherwise in respect of all kinds of air, marine and river craft, whether registered or not, and in respect of their cargoes, outfit, and gear or the outfit and gear belonging to any persons on board and all other risks incidental thereto, save as enumerated in Section 1 of the Assurance Companies Act, 1909, and except such classes of insurance as require a deposit under that Act. The directors are: J. Hetherton, senr., 6, Belvoir Terrace, Scarborough, underwriter (permanent director and chairman). J. Hetherton, jnr., Museum Street, York, insurance manager. Solicitor: A. M. Jackson and Co., Hull.

PERSONAL NOTICES.

Forthcoming Marriages.

COHU—BOWLY.—An engagement is announced between John Messurier Cohu, R.A.F., and Barbara, only daughter of Mr. and Mrs. R. T. Bowly, Whyteleafe, Surrey.

MACKAY—ELLERSHAW.—The engagement is announced between Flt. Lt. Malcolm Bruce Mackay, R.A.F., younger son of the late Rev. E. B. Mackay and of Mrs. Mackay, of Worplesdon, Surrey, and Katharine, third daughter of the late Brigadier-General W. Ellershaw, R.A., and of Mrs. Ellershaw, of Wymering, Cosham.

Birth.

MILEY.—On Oct. 17, at Summit Cottage, St. Mark's Hill, Surbiton, to the wife of Wing Cdr. A. J. Miley, R.A.F.—a son.

Marking a New Era of Progress in Wheel Construction!

THE
DUNLOP
PATENT
AEROPLANE DISC WHEEL

THE many advantages of the Dunlop Disc Wheel have made an instant appeal to Aeroplane manufacturers. Its introduction marks a very definite advancement in the design and construction of landing wheels for aircraft. Dunlop Aeroplane Disc Wheels are stronger and lighter than any other type; provide an excellent streamline contour; are easily adaptable to all forms of brake equipment within the contour of the wheel.

The combination of Dunlop Aeroplane tyres and this new disc wheel makes the perfect unit.

ON AIR-PARKS.

Within the next five or ten years a town without an aerodrome will be a curiosity as quaint as a town without a railway station and without a motor parking-place would be to-day. And this will be true not only of the more thickly-populated countries but of every agglomeration of houses bigger than a small village all over the World.

In fact there will certainly be in many parts of the World quite reasonably large towns which will have excellent aerodromes and probably no railways at all. Motor haulage has been so much improved within the last few years, thanks to the development of six-wheelers and caterpillar tracks and so forth, that quite important townships may well arise in Africa and Australia and South America, and even in North America, which can be perfectly well supplied with goods by motor haulage and can be reached by passengers in aircraft in one-fifth of the time, or even less, that they could be reached by ground transport even if roads and railways existed.

Therefore the time seems to have come when THE AEROPLANE, in accord with its consistent policy of keeping in front of the times and telling its readers what ought to be done, gives this particular issue to the discussion of the finding, planning and organising of Air-Parks.

The word Air-Park seems to be on the whole preferable for ordinary purposes to the word Air Port or Aerodrome..

An air port should, properly speaking, be a place of entry into a country, or at any rate into a great manufacturing area. It should imply the existence of a Customs House and of a Police Station at which the entry of undesirable aliens can be checked, and all the other paraphernalia which distinguish a sea port from a seaside resort.

The word aerodrome should be used simply as a generic term for a place where aeroplanes run. Air ports, air-parks, landing-grounds without accommodation for man or machine, and places where private owners habitually land or start in their aeroplanes, are all equally aerodromes.

WHY AIR-PARK?

The compound word air-park has much to recommend it. If the local aerodrome is called the air-park it is much more likely to attract visitors, because the word park gives the reader or hearer subconsciously the impression of a place of public resort. And so the local inhabitants may be the more easily induced to come and sit around there on a pleasant afternoon and watch the flying, occasionally going themselves for what is commonly called a joy-ride.

There are to-day in England, and still more in other parts of the British Isles, in spite of wireless and gramophones and bicycles and motor-cars, plenty of places where the daily amusement of the indigenous inhabitants is to go to the railway-station and see the evening trains come in. Similarly, we may quite well expect that when there is nothing particular doing people will go to the local air-park to see the aircraft come in.

These arguments, one may add, were first publicly put forward by Mr. Lester Gardner, at one time proprietor of the leading American aeronautical paper *Aviation*. And

"SURER TO PROSPER THAN PROSPERITY "COULD HAVE ASSURED US."—MILTON, *Paradise Lost*.

A COMMERCIAL PROPOSITION.—Heston Air-Park, a modern aerodrome, laid out with the newest ideas, to meet the needs of the newest methods of transport. Overhead is a De Havilland Moth (Gipsy engine)—the most profitable of commercial aeroplanes—belonging to Airwork Ltd. And it is fitted with Graham Wireless,—also the latest of commercial ideas.—(*"Aeroplane" photograph.*)

there seems no reason to-day to disagree from them. Therefore as a first suggestion to those who are beginning to take an interest in the establishment of aerodromes one would advise that they call their aerodromes air-parks and do everything possible to make those air-parks as attractive as are other municipal parks of all kinds.

If a municipality is going to spend the rate-payers' money on an air-park it may just as well arrange at that park some way of making money out of the visitors. This may be done in several ways. There may be a special reserved enclosure at a small entrance fee, there may be a small fee for parking cars, there may be a municipal tea-shop. If any municipal authorities want to know how to make money out of indigenes and visitors alike, one recommends them to go and take a few lessons from the Corporation of Blackpool, who are past masters of this art.

The Aerodrome Campaign.

In presenting this Air-Park Issue of The Aeroplane to the regular readers of this paper, as well as to the many hundreds of municipal authorities all over the British Empire, to whom it will be sent, one wishes first of all to make clear that it has been produced primarily with the intention of backing up the campaign for aerodromes and landing grounds all over Great Britain which have been so splendidly begun by Sir Alan Cobham and Sir Charles Wakefield.

Sir Charles Wakefield has rightly been called the Patron Saint of British Aviation. Nobody will ever know quite how much he has spent in prizes for competitions, in giving aeroplanes to flying-clubs, in contributing to the racing funds of the Royal Aero Club, and in financing voyages of exploration all over the Empire. Still less is anybody ever likely to know the great sums which he has given away in private charity. But none of all the money that he has spent for the good of British Aviation will in the end have been better spent than that which he has given towards this campaign in favour of local aerodromes.

Sir Charles is pre-eminently a business man, and even when he gives money away most generously he likes to see that it is spent to the best advantage. So the amount of his contribution to this campaign has, one is told, been given on a strictly piece-work principle. That is to say, he has paid on that principle for the carrying of all the youngsters whom Sir Alan Cobham has taken up in his now famous De Havilland Giant-Moth (with its Armstrong Siddeley Jaguar engine), named, very appropriately, *The Youth of Britain*.

In this campaign, in which Sir Alan has visited just on 100 towns in Great Britain, two generations of citizens have been educated to understand the value of municipal air-parks. First of all, Sir Alan has taken up the Elders of the People, the Lord Mayor or Mayor, the Councillors or the Aldermen, and those all-important, permanent officials, the Town Clerks and the City Engineers or Borough Surveyors. And then he has taken up flocks of children.

Thus the mere people of each place will be influenced from both sides to consent to the expenditure of their money on local aerodromes. On the one side the municipal authorities will persuade them that an air-park, or at least a landing ground, is necessary for their municipal salvation, and on the other side the enthusiasm of the children will soften the severity of the rate collector.

Every good election-agent knows that the candidate who captures the imagination of the children is the one who wins the election. But Sir Alan has done more than merely buy the support of the youngsters. He has in fact laid the foundation in the rising generation for a proper understanding of the value of air transport.

Consolidating the Position.

By way of consolidating the position which has thus been won, Sir Alan Cobham (with the wisdom of a good Chief of Staff to Sir Charles Wakefield, as General Officer Commanding) has organised a Conference to be held in London on Tuesday next, to which have been invited the Lord Mayor or Mayor, the Town Clerk, and the City Engineer or Borough Surveyor, of each of the cities and towns and urban districts which Sir Alan Cobham has visited in this tour. And after the Conference Sir Charles Wakefield, with his usual boundless hospitality, is entertaining all these guests to dinner at the Savoy.

Thereafter, during the Winter months, all these various local authorities will be able to discuss the problem of their local air-parks in a properly informed way. That being so, we may now proceed to consider some of the points which they may discuss.

The Ideal Aerodrome.

Speaking at the lunch which he gave at Leeds recently in connection with the establishment of an air-park for that city, Lord Brotherton of Wakefield asked "What is the ideal aerodrome?" And this issue of The Aeroplane is intended to go some way towards answering that question.

In his able article which appears elsewhere in this paper Sir Alan Cobham gives some of his views on the subject. That is to say he gives as much of his views as he could spare time to put on paper in the rush of his campaign. And the readers of The Aeroplane will be duly grateful to him for doing so.

An Epic Story!

"THE RESCUES FROM KABUL

IT is impossible to read without a thrill the story told in the official report of the rescues from Kabul carried out by the Royal Air Force in December, January and February last.

In those winter weeks—destined surely to be famous for ever in the history of the Air Force—the great aeroplanes went to and fro, to and fro, in all weathers over mountainous country of the most forbidding kind, where landing was practically impossible and any sort of failure in skill or in material must have meant disaster. There was no disaster. In more than seventy journeys nearly 600 men, women and children were rescued, and not one suffered injury.

Henceforth it will not be difficult to connect the ideas of precision, punctuality, efficiency under the most exacting conditions, with transport through the element which hitherto men have regarded as more chancy than land or even sea. It is a great thing to have won the Schneider Trophy.

It is a greater thing, greater for the country and greater for the future of travel by air, to have effected the rescues from Kabul.

Not then for the first time, but then for the first time in that new and marvellous manner, and with a swiftness denied to both the older Services, neither of which could have sent help from Iraq to India in two days, those forces came to the rescue of men, women and children in peril; and no less than a great victory in battle, this triumph deserves to be emblazoned on the colours."

The Times, 8 *Oct.*, 1929.

VICKERS aircraft combined with NAPIER engines made these rescues possible.

Numerous other articles written by people who know their various jobs will give readers a fair working idea of the labour, mental and physical, which is needed in laying out and building and organising air ports and air-parks and landing grounds.

So much information on this subject has not yet appeared in any British publication, but lest the readers of this paper should imagine that we in this country are in any way pioneering this particular industry, one would point out that in the United States there exists a monthly publication called *Airports*, which deals entirely with the organisation, equipment and control of aerodromes without touching on the aircraft and engines used in air transport or the actual running of air transport services. That may give some idea of the extent to which air transport has already developed in the United States.

Furthermore, in this number of The Aeroplane no mention is made of the lighting of aerodromes or of illuminated routes for night-flying. The articles which appear herewith are intended to be purely elementary. Before we need concern ourselves with night-flying equipment of aerodromes and air routes we must reach a stage at which night-flying equipment of aerodromes is likely to be necessary.

The aerodrome at Croydon is fairly well lighted for night-flying, there is night-flying equipment of a sort at Lympne, and there are one or two lighthouses on the route between Lympne and Croydon. But we have no proper illuminated landing-grounds such as they have in the States and as they are building in Germany.

Before long we may have a lighted night-flying route across Arabia and across India. Also, when air-taxi work begins to develop in the British Isles, we shall have proper aerodrome lighting for the benefit of belated taxis. Also we shall probably have our intermediate landing-grounds indicated by flicker-lights showing upwards, but otherwise similar to those used on our arterial roads.

The problems of aerodrome and route lighting, and further details of aerodrome equipment, lay-out, management, and so forth will be discussed in future Special Air-Park Issues of The Aeroplane, which we of this office propose to produce at intervals of a few months. There is so much to be said on this subject that there is no room to discuss it in this particular issue, and, in any case, to do so would be premature.

We in the British Empire have even greater opportunities for the development of air transport, and considerably greater need for air transport, than exists in the United States. We have great undeveloped areas where air transport has only to compete with a very primitive railway system, and we have still greater areas where there is no railway system at all. And so whatever appears in this number of The Aeroplane, though it will seem elementary to the people who have been running air ports and air-parks in the United States for several years, will, one hopes, be quite new and interesting information to the majority of the readers of The Aeroplane.

Fixing A Site.

Obviously the first thing to do about a local air-park is to fix on a site as near as possible to the city or town which it is to serve. In his article Sir Alan Cobham has discussed fairly comprehensively the conditions which govern the selection of such a site. In particular it must be so situated that the aeroplanes of to-day can get into it and out of it safely. Within a very few years, unless all our aeronautical engineers go to sleep, we ought to have aeroplanes which can get into and out of an average football-field without trouble or risk. But in the meantime we have to reckon on making our air-parks fit for such aeroplanes as we have to-day.

And we must remember that even when we do get those aeroplanes which can get into and out of a football-field we shall still need quite big aerodromes. There will be so many aeroplanes using them that we shall need the area of several football-fields joined together so that we may have room for a number of aeroplanes to land and get off at the same time.

Therefore the site selected for an air-park should for choice provide a run of not less than 800 yards in any direction. A run of 1,000 yards will be still better. The boundaries of the site should be free from high trees and buildings. And the aerodrome should not be on the edge of steep-sided hills or mountains,—either below them or on top of them.

Central Stations.

Some day our aeroplanes may be so developed that they can land safely on aerodromes only two or three hundred yards square. Such aerodromes may then be built by the simple process of roofing over areas of that size in the hearts of our great cities.

Six or seven years ago at least Sir Sefton Brancker, our present Director of Civil Aviation, suggested that the London Terminal Aerodrome of the future would be formed by roofing over part of the area in Pimlico between Victoria Station and the Thames. A good many people thought that he was jesting, or, in modern slang, talking hot air. But in fact he was just talking plain common sense and looking a few years ahead.

In the meantime we do need big aerodromes. And even when we have our roof air-parks the big aerodromes will still be useful for flying training, and for testing new types of aircraft, and for trying-out machines which have been modified or overhauled, before putting them into service at the central stations.

Financial Considerations.

Municipalities will do well to remember that in any case if they buy their big air-park sites at the right price they cannot lose money on them, because if they are anywhere within reasonable reach of their cities or towns their value as building sites will increase steadily year by year. And so, if we should ever come to the state where aircraft can rise and descend vertically with complete safety, there will always be a profit to be made out of disused aerodromes.

While discussing this financial point one would suggest to local authorities who have duly selected a site for their air-park that the precise locality of that site should be kept dark. Many a good scheme of municipal expansion has been spoiled, or at any rate held up for a long time, by the premature disclosure of the municipality's intentions.

Speculators have bought positions which have entirely blocked some desired expansion or new road. And if the prospective sites of aerodromes are disclosed, obviously speculators will seize their opportunities, or owners will stick out for a big price.

The wiser course is that somebody who can be trusted should go and buy options on the desired land, as the agent of the municipality. He should be particularly careful to see that he acquires options on *all* the necessary land, so that there may be no Naboth's Vineyards sticking out onto the aerodrome and spoiling it. Paying an agent 10% is better business than paying a speculator 100% or 1,000%.

Placing Buildings.

When the site of the aerodrome has been acquired then comes the question of what buildings are going to be put on it and where they are going to be put.

The buildings themselves are of course an affair which is decided by the size of the city or town which is paying for them, or at any rate on the amount of money that is going to be paid. Nobody expects an ordinary English town to put up on air-port of the magnificence of Berlin's great central air station at Tempelhof. The illustrations and the various drawings in this number of The Aeroplane will give a pretty fair idea of buildings which already exist.

But there is one point which should be remembered by everybody who is laying out an air-park. The public enclosures *must* be placed so that the people in them have the afternoon sun on their backs. No air-park is ever going to be popular if the public enclosures face the sun and are turned into what, in American base-ball and football enclosures, are called "bleachers."

Almost all over the World the prevailing wind is from the West or South-west. Consequently people in enclosures built on the West side of the ground generally have the wind and always have the sun on their backs while they are watching the afternoon flying, and that helps very much to make an air-park a pleasant place of resort. In a well laid-out air-park the public enclosures should be between the main buildings and the aerodrome itself. Thus lookers-on would be under the lee of the buildings, and very often in the shade of the buildings.

If for some reason or another the buildings and enclosures cannot be put along the west side, then the organisers will be wise to put them on the South rather than the North.

Perhaps some readers have not realised that in almost all big towns and cities the West End is the fashionable and expensive end because the prevailing wind keeps it clear of smoke and dirt.

The Importance of the West End.

Also, because the prevailing wind is from the west or south-west, and consequently the aircraft will be taking off in that direction most of the time, care should be taken in arranging the buildings so that they do not interfere with the aeroplanes when taking off against the wind.

If there are trees or other obstructions which cannot be abolished at that side of the aerodrome, then the higher buildings ought to be put opposite those obstructions. Thus the buildings will not make an additional obstruction.

If there does happen to be one particularly favourable way out of the aerodrome,—especially towards open fields where an aeroplane can be put down easily without turning if the engine should happen to fail just after it has left the aerodrome,—then the line to that open space should be left as clear of buildings as possible.

Putting the enclosures on the West of the aerodrome naturally means that aeroplanes must take off over the heads of the crowd. In these days that is a fairly safe proceeding, and it rather pleases the on-lookers than otherwise. In some twenty years' experience of flying one has never yet seen an aeroplane come down actually in the public enclosure while trying to get off.

If an engine is not giving plenty of power to get the machine off long before it reaches the railings any pilot who is not a fool will have the sense to shut off before he leaves the ground. And if the machine does get off the ground properly, then it will generally have way enough on it to jump the enclosures. But now that so many people, some with money and no brains, are learning to fly, we must take more care than has been needed in the past, to provide for pilots who *are* fools.

One has seen pilots shut off their engines before leaving the ground and run into the railings of enclosures and one has seen pilots just scramble over the railings and come down just outside the aerodrome. But only once has one seen an aeroplane come down into an enclosure. That was a machine which got itself into an uncontrolled spin at Hendon before the War, when it was actually flying quite well. By a miracle it did not hit anybody although there were a great many people in the enclosure at the time, and it fell right onto a stream of people who were making for the gate as the flying was over.

COMBINED TRANSPORT.—The Air-Park of Columbus, Ohio, where Transcontinental Air Transport detrains its passengers from the night mail train out of New York and transfers them direct to aeroplanes for the day journey Westward.

Deplorable Examples.

Many of our existing aerodromes are just about as bad as they could possibly be in every way. What public enclosures there are at the London Terminal Aerodrome at Croydon face the sun and the prevailing wind, and they get all the dust of every machine that takes off.

No effort at all has been made to attract people to the aerodrome or to make them comfortable when they get there, except those who care to pay for refreshment at the local hotel,—which is quite a decent hotel in its way, but does not compare at all with the restaurants at Tempelhof.

Our other air port at Lympne is simply criminal. The take-off is uphill against the wind, and a heavily loaded machine one often finds that the hill climbs just as fast as the machine does. If a machine does not tear itself off the ground before it gets to the top of the hill it is caught by the downward curl of an airwave from the cliff which borders the South-West side, and is quite likely to foul the telegraph wires or trees on the edge of the cliff or come down in the road. If it does scramble over the trees through curl-over of the airwave, it gets a vertical jolt from the up-current from the cliff's face which is nearly enough to fetch the wings off, and has in fact been known to drive a passenger down through the seat of his chair.

Also there is no arrangement for food or drink at the aerodrome, and the sanitary arrangements are a disgrace to a so-called civilised community.

Fortunately most of our civil aerodromes are reasonably good. But it is typical of our way of doing things that our only two existing air ports should be about as badly arranged and as badly situated as they could have been if real intelligence had been spent on laying them out as awful examples of how not to do it.

Manchester has provided another example of how not to do things. The city is still trying to make an aerodrome out of, or rather in, Chat Moss,—a colossal bog into which the city's ashes have been tipped for years in the hope of filling-in undrainable land. The site can never be made a good aerodrome, and it can only be made usable as such by building runways of cinders. In some places the cinders go down to a depth of thirty feet or more. And at present good pilots on small machines can just use the aerodrome by being very careful.

Another thing to be avoided about aerodromes is having a road running across them. Such an objection is not vital. The club-house at Hanworth can only be reached by a road which crosses a part of the aerodrome, but as the aerodrome is private property and traffic can be kept under control it does not matter.

Several of our Service aerodromes have public roads across them. But they would all be better if their buildings had been so placed that such roads were avoided. Quite lately an accident happened through an aeroplane running into a car on the road across the aerodrome.

Run-Ways.

One thing which is of vital importance to the success of any aerodrome is the proper flattening and draining of the surface. No amount of draining will ever make some aerodromes fit for use in wet weather. But most aerodromes which would almost be unusable in any kind of weather, except those which people have foolishly tried to build on a fathomless morass like Chat Moss, can be made quite good in ordinary weather by adequate draining. And they can be made usable in the worst of weather by arranging proper run-ways.

In America very little trouble is taken about the surface of aerodromes, provided that the ground as a whole is flat and moderately well-drained. The actual getting onto and off the aerodrome is done on wide run-ways of concrete or tarmac or asphalt laid across the aerodrome so that one or other of them can be used in any direction of the wind.

A Bye-Product.

The institution of these run-ways have had one rather interesting effect on the design of American aircraft. In the ordinary aeroplane the pilot relies for a quick pull-up very largely on the tail-skid at the extreme end of the fuselage of the machine digging into the ground and acting as a brake. This naturally ploughs up the ground.

When big heavy air-liners are slewed about by opening up one engine or the other to turn them round sharply these tail-skids tear up a furrow very often a foot wide and five or six inches deep. And one has seen aerodromes so badly cut up in this way that the surface has become dangerous for light aeroplanes to land on because they have been liable to break their under-carriages bouncing across these furrows. In any sane country tail-skids would have been abolished years ago.

In America pilots now find that if they land on a concrete run-way their tail-skids do not act as brakes. They merely slide, and the machine runs and runs entirely out of control so that it runs off the edge of the fairway into the rough if the engine stops, and runs head-on into the sheds if the engine is kept going enough to give aerodynamic control through the rudder.

Also the concrete wears away the steel shoes on the tail-skids. And if the pilot lands with his tail up and then drops it on the concrete the shock on the tail-skid is so great that it is quite likely to break the fuselage.

The result is that practically every machine, except the lightest light aeroplanes, in the United States is now fitted with a swivelling wheel at the back, instead of a tail-skid, and has brakes on the front wheels. The result is that the machines can afford to land faster, and are therefore under better control in the air. And they can be pulled up quickly with the brakes. Also they can be manœuvred easily on the concrete or tarmac apron which is laid in front of the aerodrome buildings and sheds, or hangars.

These run-ways have another very great advantage. They enable aeroplanes to get off with a very much shorter run than they could from soft ground, or even reasonably hard grass-covered ground.

When Sq. Leader Jones-Williams and Flt. Lieut. Jenkins were getting ready for their non-stop flight to India in the Fairey Long Range Monoplane (Napier engine) they found that the get-off of the machine was very much affected by the state of the ground on any given day. So they tried

A GERMAN AIR-PARK.—The main hangar of Staaken Aerodrome, one of the three great aerodromes of Berlin.

Digitized by Google

me experiments with a fairly heavily loaded motor-car,—nning the car up to a certain definite speed and then put-ıg it out of gear and seeing how far it would run.

Taking an ordinary tarred road as 100%, they found at good grass brought them down to about 60% and that ·t ground brought them down to about 40%. That would , inversely, just about the difference between the distance ıich an aeroplane would take to get off a concrete tarmac run-way and the distance needed to get off dinary grass or wet ground.

Therefore one strongly recommends to all who are con-rning theqmselves with the lay-out of air-parks that they ould bring into their estimates from the start the cost of ying down run-ways across the aerodromes and of having good wide apron in front of the enclosures.

Furthermore, if machines can be kept on the apron and ıe run-ways, and can be prevented from running about on ıe grass in between, the run-ways and apron can be kept ırly free from dust. And consequently when the machines ·e getting off or manœuvring with their tails to the public ıclosures they will not be so unpleasant.

Height and Temperature Effects.

In this connection one would remind the readers of these ·ticles who are thinking of organising aerodromes in Central frica, and in very hot countries, that aeroplanes land much ıster and need a much longer run to get off in such coun-·ies than they do at home.

High up, or in great heat, the air is thinner. So it gives ·ss lift to the wings, and gives less material for the air-·crew to get hold of to drag the machine along, and there ; less air to get into the cylinders, with the result that the ngine gives less power. Therefore in such countries aero-romes have to be bigger and more care has to be taken hat they are free from obstructions immediately outside heir boundaries.

At 15,000 feet the atmospheric pressure is only half of what t is at sea-level. And the pressure, and consequently the lensity of the air, varies practically in proportion all the ·ay from that down.

Heat thins the air in the same way as great height does, ınd one has been told that some of the aerodromes used by he Queensland and Northern Territories Air Services in Australia, though only a few feet above sea-level, have ın atmosphere which is equivalent to being at 5,000 feet.

Building Materials.

One of the problems which will most concern organisers of air-parks is the question of what sort of material is best to ıse for the buildings. In these days of reinforced concrete the battle between the advocates of concrete and the advocates of brick and the advocates of steel structures is very nearly as bitter as the battle between the users of steel and the users of aluminium alloys among designers of aircraft.

The concrete people refer contemptuously to tin cans. The steel structure people talk equally of mud pies.

The concrete people say that steel structures corrode and perish and are liable to be blown over and so forth. The steel people say that if any alteration has to be made their buildings can be moved, whereas nothing will shift the concrete buildings except dynamite, and that, apart from that, steel buildings are just as permanent as concrete.

For the concrete buildings one can at any rate say that they are more pleasing to the eye and certainly have a good many structural advantages. On the other hand, steel and corrugated iron buildings are probably cheaper and quicker to put up.

So far as their permanency is concerned there is the interesting historical fact that the first sheds from which consistent flying was done in England, namely the sheds put up by Mr. G. B. Cockburn and Captain Fulton and shortly afterwards by the Bristol people on Salisbury Plain are still there, and so are the sheds put up by the Drexel and McArdle School at Beaulieu. These sheds have stood for very nearly twenty years and seem to be still weatherproof. Also we must remember that those sheds were of the most elementary corrugated iron type and do not compare at all with the modern type of iron building.

For aerodromes in the British Dominions where there are no local products, there is a great deal to be said in favour of buying sheds in this country which can be assembled on the spot with no more tools than spades to sink the uprights in the ground and spanners to tighten up the nuts which hold the pieces together.

Boulton and Pauls of Norwich, for example, have been famous for years for supplying bungalows for tropical climates, in all sizes, all nicely packed in bundles so that when they arrive on the spot the owner has nothing to do but put them up and bolt them together. More recently they have supplied quite large buildings for motor garages and such things on the same principle. And they have in fact supplied similar buildings for aeroplanes. So here is yet another alternative for builders of aerodromes.

Seaplane Stations.

Before very long people who intend to operate aircraft will have to consider the housing and handling of seaplanes as well as land machines. The Air Port of Hull for example is already faced direct with these problems.

Actually the arrangement of what have been called "sea-

A SEAGOING AERODROME.—A new type of aerodrome proposed by Mr. Armstrong of New York for use in Mid-Atlantic. The floats are sunk so deep that waves do not affect them, and the struts are so high that waves go under the platform as they do under the piles of a pier. The idea is practical and there should be many places in the British Empire where such aerodromes could be used with advantage near rocky coasts and in the middle of wide channels. Mr. Armstrong is seen here alongside a model.

Digitized by Google

dromes" is even a more complicated problem than is the arrangement of ordinary aerodromes. The proper placing of slipways and of sheds for such aerodromes needs an immense amount of study.

The effect of local tides has to be watched, not only in relation to their effect on seaplanes coming up to the slipways but also in their effect on the slipways themselves. When a solid slipway is built out into a tideway the tide may either silt it up or under-mine it.

One has seen perfectly good harbours built for fishing boats by well-intentioned Fishery Boards which have become perfectly useless within quite a few years either through their entrances being bunged up with sand or through their structures being under-mined by currents. And in every such case of which one knows, the harbours have been built on the advice of eminent scientists who have made a special study of tides and currents, and flatly against the advice of the local fishermen who knew all the tides by heart.

Therefore builders of seaplane stations will do well to consult the local seafaring people, even at the risk of the delay caused by dealing with the Marine Mind.

Having got the advice of the seafaring people then the organisers of the station have to consider prevailing winds and their effect on aircraft getting off or into available water. Under almost any circumstances a seaplane pilot has to be very much cleverer than the pilot of a land plane. Taxying an aeroplane up to a shed in a cross-wind is child's play compared with fetching a seaplane handsomely up to a slipway across wind and tide.

A New Art.

The whole subject of laying out, organising and equipping an air port is so immense that this Special Issue of The Aeroplane can only pretend to touch on the beginning of the subject. And air ports, air-parks and aerodromes are going to be increasingly important all over the Empire during the next few years. Therefore this number of The Aeroplane is issued in the hope that it will make readers all over the World think a little about the problems which are involved in the successful development of air transport.

We must all remember that historic dictum of Colonel Paul Henderson, the organiser of the great Trans-Continental Air-Mail route between New York and San Francisco,—"The success of an air line lies on the ground."

Proper ground organisation is essential. At the present moment, although there are so many aerodromes all over the World, air transport is still rather in the position that shipping would be if we had produced our modern Atlantic liners and our modern yachts, and only had harbours for them let us say at London, Bristol, Glasgow and Belfast in the British Isles with nothing nearer overseas than Gibraltar, Cape Town, Alexandria, and perhaps Marseilles and Trieste,—with on the American side harbours only at Quebec, New York, Rio and Buenos Aires. Imagine what sea transport would be like under such circumstances and how much use it would be in developing international trade.

Or imagine what motoring would be like if we had our modern cars with one garage only at York, on the way to Edinburgh and only at Bristol on the way to Plymouth. That is very nearly the state of air transport to-day. And one did one's earliest motoring when the conditions were in fact just that, and all repairs of very unreliable motors had to be done by the road-side.

Co-operation.

Because proper ground organisation is so important to the future success of air transport, and of sporting flying and air touring as well, one would ask all readers of this paper to co-operate in helping forward the development of ground organisation.

An article in the leading American aircraft paper *Aviation* the other day suggests that the time has come for the issue of definite specifications for air ports. The writer of the article suggests that the length and the width of runways, the maximum permissible slope of these runways or any other part of the field; the rapidity of drainage; the hardness of surface; the colour of runways, as affecting the night landing, ought to be settled. The writer of that article even suggests that we should look ahead and decide what unit of pressure the surface of a runway ought to be able to stand.

That one thinks is a council of perfection. But people who use aerodromes, such as air line pilots, and private owners who tour a great deal on the Continent, can help the movement very much by writing to The Aeroplane and letting us here have suggestions about anything which in their experience would help to improve aerodromes in general.

At intervals during the coming year we hope to publish other special Air-Park Issues of The Aeroplane, dealing with various matters which have cropped up during the intervening weeks, and these issues also will be placed in the hands of the people on whom the organisation of aerodromes will depend in the future.

Naturally one hopes that what they have read in this issue will induce them to become regular readers of The Aeroplane in future. But one quite recognises that busy men such as City Engineers and Borough Surveyors cannot spare time to interest themselves in the doings of ordinary aviators, and so we shall see to it that future issues of The Aeroplane do reach the people most concerned. In the meantime the users of aircraft can make their own work easier by letting us have all the suggestions which they want passed on to the builders of aerodromes.—C. G. G.

AN AUSTRALIAN LANDING-GROUND CAMPAIGN.

On April 10 a campaign to educate local authorities on the need for landing-grounds for aircraft was begun in Australia. The instigators of this campaign were Vacuum Oil Proprietary Ltd., and Louis Coen Wireless Proprietary Ltd.

The organiser was Mr. Beau Sheil, and the pilot was Mr. F. Roberts. Their first report reads as follows:—

As the result of the campaign, landing facilities in the 80 Victorian towns and the 60 South Australian towns visited have been listed at the Department. Twelve first-class aerodromes were located and 60 towns are putting works recommended in hand, or have the matter under consideration. The balance of the towns are too small to establish their own permanent ground, but are making paddocks available on which they intend to erect a wind indicator.

In many small towns it was obviously impossible to expect the few people to establish a permanent aerodrome, but we endeavoured to induce the local authorities at these places to provide a landing-ground mainly for business purposes.

It is hopeless to expect business houses to provide aeroplanes for their commercial travellers to work a country district and find that certain towns have to be missed because of no landing-ground being available. If part of the trip had to be done by motor car, then the motor car might as well do the whole lot.

In these towns a number of good paddocks were listed and a central site chosen for the erection of the wind indicator, so that pilots could get the wind direction and land on the paddock not under crop at the time. [Note:—A paddock in Australia may cover hundreds of acres.—Ed.]

Where grounds were suitable for immediate use Councils were advised to lay down the triangle "sighting-sign" as directed by the Department. Owing to the large number of landing-grounds that are in various stages of completion, it appears to us that it would be a good idea to have, say, six standards, the ground being marked in white inside the circular or triangular sign on the ground. This should be both a guide to the condition of the ground to the pilot, and also would provide an incentive for each town to improve its ground until it is marked a first-class one.

We have submitted to the Department of Civil Aviation detailed reports and maps (in addition to a copy of the summary attached hereto) in connection with all towns visited, but owing to the limited time available for inspection, doing two, and sometimes three towns a day, we have not been able in some cases to send as much detail as we intended. However, we have notified Capt. Johnson, Inspector of Aerodromes for the Department, that should any difficulty or query arise in connection with any of the grounds, we shall be pleased to render such assistance as we can from time to time.

We found the printed invitations that were forwarded to the Mayor of each town for the purpose of inviting leading citizens to the presentation of the wind indicator, of great assistance in arousing local interest. This, together with intensive Press publicity, was of great assistance to us in our efforts to convince owners of suitable land of the potential value to the town, as well as the national value, of making their land available for an aeroplane landing-ground.

After convincing the local authorities of the absolute necessity for provision to be made for future air traffic, and pointing out that the Department of Civil Aviation were unable to provide aerodromes in all the towns, we endeavoured to interest them in the following objectives:—

(1) The establishment of an aerodrome or landing-ground for *all types* of aircraft.

(2) To have the aerodrome on Council property, or, failing this, under Council control.

(3) To adopt a policy of continual improvement to the ground selected.

(4) Where possible, to make available facilities for communication, such as telephone.

(5) To erect a wind indicator.

(6) To discourage the charging of landing fees.

Where money had to be spent on works, we were careful to recommend that application be made to the Comptroller of Civil Aviation asking for the services of a properly authorised inspector to approve of the proposed site.

A great deal was accomplished by enlisting the co-opera-

BULLDOG

ALL STEEL SINGLE SEATER FIGHTER

FOR DAY AND NIGHT MILITARY OPERATIONS AT HIGH ALTITUDES, HAS TAKEN THE FOREMOST PLACE AMONG THE WORLD'S HIGH PERFORMANCE MILITARY AIRCRAFT. THE SIMPLICITY AND EXCELLENCE OF THE DESIGN AND WORKMANSHIP, TOGETHER WITH EXCEPTIONAL PERFORMANCE, MARK THE MACHINE AS THE MOST EFFICIENT SINGLE-SEATER OF THE PRESENT DAY. EASY TO MAINTAIN AND REPAIR IT IS IDEAL FOR SERVICE IN ANY CLIMATE, AND WILL WITHSTAND CONDITIONS THAT MAY ORDINARILY BE CONSIDERED ADVERSE TO FLYING OPERATIONS. RELIABILITY IS ASSURED BY THE INSTALLATION OF THE WORLD FAMOUS JUPITER AIRCOOLED ENGINE——EITHER THE SERIES VI OR THE SERIES VII (SUPERCHARGED) ENGINE CAN BE FITTED, THESE BEING ENTIRELY INTERCHANGEABLE. THE EQUIPMENT IS ACCESSIBLE AND EASILY INSPECTED. THE MACHINE IS EASILY FLOWN, POSSESSING A DEGREE OF STABILITY AND SUCH CONTROLABILITY AS TO ELICIT THE HIGHEST PRAISE FROM PILOTS WHO HAVE TAKEN IT FROM THE GROUND. THE BULLDOG IS DESIGNED AND MANUFACTURED BY

The Vickers-Reid Control Indicator

An essential instrument for flying in conditions of poor visibility.

Captain C. D. Barnard, who in seven days with Her Grace The Duchess of Bedford, recently flew from England to India (Karachi) and back writes :—

"**The Reid Control Indicator was invaluable** - especially considering the fact that a great deal of **the journey was flown in clouds or in dust storms, it worked perfectly** and I should insist upon a 'Reid' being fitted to any machine if I were to contemplate a similar flight on it."

August 17th, 1929.

tion of various influential organisations, thereby increasing the local interest and enthusiasm. This was particularly successful at Ballarat, where we were successful in establishing a landing-ground in a very short time.

The co-operation of the local Rotary Club, A.N.A. Society and the Returned Soldiers' League were obtained, and clearing work was commenced on the site selected the morning after our arrival. The President of the R.S.S.I.L.A. stated that all future relief given to distressed "diggers" would be by means of relief work on the aerodrome.

We also found that where prominence was given to the efforts of any particular town the civic pride and natural desire of other towns to "go one better" stirred local authorities into activity. The tremendous enthusiasm that steadily increased as the campaign progressed was really remarkable. In one instance over 4,000 people attended the presentation ceremony and selection of the L.G. site.

To foster this spirit publicity was fully exploited, both in the Press and broadcasting. Daily reports were broadcast every evening from leading stations, together with a list of the towns to be visited the following day.

Successful L.G. slogan competitions were also conducted in conjunction with the broadcasting stations. This did much to focus public attention on the urgent need of aerodromes.

In conclusion, we desire to record our appreciation of the invaluable help rendered to us by the country organisation of the Vacuum Oil Company, and, in South Australia, of the co-operation extended to us by the local Aero Club. The campaign has been a much greater success than even we anticipated, and we believe it has laid the foundation for the ideal of a landing-ground for every town.

MUNICIPAL RIVALRY.

The Times of Oct. 26 states that the possibility that Northern Air Lines, Limited, the company that has been operating taxi air services from the Wythenshawe temporary aerodrome, Manchester, since April this year, may transfer their headquarters to a new aerodrome at Liverpool, was indicated on Thursday by Mr. J. F. Leeming, a director of the company.

Mr. Leeming said that since April the company's machines had flown 1,000 hours, a distance of 17,000 miles, and carried 25,208 passengers without injury to a single person. Manchester, however, had not supported the enterprise at all well—only 12 per cent. of the passengers had come from that city, and quite as much work had come from Liverpool and Belfast, and a good deal more from Glasgow. Northern Air Lines, Limited, were considering very seriously the question of moving to Liverpool.

WHAT THEY SAY IN LIVERPOOL.

At a meeting of the Liverpool City Council last week a member of the Labour Party objected to the proposed aerodrome to be reconstructed at Speke, on the outskirts of the city, being placed under private control, and moved that inquiries should not be made from companies interested in flying as to the terms on which they would be prepared to run an aerodrome.

Councillor W. A. Robinson Vee said it was inconceivable that Liverpool should be behind Manchester, which had already got a municipal aerodrome, and Liverpool should not open the door to a privately run aerodrome on a Corporation estate.

Sir Thomas White, who prophesied that eventually there would be a chain of aerodromes round the city, said all they wished to do was to make inquiries from experts.

Sir Max Muspratt said he did not believe in going into an important matter with his hands tied. He would not bring forward an absurd proposition.

The Labour amendment was lost by 49 votes to 41.

MANCHESTER'S MUNICIPAL AERODROME.

Mr. Alan Goodfellow, writing in *The Manchester Guardian* of Oct. 28, on the subject of the Chat Moss Aerodrome (proposed), endorses the views expressed in THE AEROPLANE thus:—

Sir,—It is some considerable time since I voiced a solitary protest in your columns against the expenditure of too large a sum of public money on this project without due caution as to the probable returns.

Since that time the preliminary estimates of about £40,000 have, if I am correctly informed, been exceeded to an extent which few of the general public know of. Furthermore, we are now informed that Northern Air Lines Ltd., for whose immediate benefit the expenditure would have operated, are seriously contemplating a move to Liverpool.

Mr. Leeming, who is in a position to know the facts, tells us, in his own words, that "the commercial flying needs of Manchester could be supplied by one small Moth." It is to be feared that this statement is more or less true of most of the cities in England at the present day. Commercial aviation is slowly and surely expanding, but it is subject to certain definite limitations and disadvantages in this country which will not be removed until such time as aeroplanes can arrive at and depart from limited spaces, such as a flat roof, in the centre of the districts which they serve. When this time comes—and it is probably not so far distant as many people imagine—the day of such aerodromes as Chat Moss will be already past.

For the cost of the Chat Moss scheme Manchester could probably have purchased the freehold of the Avro aerodrome at Woodford, have constructed their own additional hangar and workshop accommodation, and have turned it into a first-class commercial aerodrome by the building of a new approach road connecting up with the main Bramhall-Wilmslow and Poynton road. Had this been done, they would have been assured of at least two tenants in the shape of A. V. Roe and Co. Ltd., and the Lancashire Aero Club, both of whose interests are closely linked with the city's.

It is no good crying over spilt milk. The work on Chat Moss has gone too far to be abandoned, and has at least presumably had the merit of providing some work for the unemployed. It has brought a certain amount of publicity to Manchester and has put our city definitely "on the map" so far as the future development of aviation is concerned. For the rest, there is surely still time to limit the scheme to one which will meet the reasonable commercial aviation needs of Manchester for the next five years or so, and which will be capable of expansion should such expansion prove necessary.

My fear is lest the scheme prove so expensive in its present form, with so small a return on the money expended, that the authorities may come to feel that they have been misled as to the prospects. Such a reaction of feeling would do untold harm to the development of civil aviation in this part of the country.—Yours, &c.,

ALAN GOODFELLOW.

The Lancashire Aero Club,
Manchester, Oct. 26.

FLIGHTS TO KENYA COLONY.

The Royal Aero Club state that the Aero Club of East Africa, Nairobi, notify pilots proceeding to Nairobi that the aerodrome there is usually full of grazing game, which are liable to become a danger to aircraft landing there. The Aero Club of East Africa is prepared to arrange for the game to be driven off upon receipt of a wire notifying type of aircraft and proposed date and hour of arrival. At least three hours' clear notice should be given.

THE FIRST SHOT.

THE AEROPLANE continually hammers the point of gaining colonial markets by building the type of machine required. But it is as one crying in the wilderness, and no man regardeth.

The United States are already selling machines in Canada, and now they have started in South Africa. The following *Reuter* message, dated Oct. 25, makes the position pretty clear:—

Active American participation in flying in South Africa in the near future is indicated by the announcement in the *Cape Times* that an important agreement will be concluded to-morrow between General Motors (South Africa), Limited, and Union Airways, Limited. The latter company at present runs an air mail service between Durban and Cape Town.

General Motors recently purchased a substantial interest in the Atlantic Aircraft Company, who are the American concessionaires for the building of all types of Fokker aircraft. Union Airways have ordered from General Motors a Fokker Universal six-passenger machine.

FUELS FOR AERO-ENGINES.

A lecture will be delivered to the Royal Aeronautical Society by Dr. A. E. Dunstan, President of the Institution of Petroleum Technologists, on Thursday, Nov. 7, at 6.30 p.m. at the Royal Society of Arts, John Street, Adelphi, on "Recent Developments of Fuels and Dopes for Aircraft Engines."

Dr. Dunstan is one of the leading authorities in this country on the subject and is the chief chemist of the Anglo-Persian Oil Company.

RELICS REQUIRED.

Anybody who happens to have in his or her possession any portion of the aluminium structure of the first airship brought down in this country during the War 1914-18—commonly known as the "Cuffley Zeppelin"—is invited to communicate with the Editor of THE AEROPLANE.

The material must be thoroughly authenticated. Specimens are desired both of the lattice-work girders and of the corrugated sheet material which was used in other parts of the ship. A reasonable price will be paid for such relics.

AIR MINISTRY, *October* 22.

ROYAL AIR FORCE.

GENERAL DUTIES BRANCH.—The following are granted S.S. comns. as Plt. Offs. on probation, with effect from and with seniority of Oct. 11:—C. F. G. Adye, C. P. F. Alderson, I. O. Baldwin, J. N. Baxter, N. V. Bertram, B. W. E. R. Bonsey, M. Q. Candler, W. O. J. Coke, V. A. Dawson, C. C. M. Dunman, T. E. Dunville, F. P. R. Dunworth, N. Foster-Packer, H. M. Gahan, F. B. H. Hayward, N. Hill, M. V. Johnstone, N. D. Lamb, G. W. Lawson, D. MacGregor-Cheers, L. E. P. Mahon, D. E. Milson, W. S. Moody, P. E. L. A. Myers, R. W. H. Rayneau, E. G. Reed, P. A. Smith, J. F. Sutton, C. H. Williams, and S. M. Worrall. Lt. M. Cursham, R.N., is reattached to the R.A.F. as a Flg. Off., with effect from Oct. 9 and with seniority of June 16, 1924.

The following Plt. Offs. on probation are confirmed in rank (Oct. 12): J. Cherrill, R. P. Garnons-Williams, C. R. J. Hawkins, M. T. M. Hyland, B. A. Oakley, J. R. Stebbing, A. N. I. Worger-Slade. Plt. Off. H. C. Parker is promoted to the rank of Flying Officer (Sept. 17).

Wing Cdr. Sir Norman R. A. D. Leslie, Bt., C.M.G., C.B.E., is placed on the half-pay list, scale A (April 23 to July 24 inclusive); Wing Cdr. Sir Norman R. A. D. Leslie, Bt., C.M.G., C.B.E., is placed on the retired list at his own request (July 25).

Flg. Off J. A. C. Florence is transferred to the Reserve, Class A (Sept. 15). (Substituted for the notification in the *Gazette* of Sept. 17). Plt. Off. on probation C. W. Marriott resigns his S.S. comn. (Oct. 9).

STORES BRANCH.—Flg. Off. P. P. S. Rickard is granted a perm. comn. in this rank (Oct. 1).

ACCOUNTANT BRANCH.—Flg. Off. C. B. Rawlings, M.C., is transferred to the Reserve, Class C. (Oct. 22).

MEDICAL BRANCH.—The following are granted S.S. comns. as Flg. Offs. for three years on the active list, with effect from and with seniority of Oct. 1:—J. J. Corcoran, M.B., C. C. Fenton, M.B., B.S., B.Sc., C. G. Harold, M.B., A. Sheehan, M.B., D. D. Watson, M.B. E. A. Wilson, M.D., is granted a S.S. comn. as a Flg. Off. for three years on the active list, with effect from Oct. 1, and with seniority of Oct. 1, 1928.

CHAPLAINS BRANCH.—The Rev. H. Beauchamp, M.C., is granted the relative rank of Group Captain on appointment as Staff Chaplain (Roman Catholic) (Oct. 17). The Right Rev. J. Dey, D.S.O., is placed on the retired list at his own request (Oct. 17). The Rev. T. A. P. King relinquishes his S.S. comn. on account of ill-health (Oct. 28).

RESERVE OF AIR FORCE OFFICERS.

GENERAL DUTIES BRANCH.—The follg. Plt. Offs. on probation are confirmed in rank:—R. F. G. Lea (Sept. 3); H. Garnett (Oct. 16).

The follg. Plt. Offs. are promoted to the rank of Flg. Off.:—W. R. Walwin (Oct. 16); J. C. McE. Gibb (Oct. 19). Flg. Off. W. F. Parkinson is transferred from Class A to Class C (Sept. 30); Flg. Off. P. E. Nicholl is transferred from Class B to Class C (Sept. 12).

The follg. officers relinquish their commissions on completion of service:—Wing Cdr.: H. R. Raikes, A.F.C. (Oct. 11). Flt. Lts.: H. V. Stemmers, D.F.C. (March 10); D. C. Balfour (Oct. 1); R. E. Nicoll (Oct. 15). Flg. Offs. E. G. Richardson (April 20); H. W. Parker (Oct. 1); C. J. Watson (Oct. 1); W. J. Buchanan, D.F.C. (Oct. 5); C. W. Carleton, A.F.C. (Oct. 12). Flg. Off. J. M. Bell relinquishes his commission on completion of service, and is permitted to retain the rank of Flight Lt. (Aug. 7).

AUXILIARY AIR FORCE.

GENERAL DUTIES BRANCH.—No. 600 City of London (Bomber) Squadron.—The follg. Plt. Offs. to be Flg. Offs.: E. A. Burton (May 25); A. B. Ferguson (June 2).

Appointments.

Week ending October 29

GENERAL DUTIES BRANCH.—Air Vice-Marshal F. R. Scarlett, C.B., D.S.O., to H.Q., R.A.F., Middle East, to command, 12/10.

Air Commodores A. M. Longmore, C.B., D.S.O., to R.A.F. Depot, Uxbridge, supernumerary, 15/10. The Hon. J. D. Boyle, C.B.E., D.S.O., to H.Q. Fighting Area, Uxbridge, to command (temporarily), 12/10. W. R. Freeman, D.S.O., M.C., to H.Q., Inland Area, Stanmore, for duty as Chief Staff Officer, 15/10. W. G. S. Mitchell, C.B.E., D.S.O., M.C., A.F.C., to Air Ministry (D. of T.), on appointment as Director of Training, 4/10.

Group Captain R. E. C. Peirse, D.S.O., A.F.C., to Station H.Q. Heliopolis, to command, 25/9.

Wing Commanders A. C. Winter, O.B.E., to Aircraft Depot, India, to command, 8/10.

Squadron Leaders K. M. St. C. G. Leask, M.C., to Aircraft Depot, India, 8/10. N. S. Douglas, to H.Q., R.A.F., India, 8/10. L. N. Hollinghurst, D.F.C., to No. 1 (Indian) Group H.Q., India, 8/10. C. H. Pilot Officers P. B. Rogers to No. 25 Sqdn., Hawkinge, 3/10. J. W. Hawke to No. 20 Sqdn., India, 8/10. H. J. A. Williams to No. 31 Sqdn., India, 8/10. J. A. C. Stratton to No. 26 Sqdn., India, 8/10. J. H. Manning-Fox to No. 20 Sqdn., India, 8/10. W. R. Beaman to No. 5 Sqdn., India, 8/10. H. G. Richards to No. 28 Sqdn., India, 8/10. A. N. E. Hall to Armoured Car Section, Aden, 8/10. D. A. L. Campbell to No. 208 Sqdn., Middle East, 8/10. K. R. Coates to No. 202 Sqdn., Mediterranean, 3/10. H. M. Pearson to No. 202 Sqdn., Mediterranean, 3/10.

Medical Branch.—Squadron Leaders T. C. St. C. Morton, M.D., M.R.C.P., D.P.H., D.T.M., and H., to H.Q., 'Iraq Command, 8/10. T. R. S. Thompson, M.B., to H.Q., 'Iraq Command, 8/10. T. Montgomery, M.B., D.P.H., B.A., to R.A.F. Depot, Uxbridge, 1/10.

Flight Lieutenants J. P. Hederman to No. 100 Sqdn., Bicester, 13/10. R. W. White, to H.Q., R.A.F., India, 8/10. R. L. C. Fisher, M.B., to H.Q., R.A.F., India, 8/10. A. A. Townsend, M.B., to H.Q., R.A.F., India, 8/10. W. Gamblen (Quartermaster), to H.Q., 'Iraq Command, 8/10.

Flying Officers J. Kemp, M.B., to H.Q., 'Iraq Command, 8/10. C. Crowley, M.B., to H.Q., R.A.F., Middle East, 8/10.

Stores Branch.—Wing Commander C. L. Archbold to H.Q., Aden Command, for Stores Staff duties, 8/10.

Flight Lieutenants H. Cartwright to Aircraft Depot, India, 8/10. H. E. T. Crocker, to Aircraft Depot, 'Iraq, 8/10. R. G. Sims, to Aircraft Depot, 'Iraq, 8/10. R. F. Wilson, to Supply and Transport Services, 'Iraq, 8/10.

Flying Officers J. E. R. Sowman, to Aircraft Depot, 'Iraq, 8/10. J. McCarthy, to Aircraft Depot, 'Iraq, 8/10. C. W. H. Moller, to Aircraft Depot, India, 8/10. O. D. Allerton to No. 2 (Indian Wing) Station, India, 8/10. L. L. Bray, to No. 208 Sqdn., Middle East, 12/9. P. Dennehy to Stores and Supplies Depot, Aden, 8/10.

Accountant Branch.—Squadron Leaders P. J. Farmer to H.Q., R.A.F., Mediterranean, 3/10. A. R. Thomas to H.Q., Wessex Bombing Area, Andover, 4/10.

Flight Lieutenants R. F. C. Metcalfe to H.Q., R.A.F., Cranwell, 2/10. K. R. Money, O.B.E., to R.A.F. Base, Malta, 8/10.

Flying Officers F. Rigby to No. 8 Sqdn., Aden, 8/10. A. W. Younghusband to Aircraft Depot, India, 8/10. R. W. L. Glenn to School of Army Co-operation, Old Sarum, 22/10.

Chaplains Branch.—The Revd. G. H. Piercy, M.A., to No. 203 Sqdn., 'Iraq, 8/10. The Revd. A. W. Brown, M.A., B.D., to Station H.Q., Heliopolis, 1/9. The Revd. D. F. Blackburn, to R.A.F. Depot, Uxbridge, 8/7, instead of to H.Q., R.A.F., Cranwell, as previously notified.

Fatal Accidents.

The Air Ministry regrets to announce that as the result of an accident near Baghdad to a D.H.9a machine of No. 55 (Bomber) Squadron, Hinaidi, 'Iraq, on October 24, No. 336670, Cpl. William Walmsley, an occupant of the aircraft, was killed. The pilot, Flg. Off. Esmond John Hugh Fulford Moreton, was slightly injured.

The Air Ministry regrets to announce that as the result of an accident in the Firth of Forth to a Hawker Horsley machine of No. 36 (Torpedo-Bomber) Sqdn., Donibristle, Fife, on Oct. 28, No. 370380 AC.2. Robert Henry Wilson, an occupant of the aircraft, was killed. The pilot, Flt. Lt. Alexander Harold James Howlett, was slightly injured.

Royal Communications.

H.R.H. Prince George flew to Birmingham on October 25 in a Westland Wapiti of No. 24 (Communication) Squadron, R.A.F., piloted by Sq. Ldr. D. S. Don. He returned to London by air the following day.

Peace Factors.

Replying to the toast of "The Imperial Forces," at the annual dinner of the Jersey Society in London on Oct. 14, Air Marshal Sir John Higgins said that in the endeavour to keep peace as long as possible among the nations of the World the Air Force could help more than the other Services.

The more the British Empire was linked together the less likelihood there would be of another war on the scale of that of 1914. The only way that the British Empire could be linked together was by means of air transport.

Our newest airship, R.101, was an attempt to see whether we could quicken up transport between the Empire by means of the air. No one wished to claim it as a commercial proposition. The R.100 and R.101 were the first airships which had been built on scientific safe principles, to get the airships as safe as possible and then to cut down the weight and make improvements so that they could become commercial possibilities. The other airships were fundamentally unsafe; this ship was fundamentally safe. R.101 was a step in the right direction. [To be fundamentally safe by scientific calculations and then to fail because of a mere mechanical mistake is not so good as to be fundamentally wrong but practically sound.—C. G. G.]

After this work had been completed Canada, Australia, New Zealand, South Africa, and other portions of this great Empire would be in much closer touch with the heart of the Empire, Great Britain, than ever before. This must tend to ensure a greater certainty of peace in future.

Special Assessments.

The following officers have been awarded the special assessments shown hereafter on completion of a course of *ab initio* flying training at No. 5 Flying Training School, R.A.F.

Distinguished Passes:—Flg. Off. A. J. W. Geddes and Plt. Off. H. R. Hughes-Hallett.

Notation has been made in the official records of these officers.

The S.6 at South Kensington.

The Supermarine-Rolls-Royce S.6 which won the Schneider Trophy Contest in September has been lent by the Air Ministry for exhibition at the Science Museum, South Kensington, from October 26 to December 29.

Among other famous aircraft to be seen in the National Aeronautical Collection at the Science Museum are the

SPLASH!—A torpedo hitting the water after being dropped from a Hawker Horsley of No. 36 (Bomber-Torpedo) Squadron, R.A.F. The first British torpedo-dropping aircraft was the Sopwith Cuckoo, built by the Sopwith Aviation Company, the predecessors of the Hawker Engineering Co., the makers of the Horsley.

DOPED WITH

D.H. Moth.

CELLON

The Dope of proved efficiency

BROOKLANDS
SCHOOL OF FLYING, LTD.,
BROOKLANDS AERODROME,
BYFLEET, SURREY.

To Messrs. Cellon, Ltd.,
Upper Ham Road,
Kingston-on-Thames.

4th October, 1929.

Dear Sirs,

Now that we are approaching the end of our first financial year, we should very much like to take this opportunity of stating that throughout this time we have used nothing but dopes of all sorts supplied by you. During the period we have carried out a very great deal of repair work and overhauls and your materials have given extreme satisfaction, and they have played no small part in earning the reputation we have for turning out a good job.

Yours faithfully,
BROOKLANDS SCHOOL OF FLYING LTD.
(Sgnd.) H. S. HAMILTON,
Secretary.

Cerric Cellulose Lacque s comply with D.T.D. Specif cations for metal parts, cockpits, propellers. Particulars on application.

original Wright aeroplane with which the Wright Brothers made the first controlled and sustained flight under power on December 17, 1903, and the Vickers-Vimy Rolls-Royce aeroplane which made the first direct Transatlantic flight, on June 14-15, 1919.

A Compliment.

In commenting on the military flying at the Cleveland National Air Races which have just concluded an American journal, *Air Transportation*, says:—"Army Pursuit Squadron No. 1, the Navy 'High Hat' Squadron and a number of Marine flights, as well as Col. Charles A. Lindbergh, daily thrilled spectators at the Municipal Airport. By far the most thrilling show, however, was put on by the Canadians in their new all metal one-place fighting ships. Even Lindbergh's landing out of a loop paled perceptibly alongside of the foolhardy stunting of the men from the North-country."

These comments refer to a flight of the R.C.A.F. from Camp Borden mounted on Armstrong Whitworth Siskin III single-seat fighters (Jaguar engines).

No. 33 (Bomber) Squadron.

The Officer Commanding No. 33 (Bomber) Squadron is anxious to get into touch with members of the original No. 33 Squadron, R.F.C. and R.A.F., who have any documents or photographs which would be of use in compiling a history of the Squadron. He would be grateful for any war records, photographs, accounts of exploits by individual pilots, lists of officers, locations of the Unit, with rates, etc.

Original records of operation orders, or photographs which might be worth framing, would be much valued, and would be duly acknowledged to any individual who is good enough to present them to the Squadron.

Communications should be addressed to Wing Cdr. F. P. Don, No. 33 (Bomber) Squadron, R.A.F., Eastchurch, Kent.

No. 3 Squadron Re-Union Dinner.

The tenth annual re-union of No. 3 Squadron, R.F.C., and No. 3 (Fighter) Squadron, R.A.F., will be held at the Hotel Cecil on December 6, at 19.30 hours for 20.00 hours.

Air Chief Marshal Sir John Salmond, K.C.B., C.M.G., C.V.O., D.S.O., A.D.C., will take the chair. Air Vice Marshal C. A. H. Longcroft, C.B., C.M.G., D.S.O., A.F.C., has been invited as a Guest of Honour

Tickets, 12s. 6d. each (wines extra, gratuities included), will be obtainable at the dinner.

Former members of the Squadron who wish to attend are requested to inform Flt. Lt. J. L. Airey, D.F.C. (Hon. Sec., Re-Union Dinner Club), No. 3 (Fighter) Squadron, R.A.F., Upavon, Wiltshire.

The Great Yarmouth Re-union Dinner.

The tenth annual re-union dinner of officers of the Great Yarmouth Air Station (1913-1920) was held on Oct. 26. As no details have been received the presumption is that this re-union, like so many other similar functions, is dying a natural death.

Squash Rackets.

The Royal Air Force Club beat the Cavendish Club in the First Division of the Inter-Club Squash Rackets Tournament in the Cavendish Club court on Oct. 24 by two matches to one.

H. Coverdale (R.A.F.) beat D. G. McIntyre (Cavendish) by three games to none (9—1, 9—4, 9—4). J. S. Heagerty (R.A.F.) lost to G. D'O. Sheppard (Cavendish) by three games to one (9—6, 3—9, 2—9, 2—9). P. Q. Reiss (R.A.F.) beat P. de L. Cazenove (Cavendish) by three games to none (9—0, 9—1, 9—7).

AIR CO-OPERATION IN MOROCCO.

The Paris correspondent of *The Daily Telegraph* in a message dated Oct. 18, describes air co-operation during an engagement in Morocco between the 1st Foreign Legion and a party of rebels of the Ait Hammon tribe. The message states:—

Although taken by surprise, the French force fought desperately, and the tribesmen left many dead on the field beside the booty they had taken. But they were too strong for the Legionaries. Within a few minutes they had killed fifty men, and of the remaining twenty-five only seven escaped injury.

Fortunately for these seven and for the wounded, an aeroplane had been observing their movements. But for the prompt action of the airman not a man would have escaped to tell the tale. On seeing the trap into which the party had fallen, the pilot at once flew to the nearest post of the Legion and had reinforcements hurried to the scene.

Another detachment of French troops came up in the nick of time and put the tribesmen to flight. Subsequently further measures were taken to cut off the retreat of the rebels, whose movements were impeded by the fact that they were carrying their wounded with them.

The casualty list shows that forty-two Legionaries and eight native soldiers were killed, and fourteen Legionaries and four native soldiers severely wounded. The wounded were rushed to Colomb-Bechar with the exception of two who were in such a condition that they were taken by aeroplane ambulance to the hospital at Oran.

THE ART OF FLYING.

On Oct. 24, Mr. Norman MacMillan, chief test pilot of the Fairey Aviation Co., Ltd., read his paper on "The Art of Flying Landplanes and Seaplanes" before the Royal Aeronautical Society.

The meeting was very well attended, and as at the previous meeting, late-comers found seats with difficulty.

This should have been an inter-departmental occasion. One had hoped to hear furious debate between champions of "free air" and scientist defenders of the "standard" variety. But alas, the scientists stayed away and the discussion was mostly confined to the outlook of the practical pilot.

The absence of the technicians seemed extremely unfortunate. In the end the sole object and *raison d'être of* the technician is to put a man or men in the air within a contraption that shall convey its crew in a manner previously deemed desirable. One has always felt about sciences, and especially mathematical science, that the end should never be lost amidst the intricacies of the means. All science is a means to an end and *not*, as is generally accepted to-day, a commendable end in itself.

The pity was that the pilot should have had it all his own way,—but the technician by his absence failed to help in the formation of an *entente cordiale*.

Mr. MacMillan opened his paper with a dissertation on what was meant by Art and in particular those contributory factors that together form the Art of Flying.

His creed was not to despise the ability to fly which had been acquired through long practice, but most certainly, to encourage the study of flying so that skill may be attained through mental knowledge gained by means additional to the lengthy method of storing memory through the touch of hands and feet and the judgment of eye. He advocated strongly the mental-cum-practical method of flying instruction, because of the saving in time and the undoubted reduction in danger to the individual during the early stages of solo flight (anything up to several hundred hours) that such a method involved.

Mr. MacMillan next outlined the grave distinction that exists between the practical pilot and the technician. He said it was a matter of some concern to him that the divergence should have become so wide.

He wished to emphasise the fact that to the average pilot there was no relation between the free air in which he flew and the "standard" air of the technician's convention. If the technician could make God' free air into standard air he would have gone as far to make flying safe as the meteorologist would if the latter could control the weather instead of only forecasting it. Because the mathematical air has (of necessity) reached stability, the technician is prone to consider himself, as a person, superior to the pilot who cannot order his air to behave quite as he would wish it to do.

The next part of the paper concerned itself with six slides illustrating the performance of an imaginary composite aeroplane. Captain MacMillan emphasised the fact that flight is four-dimensional (height, length, width and time), and that as a result the full capabilities of flight could not be illustrated graphically. The best that could be done was to depict the various aspects of flight by separate diagrams and then piece these together mentally.

By way of demonstrating the poor climbing capabilities of aircraft, the peculiar speed-climb diagram shown by the lecturer is interesting. Such a diagram consists of slices of a sphere with the larger diameter as max. speed in m.p.h. at sea-level and the smaller diameter as corrected speed at service ceiling. The distance between the two is climb in m.p.h. This diagram at once emphasises the fact that a machine's rate of vertical ascent is about 1/40 of its speed at sea-level. Mr. MacMillan suggested that a sea-level climb of 5,280 ft. (60 m.p.h.) would be a good goal for which designers should strive. [This suggests that two new terms are needed, namely "Rising speed" instead of "climbing speed," and "sinking speed"—or "rate of sinkage"—each being measures of vertical speeds, irrespective of air-speeds or angles of ascent or descent. The phase "climbing speed" should by rights indicate the air speed of a machine when climbing, and "best climbing speed" should indicate the proper air speed for the "best rising speed."—C. G. G.]

The next figures illustrate the difference in performance of the same machine as viewed by the technician and pilot. These two diagrams show the speed range plotted against height, one as the pilot reads from his instruments and the other as corrected for standard air. The difference is striking and one can quite understand Mr. MacMillan's wish to see the figures from the Air Speed Indicator (A.S.I.) in parentheses beside the performance figures.

The remainder of the paper is devoted to the three sections of flying, take-off, fully air-borne flight and the alighting.

If the average flight be taken as one of 30 minutes and the average time of take-off and alighting is 15 secs. each, then a pilot with a flying time of 100 hours has only about 4 hours of take-off and alighting experience to his credit even allowing for the additional time devoted to this subject in the preliminary stages. This accounts for the number of accidents near the ground to pilots comparatively young in experience.

The art of flying lies in the judgment of eye, the touch of hands and feet, and the synchronisation of all to one end. The vacillating individual should not fly if he values his life, unless he has first conquered this failing.

The horizon, which plays an important part in the pupil's lessons, is an excellent datum line about which the instructor can display the functions and values of controls when on the turn, and from which he can direct the aeroplane's attitude to the horizontal when on a glide, but it should not be carried too far into the pupil's

For COMMERCIAL FLYING

ARMSTRONG WHITWORTH ARGOSIES

FOR commercial flying the Armstrong Whitworth Argosy fitted with Armstrong Siddeley engines is the best proved and best paying aircraft in the world. Argosy air liners have now been in use by Imperial Airways Limited for over three years and have won an unsurpassed record for reliability, safety and low cost of upkeep.

Argosy Aircraft are fitted with three 460-510 h.p. Armstrong Siddeley Geared Jaguar engines. The normal useful load inclusive of fuel for 3½ hours is 5,000 lbs. or 20 passengers, luggage and a crew of two.

The recommended cruising speed is 95 m.p.h. at which speed the petrol consumption is 65 gallons an hour. The top speed is 120 m.p h. The tanks have a capacity of 360 gallons, which gives a maximum endurance of 5½ hours. The aeroplane takes off with full load in 200 yards and will fly easily on any two engines at a height of 2,000 feet.

SIR W. G. ARMSTRONG WHITWORTH AIRCRAFT LIMITED

Works & Aerodrome: Whitley, Coventry. London: 10 Old Bond Street, W.1

Digitized by Google

post-training flying. The horizonless aspect of flight is very important, because the glide to the landing on strange aerodromes may bring the nose of the aeroplane below a false horizon and throw the inexperienced pilot's judgment out.

Again, modern streamlines and wing sections have so diminished head-resistance and have so increased lift that sometimes the nose of the aeroplane actually rises above the horizon when in a slow glide, and if the pupil sticks to the principle of so much nose below the horizon the landing will be made too quickly.

Under the heading of take-off Mr. MacMillan gave the routine which should invariably be followed, such as noting the direction of the wind, and the position of obstructions, the position of any aircraft in the neighbourhood and the correct functioning of the controls. If the machine is new to the pilot, he should note the attitude on the ground so that he may have some idea of what the stick movement to raise the tail will be and also that he may know the exact position for a three-point landing.

The characteristics of aeroplanes vary in the take-off, but to a less degree than in the alighting. The main factors that can affect the take-off are changes of load, alteration in position of the centre of gravity, airscrew characteristics, tail-skid load, tailplane and elevator surfaces, wheel resistance, head resistance, and wing section.

Fully air-borne flight is much easier than the driving of a motor-car. Horizontal variations of atmospheric pressure affect the reading of the altimeter. One millibar is equal to 30 feet and a deep depression could cause an error of 1,000 feet in the reading of the altimeter, that was, the pilot would be flying 1,000 ft. below the indicated height.

The worst predicament in which a pilot can find himself during fully air-borne flight is a spin and the worst variety is that of the inverted spin with all the accelerations tending to heave the pilot into space.

Just as every motor-car is better when fitted with four-wheel brakes so is every aeroplane better when fitted with slots. The slot does not eliminate the spin, but makes it almost impossible to spin involuntarily, for all three controls must be applied to the maximum to produce the spin when the aeroplane is in a stalled condition.

Mr. MacMillan stated that he did not know the effect of the slot in an inverted spin. Every pilot should know how to spin and how to recover from both the inverted and normal spin so that in emergency he could act without hesitation.

Alighting should be divided into two parts, the approach and the actual alighting. Approach varies with every aerodrome and every wind. Generally speaking, overshooting is better than undershooting.

Alighting is a simple matter if the approach has been properly made, though if the approach be made too slowly, the aeroplane may tend to glide into the ground.

Landing is always done best by looking well ahead of the aeroplane. Looking close upsets the time-factor and makes landing more difficult to do consistently.

The final portion of the paper dealt with the flying of seaplanes. The term aeroplane had been used throughout the rest of the paper as what had been said applied equally to land and sea machines.

Any pilot who can fly an aeroplane can fly a seaplane in the air. The seaplane is more clumsy, the speed range is usually less and its manœuvrability somewhat poorer. [Barring Schneider Trophy Entries?—Ed.] The real difference between the types lies in the handling on the water. Experience of yachts and motor-boats helps.

The seaplane is at a disadvantage on the water as it has no keel and is therefore subject to drift and list. The low-wing monoplane is the best machine for handling on the water. [Yet with the exception of the Short Mussel, and there is only one of it, there is not a single craft of this kind, barring racers, in the country to-day.—Ed.]

The take-off of a seaplane is quite different from that of a land-plane. The nose of the seaplane must be held well up when the throttle is first opened so that the water breaks as far aft as possible. Between 15 and 20 knots the seaplane passes from the partly displacement-supported condition to that of hydro-planing. At this point there is frequently a change of stick-position and if the thrust horsepower be low, the crossing of the "hump" needs great skill.

Acceleration is rapid when once hydro-planing begins, though towards the end of the run resistance builds up again and the available thrust becomes important. The pilot can do a great deal to help take-off by forcing the floats to adopt the angle of minimum resistance.

In rough weather the skilled seaplane pilot carefully watches the run of the sea and chooses the moment to open his throttle. It pays in rough water to get the seaplane into the air with minimum run but the machine must not be thrown clear of the water before it has reached flying speed, as it will fall back, stalled, into the trough of a sea and suffer serious damage.

On smooth water there is no difference between the alighting of a seaplane and a land machine, except that it is more difficult to judge height over water than over land. In rough weather the seaplane has to be landed on a surface that would appal the average land-plane pilot. The seaplane has to come down with a minimum forward speed and touch ever so slowly on the crest of a wave. Misjudgment may cause the seaplane to fall into the trough where it will be swept by the next wave. Alighting too early sends the seaplane high into the air to fall heavily in a stalled condition in the turmoil of the sea.

THE DISCUSSION.

COL. THE MASTER OF SEMPILL, Chairman of the Royal Aeronautical Society, said that this was the first lecture in the 65 years' existence of the Society on The Art of Flying. He referred to Mr. MacMillan's experiences in the Bay of Bengal when he was adrift on a seaplane for six days, and for the last 52 hours of those six days was clinging to the floats.

He hoped to hear something of the Art of Flying from the lighter-than-air pilots and auto-giro pilots. He referred to the fact that long enough experience as a pilot was a qualification for membership of the Society. Col. Sempill also mentioned the references to the Art of Flying in Dr. Johnson's "Raselas" of 1750. Finally he called upon Lt.-Col. Moore-Brabazon, who is, officially, the first British subject to fly over British soil, to open the discussion. This flight of Col. Moore-Brabazon's was made on May 2, 1909.

COL. MOORE-BRABAZON said that twenty years separated his experiences of flying from those of the present day and though in his second childhood he proposed to take to a Moth instead of an armchair, he did not feel that he could say anything of value about the Art of Flying. He thought that the lecturer had fought the battle of the practical aviator very efficiently and that in Mr. MacMillan could be seen the happy marriage of science and practice.

FLG. OFF. R. L. ATCHERLEY said that he had nothing to contribute. [Which recalls Wilbur Wright's remark that the parrot is the bird that talks most and flies least.—Ed.]

SQ. LDR. RAE said that this was the first lecture that he had attended and he thought it would be a good thing if the designer did take advice from the pilot.

AIR COMMODORE WEIR thought that the great snag in flying was the amount of technique required by the pilot. He mentioned that he had just returned from the United States and said that over there the majority of the machines were high-wing monoplanes with high wing-loadings which required to be landed fast and this entailed a number of accidents. In reply to questions from the Chairman referring to the Guggenheim Safety Competition, he said that there were some 23 entries and at the time of his visit to the field there were only two machines there, the Brunner-Winkle, which had already failed, and the Handley Page. Mr. Harry Guggenheim, in conversation, said that he thought that a total of 8 or 12 would materialise out of the original entry.

FLT. LT. JENKINS, who thought that there should be more technician-pilots, said that technicians could more easily be pilots than pilots technicians. He thought that aerobatics were very important and regretted that so little had been said about this subject in the paper. Did Mr. MacMillan mean that Service pilots should have more technical training? He referred to the importance of adjusting the tailplane for landing as well as take-off. He quoted a case to stress the danger of false horizon and disputed the lecturer's remarks about the behaviour of the high-lift wing when landing.

FLT. LT. J. S. CHICK did not agree that it was a good thing to fly without a horizon and thought that it was a bad thing to fly without instruments.

FLT. LT. BROWN, who had written a paper on deck-landing and had been told that it contained too many technical terms, said he thought the question of how far to look ahead was very important for deck-landing. He also thought that one should not fly by instruments and that pilots should be more technical.

SQ. LDR. ENGLAND said that they shortly hoped to have information on the effect of slots in an inverted spin.

SQ. LDR. PROBYN said one could easily learn to fly in 6 hours from any given aerodrome but that the fun started when the beginner tried to land elsewhere. He wanted to know what happened when you were flying into the wind and suddenly passed in the lee of some building, did you accelerate?

MR. MACMILLAN, replying, said that the inertia of the machine would prevent its sudden acceleration. He mentioned two experiences of his own. One, a queer patch in the sky at 16,000 feet which he had been unable to penetrate though the machine he was flying had a service ceiling of 19,000 feet; the other was a cyclone in the Persian Gulf when by flying along the top of a cliff he had been able to add 30 m.p.h. to his speed.

He regretted the divergence of outlook between the pilot and technician but all the same he knew the designer should design the machine. He agreed that flying required too much technique. He hoped to see an increase in the number of flying technicians. He thought that the average flying school did not teach enough theory, though the pilots were anxious to know more. With regard to what could be done by flying blind, he quoted the successful experiments and achievements of Lt. Doolittle, U.S.A., who had recently succeeded in taking off, flying to-and-fro, and landing, solely by instruments in a hooded cockpit.

A TRIP TO SPAIN.

On Oct. 23 the *Graf Zeppelin* left Friedrichshafen for Spain with the Spanish Ambassador in Berlin, Señor Espinosa de los Monteros, on board.

Later in the day the airship flew over the city and the International Exhibition grounds for more than an hour.

The *Graf Zeppelin* arrived back at its base on Oct. 24 after a cruise of 31 hours.

There is no doubt that the quiet way this airship goes off on these trips is influencing public opinion very considerably.

CIVIL AIR ACCIDENTS IN FRANCE.

The Times Paris correspondent states that the French Air Ministry have now published an account of three serious accidents which occurred in August and September last. This is the result of the promise of M. Laurent Eynac on his appointment as Air Minister that prompt inquiries should be held into the causes of air accidents and that wherever possible the results would be published.

As a result of the inquiries on which these reports are based, flying in one type of machine has been stopped until the structure of this type has been specially tested.

The movements of aircraft on the ground at aerodromes are to be controlled by a system of signals. A competition for apparatus giving audible warning of the loss of flying speed is also being arranged.

With regard to the last item THE AEROPLANE of May 29, 1929, had a descriptive article on a syren device produced by Mr. Wynn, which would appear to meet the case,—and there are always the Bramson anti-stall gear and the Handley Page slots for those who want to fly with less risk.

THE AIR-PARK SUPPLEMENT

THE SELECTION OF A MUNICIPAL AERODROME.

BY SIR ALAN J. COBHAM, K.B.E., A.F.C.

During my recent tour of the British Isles, when I visited some hundred centres, I have been amazed to find how little the average man-in-the-street knows about flying. It has been my lot to address some four or five score meetings of city and town councils and civic authorities and on all occasions I have found it necessary to explain the simple fact that an aircraft takes off and lands head into wind.

In endeavouring to show them how urgent is the national necessity for an aerodrome for every town and village throughout the British Isles, I have discovered that the average civic official has not the faintest conception of the facilities aircraft require.

After many a successful meeting, I have been approached by enthusiastic converts to the cause of flying who tell me they have the very site on their farm or near their garden, and after some questioning I find that this potential municipal airport is anything from 5 to 15 acres in extent.

When I tried to explain to one gentleman that 15 acres was not enough, he argued that aeroplanes could land on the decks of ships which are not even half an acre in extent, therefore surely 15 acres would be more than enough. Of course, on the face of it, this needs a little explaining away to the ordinary layman, in view of the fact that I have advocated aerodromes of 100-150 acres.

Another great trouble I invariably meet is the local flying expert. I am approached by the Borough Surveyor and the Town Clerk, who inform me that they have a very fine site in mind. They are sure that it is quite satisfactory, because Mr. Jones says so.

I politely enquire who Mr. Jones is. "Oh, don't you know Mr. Jones?" they say. "Oh, he is a great flying man round here. He bought a Moth last week, you know, and he says the ground is very good."

Mr. Jones, it transpires, has done about five hours' solo and has just become a private owner. Therefore, he immediately becomes a technical aerodrome consultant, of course. In such cases, I have only to explain that if Mr. Brown buys an Austin Seven, he does not automatically become a road engineer, and they see it. This simile has been very effective in counteracting the activities of the local aviation expert.

Although I have not been flying as long as a good many people, but only, shall we say, 11 years, continually, day in, day out, throughout the year, I have never come into such close contact with atmospheric conditions in relation to the lift of a machine, and the horse-power needed for get-off and flying, as I have in my tour of the British Isles this Summer.

I have been flying, on an average, 5½ hours a day every day since the beginning of May and in practically every case I have discovered that the worst period in the day for flying, from a performance point of view, has been in the morning or the early afternoon. As the day progresses, the lift of the machine improves and by the evening, especially during the Summer months, I have been cruising about in the air on 100 revs. less than I required in the early part of the day.

Again, there have been the trying conditions of heat. There have been days when the air has been good to rise on, others when it has been quite "dead." In fact, I have come to the conclusion that for the demonstration and testing of aircraft, from the point of view of getting excellent figures for publicity, the most essential thing to do (assuming you have a good aerodrome, especially from the approaches point of view) is to choose the right type and the right time of day. The local climatic conditions are a very important factor indeed in the selection of a future municipal aerodrome site.

As an instance, the officials of one town were very keen and they had already selected the site they wanted ex-

THE START OF THE CAMPAIGN.—Sir Alan Cobham and Sir Charles Wakefield at Stag Lane, with Lady Cobham and son,—and Air Vice-Marshal Sir Sefton Brancker (on the extreme right),—with the De Havilland Giant-Moth (Jaguar engine), "The Youth of Britain," behind.

Digitized by Google

tended and developed for a municipal airport. However, on the day I arrived a west wind happened to be blowing, and on consulting the local wind-chart, I found that the percentage of west winds was quite high.

Away to the south of the proposed site was a low hill with a bank of trees on top. This could not be easily avoided in a southerly take-off. In practice I discovered that it was almost impossible to get out of the down-currents. In fact the take-off was a most terrifying procedure. All one's climb was destroyed by the down-current. I am convinced that many fatal accidents in the past have been caused through no fault of the pilot other than that he had never considered the possibility of down-currents totally destroying his climb and stalling his machine.

An aerodrome site might be selected with one of these conditions, and, although it might be used for 12 months or years, and although all the experts might test it out, on one day the wind might come in this particular direction and these particular atmospheric conditions prevail, and some poor individual, who had every faith in the experts' selection of the site, might take-off, possibly with a slightly overloaded machine, and the down-currents would overcome him.

It will therefore be seen that a most careful study must be made of every possible approach, and every possible take-off, round an aerodrome, and every possible local climatic condition in relation to these.

I have always made a very keen study of the down-current question and when summing up my experiences of various currents over Europe, I always advise folk to avoid the down-currents on the leeward side of a hill or mountain. To my mind, there have been many more unsolved accidents caused by violent down-currents taking a machine out of control than is usually recognised.

In the selection of an aerodrome site for a town many points have to be considered. First of all there are the local weather conditions in relation to fog, low cloud, and smoke-drift. These should all be considered separately.

In hundreds of cases I have found that the lay mind does not realise the difference between ground-fog and low cloud. Invariably the man who lives on a hill which is subject to low cloud thinks it is ground fog, and many who live on low-lying ground liable to ground fog are convinced that the clouds come down on top of the ground. Again, although there may not actually be cloud on top of some high ground, very often it is hanging about only 50 ft. above the surface.

From my own experience of flying in the British Isles, I am quite convinced that the one condition that stops flying more than any other is low cloud coming right onto the ground. Ground fog is invariably of a very temporary nature. It may be bad in the morning but it usually clears up in the day very quickly. I have often heard folk say that on the hills they are bathed in sunshine while down in the valley everything is buried in fog. This may have been early in the morning for a brief period and it is only a few days in the year that this happens whereas the hill-tops are very often buried in low cloud.

CONSULTATION.—The Mayor of Colchester (Councillor John Russell) discussing an aerodrome site with Sir Alan Cobham.

I mention these points because in the majority of cases it is better to choose the low-level site for an aerodrome than the high-level one, unless, of course, owing to local conditions, it is extremely liable to ground fog. The best way to get about the British Isles by air in bad weather is to hug the valleys and the lower contours.

I can remember in 1922, when we ran a bi-weekly service from Stag Lane to Manchester, we always tried to go on a straight compass course which took us over the south-west corner of the Peak district. We found that only on ten per cent. of our trips were we able to keep to that course for the entire distance. Although we might go straight over

FEMININE INFLUENCE.—The Lord Mayor of Portsmouth and his daughter,—after an aerial survey of their city with Sir Alan Cobham.

the Chilterns into the Midlands, beyond we always ran into cloud banks and had to fly due west, come out over the Potteries and Stafford and then creep up the L.N.W. Railway over Crewe to Manchester.

I have discovered during my tour of the British Isles that one really needs a big machine of the air-liner type to get the right perception of what is required for an aerodrome. I tested out on a Moth all my landing grounds before actually beginning the tour, and even so I made blunders regarding the possibilities or otherwise of landing grounds for my air-liner.

One needs a heavily-loaded machine to test out the qualities of an aerodrome, and once or twice or three times is not enough to fly round and test out the approaches and general conditions. Very often, after flying round the district for twenty times, I have found a new possible aerodrome site which for some reason I had hitherto missed.

The responsibilities of selecting an aerodrome site cannot be over-rated, because apart from the initial liability incurred for purchase, clearing and development, there is that responsibility which is attached to its future development. One might select a site quite suitable for use for the next five years, after which it might be discovered that owing to certain town-planning schemes having gone ahead, certain approaches had been irrevocably destroyed, or extension needed for the increase of air traffic was impossible on account of new developments on the boundaries.

One must not look five years ahead, or 10 years ahead, but 50 years ahead. The whole thing to remember is that it is not only the initial outlay that matters, but once a site is purchased money is continually going to be spent on it, there will be all kinds of improvements and developments, until eventually there is a very large sum of money invested in the aerodrome. Then the time will come when it will be impossible to consider altering the site on account of the tremendous sums of money involved.

Therefore, imagine the disaster that would come about if a site had been chosen wrongly and all the time another and better site existed and could have been selected had the job been done properly.

Other details that must be borne in mind when selecting the best site are whether promising sites are liable to floods in winter, or to subsidence (such as in mining areas); whether they can be drained easily, whether the soil is very light, causing continual dust, etc.

Gradients should be most carefully avoided, firstly because an uphill take-off is very bad for a heavily-loaded machine, in view of the fact that not only must the machine run uphill, but there are almost certain to be down-currents; secondly, because a machine landing down-hill could not pull up, as our present aircraft are not fitted with wheel brakes.

It is essential, in the selection of a municipal airport, to secure an option on all surrounding property, otherwise the approaches can be utterly destroyed and the whole aerodrome ruined by the erection of obstructions round the boundaries, such as high-tension cables, tall buildings, factory chimneys, wireless masts, etc. That is why a municipality must contemplate an aerodrome 150 acres in extent, or even larger still, so that aircraft can take-off, turn and operate entirely in its own area. Or at least, a municipality must contemplate purchasing areas round the aerodrome to protect the boundaries. Municipalities do not seem to realise that flying space is as much a part of the aerodrome as wheel space, and is just as important.

The ordinary layman would very often not even see a good aerodrome site from the air. He only visualises an open space, and hedges, ditches, trees, a roadway, immediately destroy the open space in his imagination. The expert sees through all these and visualises the area when hedges have been removed, ditches filled in, trees cut down, roadways diverted, slightly marshy areas drained, small undulations levelled, small buildings or huts razed. It is only by looking at the question in this light that good aerodromes can be found close to towns.

The opinion seems to be very widely held that an aerodrome must be near a railway station. Why this should be I have never been able to fathom. I cannot think what good the railway station is going to do. All passengers and goods could easily be brought to the aerodrome by road transport. In any case, a railway embankment bordered by telegraph wires is a very bad boundary for an aerodrome. Before anything else, the main essential is to find a good site, regardless of all else. It will then be well worth while to construct a special road to the aerodrome.

The municipal aerodrome question must be attended to immediately, it is an urgent and vital national necessity. Apart from this, a municipality will be able to purchase an aerodrome site to-day at a very reasonable figure, whereas in 10 years' time, when every town without an aerodrome will be definitely out of the running, they will have to pay fifteen or twenty times as much as they would pay now.

MUNICIPAL PROGRESS IN BELFAST.

The General Purposes Committee of the Belfast Corporation are to recommend the City Council to seek powers to contribute a sum not exceeding £200 a year for 15 years towards the rent of land owned by the Harbour Board which is to be developed as an aerial base by National Flying Services, Limited.

AIR-PARK PLANNING & CONSTRUCTION.

By Nigel Norman.

In the following notes no account will be taken of the choice of aerodrome sites, nor will it be possible to enter into such details of the plan as are usually governed by local conditions, which differ considerably in every instance. In the preparation of an aerodrome much will depend upon the nature of the soil. If this be naturally quick drying and of a sandy, gravelly or chalky nature, the expense of building the aerodrome will be much less than if clay or heavy loam is to be dealt with.

The site should first be roughly surveyed from a convenient datum. In order to provide a surface suitable for all types of aircraft, the scheme of levelling should be arranged to allow no slopes with a gradient steeper than 1 in 60. Steeper gradients exist on many well-known aerodromes and the majority of aircraft can negotiate slopes up to 1 in 40, but such slopes have a noticeable effect which may be serious in the case of fast-landing machines.

The method of levelling will depend upon the amount of work to be done, but it is safe to say that it will almost always pay to employ mechanical implements. A great deal of work can be accomplished by plough, cultivator, and "ground-hog" or scraper operated by a standard Fordson tractor. In some cases, it may be necessary to employ the much more powerful types of "grader" such as are used for colonial work.

Whatever method is employed, it is of the utmost importance that the top-soil be removed in the early stages of levelling and set aside, to be spread again to a depth of at least 4 inches in the final operation. The texture and wearing quality of the surface will be seriously affected if this precaution be omitted.

Climate is a most important factor in aerodrome construction. In England we are fortunate in being able to grow without difficulty a carpet of thick grass which will last the year round and this fact will no doubt save us for many years from the necessity for building expensive concrete run-days.

In America these are appearing on many fields. On others of a particularly dusty nature the rather messy expedient of kneading several applications of asphaltic oil into the soil has been tried successfully. But there is no doubt that had it been possible to grow English turf, these costly measures would have been much less frequently used.

On the other hand, this grass-growing climate is apt to give us long spells of wet weather, as well as sudden downpours of water, and for this reason the drainage of an English aerodrome must be perfect. In soils other than chalk or sand a system of land-drains will be necessary, varying with local conditions. In this connection, slopes of the order before-mentioned are very helpful.

Before deciding upon the drainage lay-out as much information as possible should be obtained from local farmers. But it is well to remember that agricultural drainage is not likely to suffice on a heavily used aerodrome. Flying drains must be better than farming drains.

A skeleton of main drains will probably be needed. These may well be open-jointed pot drains set in clinker and not less than 3 ft. below the surface. In heavy soils the method known as "mole-draining" may be used with great advantage to lead water to the main drains. Alternatively narrow trenches filled with clinker, or 2 inch field-drains may be used. In draining it may be cheaper to be extravagant in the early stages than to skimp the work and later continue draining operations after flying has begun.

Where an aerodrome is to be sown, Autumn sowing is preferable to Spring. The former allows the growth of a good root-mat before Summer flying starts. Parsimony in seeding is the falsest economy, for a mistaken policy at this stage may lead to unsatisfactory results and heavy outlay for years to come.

Certain seed firms, notably James Hunter Ltd. of Chester, have specialised for many years in aerodrome construction and seeding, and are always ready to come forward with expert advice and assistance as to method of treatment, manuring, and choice of grass-seed mixture.

Clover should be included in the mixture, because once established, it improves the appearance and wearing qualities of the turf, stands up well to periods of drought and increases the value of the grazing considerably.

The variety of grass seeds available and their importance for different purposes is not generally appreciated. As an example, therefore, it may be of interest to quote in full two specifications recently drawn up. The first was designed to produce a close-growing hard-wearing turf, calling for the minimum of cutting. The second and more elaborate mixture was specified with two purposes in view, namely to provide a good hard-wearing sole of grass and at the same time offer rich grazing for cattle or sheep during the greater part of the year.

Aerodrome Seed Specification "A."

40 lbs.	Dwarf Perennial Ryegrass.
20 lbs.	Sheeps' Fescue.
10 lbs.	Wavy Mountain Hair Grass (especially for highly elevated sites).
8 lbs.	Smooth-stalked Meadow Grass.
2 lbs.	Wild White Clover (Genuine Old Pasture).
80 *lbs. per statute acre.*	

Aerodrome Seed Specification "B."

2 lbs.	Tall Oat Grass.
14 lbs.	Cocksfoot.
1½ lbs.	Sheeps' Fescue.
1 lbs.	Tall Fescue (Genuine Rhenish).
8 lbs.	Italian Ryegrass.
28 lbs.	Perennial Ryegrass.
1 lbs.	Rough stalked Meadow Grass.
½ lbs.	Birdsfoot Trefoil (Indigenous).
1 lbs.	Trefoil.
1 lbs.	Kidney Vetch.
11 lbs.	Timothy.
2 lbs.	Alsike Clover.
4 lbs.	English Broad Red Clover.
2½ lbs.	Late-flowering Red Clover.
1 lbs.	White Dutch Clover..
1½ lbs.	Wild White Clover (Genuine Old Pasture).
80 *lbs. per statute acre.*	

PRIMÆVAL CHAOS.—The Conspirators at Work. Messrs. Muntz (left) and Norman (right) beginning the laying-out of the Heston Air-Park.

Digitized by Google

The seedings are calculated at the rate of 80 lbs. per statute acre. Half this quantity of seeds will serve, however, if time is not the essence of the contract.

Where a large aerodrome, on which sheep are permissible, is to be sown it might be worth while to use mixture "A" on the 50 acres usually used for landing and taxying, and mixture "B" on the distant or marginal areas. This would have the effect of attracting stock to the outer grazing, which would be more palatable than the harder wiry grasses on the landing space.

The layman in any case should remember that a good result is not obtained by just "sowing grass." What he plants will always be with him and he should approach the selection of his seeding in the same attitude of mind as if he were choosing trees for an orchard.

Aerodrome Town-Planning.

In the lay-out of the buildings the town-plan of the area is usually a controlling factor. From this, present and future approaches can be decided and the ultimate distribution of activities around the landing area arrived at. A space convenient of access and commanding a pleasant prospect may be set aside for social development in connection with club, restaurant or hotel. Near this will be the private owners' garages and service station. This area should if possible be to the south of the aerodrome, so that spectators may be able to watch the flying undazzled by the southern sky.

For the same reason, the control station may also conveniently be on this side of the aerodrome. Where the aerodrome is to be generally used, as in the case of municipally owned aerodromes, areas should also be set aside for the accommodation of commercial air-transport undertakings, for the use of manufacturers and for the more extensive repair facilities and air-docks which will one day be needed.

Between these areas, lanes of unobstructed approach should be allowed for, forming flight-ways into and out of the aerodrome. These flight-ways will ultimately control the position of the run-ways when the time comes for their construction.

In the first development it may be unnecessary to bring into use the whole of the acreage ultimately available as landing area, and the plan of the aerodrome may with advantage be designed to take in successive areas as activity increases.

In the arrangement of the buildings themselves the objects to be sought are ease of operation and compactness. A well-thought-out lay-out may save hundreds a year in wages by bringing work into quick relation with staff; and at the same time the resulting convenience to customers will attract increased business.

Compactness is also essential, for the financial value of an aerodrome is ultimately the value of its perimeter, and the more economically this is disposed the more space is available for development without encroaching on the landing area or ringing the ground with obstructions.

Generally speaking, 'planes should drink near where owners drink; repairs should be made where faults are found; housing should be close to arriving.

It has already been suggested that the buildings designed for social activities should be sited if possible to face the northern sky. Probably a direction just west of north is the ideal, allowing them to catch the last western glow of summer evenings.

In many aerodromes the error has been made of placing these buildings in the same line as the hangars. It is preferable to set them well forward of this line so that spectators may feel themselves close to the flying and not hemmed back by a screen of stationary machines and an army of mechanics.

Architecture.

A definite style of architecture appears already to be growing up for aerodrome buildings, affording flat roof-terraces, observation towers and full-length windows. It is time that such work engaged the attention of our greatest architects, for no foreground sets off a building better than the green plain of an aerodrome, and the construction of a new air port or park offers great scope for a fine conception.

Essential features such as control tower, wireless masts, fuel points, oil stores, compass base and "tarmac" should all be brought into the scheme as well as hangars, workshops and other buildings. Where the ground is clear there is no excuse for haphazard arrangement.

The design of the commercial buildings and hangars will depend much upon the class of traffic to be handled. Where large buildings of a permanent nature are concerned, reinforced concrete construction will have many advantages. The buildings themselves will be not so much hangars as composite structures containing offices, workshops and passenger accommodation, as well as housing space for aircraft.

At the present moment, a design is being considered by a certain firm for a building of this nature which in one block shall comprise all the buildings required as the nucleus of an air-park or municipal air port. To provide hangar-space, lock-ups, service workshops, aircraft showrooms, offices, control rooms and a certain amount of hotel accommodation, the plan must necessarily be somewhat elaborate, but it is thought that the advantages of compactness, concentration of the necessary services and elasticity of design for future expansion will more than justify the complication of the design.

Such a building would certainly be an imposing erection, would attract the public from the first, and would no doubt rapidly become a centre of entertainment and commercial activity.

It is unlikely that huge hangars capable of holding the largest commercial craft will be required at other than manufacturers' aerodromes. For large machines, moorings will be provided where they can ride securely, as it were, at anchor. Only for periodical overhaul will they be flown to air docks where complete cover is available.

Where such hangars are being constructed abroad, however, the virtues of reinforced concrete have been appreciated. In one instance, a shed of 180 feet clear span has been made entirely of concrete, the thickness at the highest point in the roof of parabolic design being less than three inches.

CHESTER.

Digitized by Google

For small hangars, and buildings of a more temporary nature, steel frame construction with a covering of asbestos sheets, Robertson protected metal, or galvanised iron, is probably best. Already certain designs of sheds suitable for small and medium-sized aircraft are becoming standardised. That adopted by National Flying Services is a particularly convenient and at the same time inexpensive type.

The more or less uniform size of modern light aircraft has led to the construction at Heston of a special form of hangar which has proved very successful in use. This comprises 20 separate lockup garages, each with a sliding door, arranged in two rows, with a covered area between in which machines can be unfolded or worked upon under cover. This central space can be used as emergency housing room and will take machines up to 40 ft. span.

The latest form of this hangar contains 14 light 'plane lock-ups and two lock-ups 40 ft. by 30 ft. suitable for use as workshops or for larger non-folding private machines. Such a building might well prove suitable as the first to be constructed on a provincial or club aerodrome, where accommodation for large aircraft is not required immediately.

In all hangars the door design is of great importance. Doors easily movable by one man and giving the full clear opening are a great advantage and will soon repay their extra cost over that of a cheaper and less convenient type. The design manufactured by The Educational Supply Association Limited (Esavian) may be quoted as particularly convenient in use.

Aprons.

In all aerodrome layouts, the character of the whole place will be much more affected by the nature of the apron or tarmac. *An extensive apron is the first labour-saving device to be added to a landing field,* and during a large part of the year the convenience and comfort of those using it will depend greatly upon its area and surface.

Various materials are available. At Royal Air Force aerodromes asphalt tarmac is chiefly used and has proved satisfactory. At Croydon, an expensive pavement of Victoria Stone has been adopted. This is said to have a low coefficient of friction, so that machines are inclined to slide very easily over it, which is not entirely an advantage.

On many of the finest aerodromes abroad concrete has been used and this appears very satisfactory in use. The concrete aprons recently laid down at Heston Air-Park have been constructed by a special process of casting *in situ* in 5 ft. squares, which makes the cost of construction less than that of ordinary tarmac.

These squares are separated from each other by small interstices, which provide room for expansion caused by temperature, and also allow for some movement caused by sinking, before further cracks develop. In case of fracture of any squares, it is a cheap and simple matter to break them out and cast in new ones. So far this apron has proved entirely satisfactory, but final judgment cannot be passed upon it until it has seen a winter's heavy use.

Fuelling Plant.

The method of fuelling to be adopted is an important point to be considered in connection with the layout of large aerodromes. Bulk storage for several grades of fuel will be required, and fuelling points must be arranged conveniently to supply the small quantities required by light aircraft or the larger demands of big commercial machines.

In laying out the fuel system it is well to arrange for the storage tanks to be some distance from the fuel points, and adjacent to a good road where fuel lorries can drive up without obstructing flying and service operations.

For light planes the overhead swing-arm has proved the most satisfactory fitting. Several swing-arms may be grouped together at one point and this is advisable where customers may have preference for one grade of petrol or another.

For larger machines experience here and abroad has shown that a fuel point in the aerodrome itself, with concealed hose-drums giving a radius of 50 feet or more, is a suitable arrangement.

In Germany, a special type of fuel lorry fitted with pump delivery is being tried and offers a convenient alternative.

Where the through-put of fuel is likely to be at all large the extra cost of a pressure system is justified. A type of meter is available capable of measuring with commercial accuracy the flow of petrol, and this makes possible a one-man system such as that recently installed at Heston on the Bywater system. Here pressure is maintained automatically by water-head.

It is only necessary to set the meters to the amount required to be delivered, place the hose nozzle in the tank and pull the trigger. A rate of flow up to 40 gallons a minute is available and the system can live up to the standard set for it, that is, "one man, one 'plane, one minute."

In the foregoing notes, an effort has been made to stress the practical side of aerodrome-planning, and the romantic aspect of this subject has perforce been suppressed, although this is really its most attractive feature. One day it will be as exact and steorotyped a science as bridge-building. But to-day, to those whom it interests, it is a fascinating game.

At any moment our air traffic problems will be upon us. We must prepare for 300 m.p.h. commercial torpedoes, and whirling air-anemones that can ascend and descend like flue brushes. We must take off mechanically, and land electrically, in daylight, dark or fog. Our wide air-parks may give way to wind-screened air harbours perched on railway-station roofs. But the present is thrilling enough. Our enthusiasm is not damped by visions of the poster-plastered platforms and crowded compartments of Europe's future Overground.

AN AIR-PARK IN BEING.—Heston,—Left to Right, the corrugated-iron lock-ups, the ferro-concrete main hangar, and the Social Focus. The main Bath Road is just out of sight in the background.

LAYING OUT AN AERODROME.

BY A. C. A. JACKAMAN.

In discussing the subject of the design of hangars and the lay-out of the surrounding aerodrome buildings, it should be remembered that the civil aerodrome of the future, while affording the accommodation of a terminal station, must be properly equipped with work-shops, offices, petrol supplies and other essentials. Also, it is imperative that it should form a social centre for the private owners of the surrounding district, and in each case should be to aviation what Brooklands is to motoring.

One of the most unpleasant experiences in civilian flying, by which is meant travelling by air from place to place on either business or pleasure, is to arrive at an aerodrome which is devoid of the ordinary comforts of a village inn. A glaring instance of this kind is Lympne Aerodrome, where many an owner-pilot lands to declare Customs, but is unable to obtain refreshment after what may have been in winter-time a cold, tiring and lengthy trip from the Continent.

As aerodromes in the future will be used by the general public when travelling either by the regular air-liners or in their own private machines, they must necessarily provide

(a) Ample accommodation for machines of all sizes and classes.

(b) A club house or hotel where the traveller can obtain refreshments, both hot and cold, and also be able to while away any waiting time in comfortable lounges and waiting rooms of attractive design, from which a good view of the aerodrome itself can be obtained.

(c) The usual petrol, oil and repair services.

The average aerodrome at present in existence in this country consists, largely on account of the War 1914-18, of half-a-dozen or so very ugly hangars, the main openings of which are usually closed by doors of such inefficient design that it takes a squad of men to open or close them when required. In addition to this, these doors are generally such a poor fit that even when they are closed they do not afford effective protection from the weather. They give one the feeling at the end of a long day's flying that although inside the supposed shelter of the hangar, one is still so cold, wet and miserable, that one never wants to see an aerodrome again. This is not the way to encourage the British Public to fly, or to regard flying as a perfectly ordinary means of getting about the country with very much greater speed and in greater comfort than any motor car or train can offer them at the present moment.

There exists at present a growing tendency to erect steel-framed hangars covered with corrugated iron which, in addition to their unsightly appearance are exceedingly expensive in upkeep. Whilst realising that flying as a general method of transport is still very much in its infancy, and for that very reason the necessary funds will not, as yet, be forthcoming to erect elaborate aerodromes on the edge of every city, town and village, surely from the very start due consideration should be given to the points raised.

Even though there may be during the next few months comparatively very few passengers arriving at municipal aerodromes, or aerodromes owned by private companies, it is imperative that these few passengers should be made comfortable, and should have every service and convenience that they require, thereby encouraging others to follow in their footsteps. Above all, let us avoid the unattractive desolation often found in the earlier Railway Termini, with their ugly waiting-rooms, which are cold, draughty, unattractive, and very badly furnished, and have the general air of rather frightening one out onto the platform than of inviting one to go inside and sit down while waiting for the train.

So many new projects are spoiled at the outset, or at any rate are hampered to a very great extent, by the proprietors "making do" with some temporary building which usually remains as an eyesore for many years.

In dealing with this point in regard to aerodromes, it is not proposed to enter into a long discourse on the design of aerodrome hotels and club-houses, as they all, of course, require approximately the same accommodation either on a larger or a smaller scale, depending upon whether they are serving a large or a small town. As far as their architectural features and the internal details of lay-out go, these can safely be left in most cases to the skill of a competent architect and surveyor.

After all, the size of the dining-room and the number of lounges required must of necessity be ordained by local conditions and can in no way affect the successful running of an airport, unless, of course, they are on much too small a scale, and get their particular aerodrome a bad name for having insufficient accommodation.

MAIN BUILDINGS.

Let us turn to the main building of the aerodrome, upon the successful design and most efficient placing of which depends the success or failure of the whole venture. In referring to hangars, it has been remarked by a prominent Air Ministry official that the present hangars erected on the many aerodromes in the country, and, indeed, at most aerodromes in the World, are nothing more or less than large rabbit-hutches, usually of ill-considered design, most of them constructed during the War by inexperienced workmen and regardless of cost to the tax-payer either in their construction or in view of their future upkeep.

Attractive buildings of a pleasing appearance will always draw a crowd,—and experience shows that usually where a crowd collects round an aerodrome, sooner or later most of its members become enthusiastic pilots and passengers.

It is possible to produce a very attractive-looking hangar for a quite normal outlay, and at the same time one which will have under its roof most of the necessary aerodrome offices and only one central heating system, and what is more, a hangar upon which not one penny will be spent in upkeep.

It is obvious, of course, from the above statement that this hangar must be designed in reinforced concrete, so that if the work is carried out properly the first cost should be quite definitely the last. For some mysterious reason reinforced concrete is not as popular in this country for constructional purposes as it is, for instance, in France, Germany, or Italy.

THE NEW STYLE.—The wooden "mould" of the main ferro-concrete hangar at the Heston Air-Park.

THE FINISHED ARTICLE.—The Ferro-Concrete Hangar,—side view showing the external stairway to the entrance to the offices.

Many failures in reinforced concrete are entirely due to want of experience by those who are responsible for design and erection, and unfortunately in England many small builders seem to think that reinforced concrete is anyone's hobby.

The reinforced concrete hangar erected at Heston, for example, was designed in competition with a steel hangar of very light design. The only condition stipulated was that, whether the hangar was designed in reinforced concrete or steel, the main opening was to be 100 ft. clear between the supporting columns.

The usual steel design, with brick filling-in between the stanchions and with corrugated iron or asbestos roof, was not much cheaper than the concrete hangar eventually erected, and the painting of a steel hangar of the same size would cost at least £70 every few years. In this respect a larger hangar would be disproportionately more expensive.

In addition to giving the same storage accommodation for aircraft, this concrete hangar has six offices suspended from the roof at the southern end. An office floor is provided at the northern end, also suspended from the roof, which is to be used as a store space and can be eventually turned into more office accommodation if required at a later date.

In addition to this, along one side of the hangar, outside the supporting columns, there is provided a chief instructor's office, lavatory accommodation, also a workshop, and a machine shop, each 14 ft. by 20 ft.

The latter is fed by means of a travelling 30-cwt. Morris block, which will lift aeroplane-engines from their respective machines and convey them to the machine shops for any necessary repairs.

On the other side is a paint-shop with stores, and a dope-shop capable of taking two or three complete fuselages when they require to be painted, as well as a boiler-house and chief engineer's office.

None of these extras could possibly have been included in a steel design without great extra cost. In addition to all these conveniences the first cost of such a hangar is absolutely the last. There is no upkeep or painting to be paid for in future years, it is proof against fire, and a constant temperature is maintained inside the building all the year around.

For the municipal aerodrome which is just starting and upon which it is not desired to spend large sums of money immediately or on future upkeep, the reinforced concrete hangar which includes all the offices mentioned above seems to be the ideal building. Such a building looks graceful and adds to the appearance of any aerodrome.

Contrary to what one would expect to find, bearing in mind the fact that there are offices suspended from the roof at either end of the hangar, the building is extraordinarily well lighted, and it is quite possible for a mechanic to dismantle or re-assemble the smallest parts of an aeroplane engine in the hangar, even on a comparatively dull day.

With reference to the different types of hangars designed in reinforced concrete, experience seems to show that spans up to 150 ft. are best designed as tied arches, and that for hangars of larger spans a better design would probably be a parabolic arch springing off abutment slabs from below ground-level.

Moreover, the larger the hangar the more does reinforced concrete come into its own, particularly from the point of

FOR EVERY AIR PORT

MARCONI EQUIPMENT

Reliable communication is essential for the efficient conduct of aviation services.

Marconi wireless equipment for air ports and aircraft enables constant communication to be maintained between air ports and between the ground and machines in the air, for the circulation of information regarding weather conditions, aircraft traffic, and other matters.

At the same time Marconi equipment provides facilities for direction and position finding services, which have proved invaluable for the maintenance of regular flying schedules under adverse weather conditions.

Marconi aerodrome equipment is installed at the London Air Port, Croydon, and at the most important air ports in 15 other countries.

Marconi equipment for aircraft is used by all Imperial Airways machines and by civil, military and naval aircraft in more than 30 countries.

view of cost. In very large spans of say 300 ft., such as one meets in the reinforced concrete airship hangars at Orly, near Paris (which, incidentally, are among the most graceful examples in existence of reinforced concrete applied to the design of buildings), the cost compares more than favourably with steel design. Needless to say, a steel hangar of that size would cost many hundreds of pounds periodically for painting.

A reinforced concrete hangar of about 100 ft. span works out at about slightly under 3d. per foot cube, including the reinforced concrete suspended office floors provided at either end.

Hangars to accommodate very large aircraft of over 130 ft. span, such as the new four-engined Handley Page air-liners, can also be made to look attractive.

An accompanying drawing shows a proposed design of hangar with three open spans of 135 ft. This hangar is composed of three main girders bridging the 135 ft. spans on the front or open side of the shed.

Running transversely across the shed are secondary reinforced concrete girders of 100 ft. span, which carry the roof covering and are supported at one end by the main girders, and at the other by columns incorporated in the back walls of the shed. The roof can be constructed either of reinforced concrete or corrugated asbestos sheeting.

Different aerodromes, as aforementioned, would require different accommodation and different hangars according to local requirements. While on this point, it should be pointed out that there is a growing tendency for aircraft to be of greater wing-span, and therefore what may represent a saving to-day by building the hangar of minimum span for present-day requirements, say 100 ft., may mean that in the near future their use will be restricted, as they will be unable to accommodate the air-liners then in service. Most large passenger-carrying machines are to-day of about 110 ft. span, and there are very few less than 90 ft.

Looking still further ahead, it is quite within the bounds of possibility that double-decker hangars, like those at the new Littorio Aerodrome at Rome, may become the usual type of building for this purpose, offering the obvious saving of space on the aerodrome for double the accommodation.

Turning to the question of hangar doors.—The number of the different types of these is legion, but experience shows that for small doors up to about 25 ft. high the most effective kind, and also the most simple to operate, would seem to be the folding door of a concertina type, worked by means of a simple winding gear easily operated by one man. This type of door when properly made and erected, really is exceedingly efficient. For large sizes one can use the "Round the Corner" type of door, which is very popular for aerodromes in America.

This consists of a number of sets of doors loosely hinged together, about four or five in each batch, according to the size of the hangar. Each of these sets is pushed in turn to the side of the hangar, where they are deflected by means of an ingenious device after the style of the points on a railway, round to a number of curved parallel tracks, so that they are stored neatly out of the way, and shoulder to shoulder along the side of the hangar, as shown in the photograph.

AN AERODROME LAY-OUT.—Runways as used on American aerodromes.

Thirdly, there is, of course, the usual sliding door, which stands out on either side of the hangar when opened, and these, when properly designed, should be perfectly satisfactory and quite easy to operate. In very large doors of this type it will probably be necessary to use some form of electric power for opening and closing.

Lay-Out.

Finally, with regard to aerodrome lay-out.—It is quite necessary that the aerodrome buildings should be close together for convenience, and so placed that they are facing directly across, i.e. at right angles to the path of the

FOR LARGE AIRCRAFT.—A scheme for a hangar with three spans of 135 ft. each,—Front and end elevation.

machine which would be taking-off or landing into the prevailing wind in the district. This ensures that at any rate during the larger part of the year machines would land and take-off in full view of the Club House and hangars, and with no high buildings to climb over on leaving the ground,—thereby minimising all risk of serious accident should the engine or engines cut out when the aeroplane is only a few feet up.

While on the subject of obstructions around the aerodrome over which the aircraft on leaving would have to climb, it should be remembered that any tall object on the edge of the aerodrome diminishes the effective use of the field by six times the height of the object, i.e. a 30 ft. chimney diminishes the useful area of the aerodrome for taking-off in that direction by 180 ft.

Many accidents have occurred through inefficiently drained aerodromes, though there are instances where it is impossible to do this properly, such as Renfrew Aerodrome, near Glasgow, where the aerodrome surface is actually lower than the level of the river running alongside. The day must come when either tarmac or concrete, or some other substance, will replace the present grass surface. Before this can be realised, however, all aeroplanes will have to be fitted with tail-wheels and front-wheel brakes, instead of the usual tail-skid of to-day. [NOTE:—Might not the reverse be the procedure? Concrete surfaces would compel makers to fit tail-wheels, because the hard concrete would wear out or break skids, and probably damage the fuselages. And machines without brakes would run too far.—C. G. G.]

To avoid the expense of covering the whole of the aerodrome surface with concrete, the Americans have devised the scheme shown in the accompanying sketch. Concrete runways are provided in almost every conceivable direction, so that the machine can always land head-to-wind, or as nearly so as would not matter, and yet only about a half of the aerodrome surface is actually covered.

Until, however, surfacing of aerodromes becomes an accomplished fact, the most important point when equipping a new aerodrome is undoubtedly efficient surface drainage.

It would be wanting in forethought to finish an article of this description without referring to what is bound to become one of the most important types of air-port in the future, namely, the "Seadrome," or perhaps one should say the Aerodrome and Seadrome combined. Something of this type is now under consideration at Hull, where the actual aerodrome itself was opened recently by H.R.H. Prince George.

The seadrome must, of course, be in a harbour, or some naturally sheltered portion of the coast, and as far as the actual constructional side of the seadrome goes, there is nothing much more in it than reinforced concrete slipways leading up to the hangars on the shore. Incidentally here, more than anywhere, should the reinforced concrete hangar come into its own, owing to its being entirely impervious to the chemical action of the damp salty atmosphere.

With the ideal aerodrome of this type the hangar would be open at either end, one end leading to the sea for flying-boats, and the other onto the ordinary aerodrome where land-planes would be waiting to convey the passengers from over-sea to their several destinations. With a lay-out that enabled the hangars to be placed side by side and open at both ends, they could be used for both the land and sea-planes, and the consequent cost of erecting separate hangars for the different types of aircraft would therefore be avoided.

BRISTOL—THE AIR-PORT OF THE WEST.

By B. F. Brueton, A.R.I.B.A. (Illustrations by courtesy of the City Engineer, Mr. L. S. McKenzie.)

The Spirit of Adventure, which made Bristol famous in the Middle Ages—when her merchants planned and her sturdy sailor sons dared mighty ventures and voyages (one of which resulted in the discovery of America by Sebastian Cabot)—is still very much alive in Bristol to-day. She has her extensive docks at Avonmouth fully equipped to deal with all classes of water-borne traffic. And it is the ambition of the modern Merchant Venturers to see her take that place as the Air Port of the West for which her geographical position so eminently suits her. To this end the Corporation has acquired a magnificent site and is erecting a hangar, club-house and other buildings as the first items in an ambitious programme.

The new Air Port lies on the clear side of the City, the site is level and is only two miles from Temple Meads Station (as the 'plane flies). At present the distance by road from aerodrome to station is 4 miles, but this will be reduced to 3 miles by the construction of a new road referred to later. These figures will serve to show that Bristol will be singularly fortunate in the matter of terminal travel.

The Air Port covers 290 acres. It includes a landing-ground of about 180 acres, the natural levels of which are extraordinarily good and the work of preparation is well advanced. There will be about 20 acres set apart for the air-station buildings, hangars, etc. And the remainder (about 90 acres) will be available as sites for service and repair shops, showrooms, and (it is hoped) aircraft factories.

At present there is road access only on the South, the side remote from the City. The site is, however, situated between the routes of two Ring Roads planned in the Town-Planning Scheme. The existing road is to be widened and incorporated into the outer Ring Road, and a new road (intersecting the site on the North) will form part of the inner Ring Road. This new road will probably be put in hand as an unemployment relief scheme.

The site is thus very happily situated as regards road

access as these two ring roads will tap all the arteries converging on the City.

The air-station proper is planned to be approached from the Inner Ring Road. Here will be a spacious square or *place* and a short avenue leading to the station buildings. It is hoped that the complete scheme will include waiting-rooms, Cafe-restaurant, headquarters and meteorological and wireless control, etc., together with hangars to accommodate every type of aircraft. Flanking the station approach road will be sites for show-rooms. And it is intended to reserve a site for an hotel.

Stretching away on either side of this centre are sites, fringing the landing ground, which will be (it is expected) quickly snapped up by the principal aircraft-manufacturing aircraft-operating, and engineering firms, and those dealing in accessories and specialised products of the industry. In this connection it may be well to say that the Corporation are now prepared to offer sites on very reasonable terms in order to expedite the establishment of the Air Port.

A site of 3 acres has been leased to the Bristol and Wessex Light Aeroplane Club, who are to act on behalf of the Cor-

The first Aerial Service Station in Britain was installed by Pratts.

poration as managers of the Air Port during its infancy. Here the Corporation are erecting the first hangar, a Club-house, a Show-room and private lock-up hangars, to form a nucleus for the first stage of development.

The hangar, 120 ft. by 60 ft., has workshops, offices, and messroom, etc., attached. The Club-house (now nearing completion) comprises Lounge, Dining-room, Bar, Changing-rooms, and service quarters. There is a flat roof from which members may view the flying. The Club hopes to lay out tennis-courts, lawns and gardens, and to make the spot an attractive social centre.

Construction of the first Show-room and block of private lock-up hangars has been authorised and will be begun shortly. These buildings will be let on reasonable terms by the Corporation, who wish to attract business and encourage the growth of the new venture

It is hoped to obtain a licence for some portion of the site as a landing-ground early in the New Year, and it is intended to arrange a formal opening and Air Pageant in the coming Spring.

A SIGN OF THE TIMES.

The following letter in the *Daily Express* shows how air-minded the populace is becoming.

Air Ports for the Future.

Sir,—I suggest it is time to grasp the command of the air by immediately laying out air ports at each of our sea-ports. No time should be lost, otherwise suitable landing grounds will be encumbered with private houses and second-class roads.

This plan would be a tremendous relief to unemployment, and a gain to national prestige

KENNETH W. RAINBOW.

East Flexford, Guildford.

TO KEEP OUT THE WEATHER.

Hangar doors are a bit of a problem. They have to cover such a big area that they are apt to be awkward to handle and to take up a lot of space when open. They have to be robust to withstand big wind pressures, and yet they must be easily handled.

The Esavian door, produced by the Educational Supply Association, Ltd., appears to combine adequate strength with simplified handling. These doors were widely used during the War 1914-18, and over ten miles of them were erected. From which one may infer that these doors are based on a well-tried principle and have had plenty of time to prove their worth.

They are to be seen at the new Air Parks, such as Hanworth. At Heston they are quite a feature of the place, and are easily visible on any picture of Airwork's new concrete hangar. Many have been in use for a long time on the Air Ministry aerodromes.

The principle underlying the construction of these doors is the familiar one of folding a large area in small panels, like the panels of a camera bellows.

Each door has a number of strongly constructed uprights sliding in runners along the top and bottom of the hangar opening. To each upright are attached two leaves, which are hinged in turn to corresponding leaves attached to the uprights on either side. When the uprights are run together these panels fold outwards exactly as when one shuts a camera. These doors are operated by means of a small winch attached to the doors.

AIR PORT STRUCTURES.

STANDARD HANGARS.—The double and single types of sheds built by E. D. Winn and Co. Ltd. at Hanworth.

As everybody knows now, National Flying Services, Ltd., have a programme for the creation of aerodromes all over the country, and as part of this policy they will naturally have to erect hangars and club houses.

This structural policy has been standardised, and the firm has fixed on two types of hangar, double and single, together with a bungalow club house.

E. D. Winn and Co., Ltd., whose name has become familiar by frequent repetition around the hoardings of new buildings, are undertaking the building side of the N.F.S. programme. One noticed the other day that this concern are also building the new Ice Rink at Golders Green.

This firm, who are to be congratulated on their foresight in entering into the aeronautical field, have already been quite active. At Hanworth they have modernised the inside of the Club building. They have built two hangars, one of the single and one of the double type. They have also built the workshops where all the repair and replacement work from all the N.F.S. Air Parks will be done.

The usual method of construction employed by this firm is the well-proven one of having steel-girder structural work with a special tile for the roofing and a suitable material for the walls and ends.

In this particular case, an interesting form of sheeting is being used. This consists of a kind of corrugated sandwich, the two sheets of metal enclosing a special insulating material. The outsides of this sheeting are also protected by a coating which renders them impervious to most kinds of attack.

The floors are made either of a material referred to as Mastic, or, in the case of the workshop, are laid with concrete.

As one may imagine from this outline of the method of construction employed, the steelwork forms a very important side of the business. All the steelwork for the buildings built by Winns' for N.F.S. has been supplied through the London and Wales Steel Construction Co., Ltd., of Greville Street, E.C.1.

Digitized by Google

REPAIR SHOPS.—The main work-shops built by E. D. Winn and Co. Ltd. at Hanworth.

E. D. Winn & Co., Ltd., are also responsible for the N.F.S. buildings at Hull, the opening of which was reported in The Aeroplane of October 16.

NISSEN AERODROME STRUCTURES.

The name Nissen conjures up memories of some of the most comfortable of the various types of temporary living quarters that aggressive man was called upon to live in during nineteen-hundred-and-war-time.

Nissen huts were the invention of Lieut.-Col. P. N. Nissen, D.S.O., and were at once recognisable by their semi-circular cross-section. Their structure consisted essentially of a series of arched steel ribs, spaced at uniform distances apart and interconnected by either steel or timber longitudinals to which the exterior covering, generally of corrugated iron, was attached. An interior lining of any suitable material could be attached if required.

The ends were closed by timber or metal frames, with doors or windows, and additional lighting was provided by glazing sections of the outer covering.

The advantages of this sort of structure are many. In the first place the simpleness of erection, the interchangeability of a small number of standard parts, the expandability and demountability are highly important features.

Secondly the shape of the structure eliminated the use of rain pipes and guttering on single spans.

Thirdly the inner lining prevents condensation and helps to provide an equable temperature.

Since the War, 1914-18, Nissen Buildings, Ltd., of Rye House, Hoddesdon, Hertfordshire, has developed the Nissen system of construction to suit it to all possible uses. One of these uses is of direct interest to all aircraft users in that the company now produces standard sections for aircraft hangars. In addition, their standard buildings are eminently suitable for aerodrome use for general living quarters, stores, workshops, offices, club accommodation, etc.

The general construction of the standard buildings has already been briefly described and the present patented system is to all intents and purposes the same.

The arched steel ribs, of "T" or "H" section, are made to a series of standard spans, ranging from 16 ft. to 50 ft. The form of arch gives a rigid construction capable of bearing heavy loads. These arches, placed at 6 ft. centres, are interconnected by timber or steel purlins.

The standard roofing material is galvanised corrugated steel, the sheets of which are curved to the exact radius of the respective spans. The inner lining, which can be of light-gauge corrugated sheet, asbestos cement sheet, fibreboard, plaster, or metallic lathing, or match-boarding, is secured to the inner flanges of the arched ribs. Apart from insulating the building against extremes of heat and cold, the inner lining improves the appearance and makes the structure eminently suitable for furnishing as living quarters, etc.

The end gables can be varied as regards framing, covering material, type of doors, windows, etc., and internal partitions can be introduced to suit the type of building required.

Special roof or side-lighting may be provided by substituting wood or steel glazing bars and glass for certain sections of the standard outer covering.

The foundations for the buildings need only be of a light and inexpensive character, but the Nissen building is not merely a temporary structure, though it can be made so if desired.

Owing to their lightness, to the employment of standard sections, to the compact way in which the sections may be packed for shipment and to the ease with which the buildings may be erected by unskilled labour, Nissen buildings are being supplied in considerable numbers for erection overseas, and are particularly serviceable in countries where ants and other insects would quickly destroy structural woodwork.

A series of wind-pressure tests on the semi-circular section Nissen buildings have been made by the National Physical Laboratory at Teddington. It was found that the buildings were almost as stable under all test conditions as in still air. Such a condition is almost impossible in any square-sided building where elaborate precautions are, or should be, taken to prevent collapse during severe storms.

A special design of aeroplane hangar has been developed which departs from the standard Nissen form of structure. It was designed however with the same consideration of interchangeability, ease of erection and cheapness that characterise the standard type of building.

Owing to the difficulty of getting adequate height near the sides of a semi-circular section building together with the unnecessary height that is provided at the centre of a big span building of that form, side walls have been intro-

A PORTABLE HANGAR.—The Boulton and Paul Hangar erected in Borneo.

duced, together with a flattened roof span. By this means a hangar 70 ft. x 65 ft. has been produced with a maximum height of only 19 ft.

On the front end are mounted a series of doors running on overhead guide-channels. These channels are extended beyond the side walls so as to leave an unobstructed opening for the full 70 ft. width of the building.

Around the three remaining sides are lean-to annexes giving room for offices, workshops, stores, etc., with access to the main building but not interfering with the main floor space.

A number of these hangars have already been erected and are giving excellent service.

The company claims that their buildings are the cheapest all-steel structures of their kind obtainable in this country.

All bodies or institutions which are contemplating the erection of aerodrome buildings of any kind are strongly recommended to consider the advantages offered by the patented Nissen construction.

AN AIR PORT NECESSITY.

Some time ago Ransomes and Rapier Ltd., of Ipswich, produced a Petrol-Electric Mobile Crane which has proved itself exceptionally well adapted for use in connection with aircraft. Approximately thirty of these machines have been supplied to the R.A.F. for use in aircraft depots, and others have been supplied to users in over twenty-eight different countries, where they are all giving excellent service.

The crane is a self-contained unit mounted on two wheels on a fixed axle forward and two castor-wheels aft. The two castor-wheels are mounted close together and act as the driving and steering wheels of the crane.

The power-unit of the crane is a petrol engine of motor-car type which is directly coupled to a specially-designed variable-speed electric generator. This generator supplies power to four separate motors, two of which operate the travel, and one each the hoist and derrick motions.

A simple method of varying the speed of the main generator assures that no current need be generated in excess of what actually is needed to drive whichever motors may be in use at any given moment.

The crane is made in four sizes, to lift 1, 2, 3½, 5 and 6 tons respectively. Owing to the articulation of the castor-axle the load is always equally borne on the two driving-wheels and consequently the torque exerted is correctly shared by the two travel motors,—each of which drives one wheel. This articulation of the castor also enables it to adjust itself to uneven ground.

For complete operation of the crane there are only a steering wheel, an accelerator pedal, a brake pedal, and three control levers, one each for the derrick, hoist and travel.

By manipulation of the steering-wheel the castor-wheels can be turned through a right angle in either direction. By this means the crane can be made to travel either straight ahead, or in a curve of any radius, or to rotate about the midpoint of its front axle.

A specially bent crane jib has been developed for aircraft work which facilitates the lifting or placing of engines in multi-engined aircraft, where the engines are very close to the under-side of the upper planes. This design of jib requires the minimum of head-room for the lift.

The crane-jib, in addition to the normal hook-gear, can be fitted with a self-dumping grab or bucket and the wheels may be replaced by two caterpillar tracks.

These modifications make the crane eminently suitable for general building operations levelling land, etc.

A special folding platform or tray may also be supplied for attachment to the front of the unit. Where a crane is required to pass into, or out of, a building with a low doorway the load may be lowered onto the platform, the jib lowered to a horizontal position, and the crane together with its load may pass into, or out of, the shed. Once through the doorway the load may be transferred to the hook.

Full particulars of these cranes can be obtained from the manufacturers, Ransomes and Rapier Ltd., Waterside Works Ipswich, or 32, Victoria Street, London.

THE DRAINAGE OF AIR-PARKS.

A question of paramount importance in the construction of aerodromes and air-parks is that of adequate drainage. Flying grounds are by necessity flat. Also, because of the necessity for having good approaches, they are very often in the midst of flat and level country. Such conditions do not make for good natural drainage.

A spell of wet weather is sure to make the surface soft, even if the water does not collect in pools. Our barbarous habit of using tail-skids does the rest, for these tail-skids plough furrows for the next machine to fall into. To remove these furrows the surface is rolled, and this procedure after a while results in a puddled condition of the surface that prevents the water from draining away.

In The Aeroplane for Feb. 8, 1928, there was a description of the methods employed to drain the aerodrome of the De Havilland Co. at Stag Lane. These operations were very successful, and the former quagmire-like condition of parts of the ground have been removed.

Mr. Charles Herridge, who has recently formed the Herridge Land Drainage Co. Ltd., was responsible for these operations, and the means he employs to achieve his ends are interesting.

A small petrol-driven winch is used to draw a special coulter or cutter across the ground. These coulters have an arrow-shaped cutter supported by two vertical arms whose edges face the direction of attack, thus offering the minimum resistance. About a foot above the cutting edge is a heavy plank to which the arms are attached. When the front end of the plank is fastened to a rope from the petrol-driven winch and hauled across the ground the cutting edge sinks in and down until the plank is hard against the surface and so ploughs a trench about a foot deep.

With such a tool alone the debris just falls back into the trench, so another tool is employed which consists of a wedge-shaped wooden structure towed immediately behind the cutter. This elevator, as it may be called, is the same width as the cutter, and therefore rides easily along the trench.

The underside of the wedge runs along the bottom of the trench, and the other rises from behind the cutting edge to well above the trench. Thus the debris is forced up the elevator to above the top of the excavation, and is then made to fall to one side or the other by an arrangement of deflectors.

In heavy clay and employing two men (one at the winch and one at the excavator) a 500-yard cut to take 6-in. drain-pipes, and 2 ft. deep, can be made in an eight-hour day.

For the subsidiary drains an ingenious tool known as a "mole drainer" is employed. This consists of a pointed iron cylinder of 3-in. diameter carried on a vertical arm with a cutting edge in the direction of movement. This arm, which is adjustable for depth, is fixed in a plank which has two wheels at its aft end. When this plank is towed along, the pointed cylinder bores a tunnel under the ground with a narrow slot to the surface made by the arm.

Mr. Herridge tells us that he now has an improved form of this tool which strips the turf in front of the tool and then replaces it so that no trace is left on the surface by its passage.

Mr. Herridge drained part of Kenley aerodrome for the Air Ministry, and tells us that he has now been called in for the Bristol Corporation Air-Park. He has even received inquiries from so far afield as the Littorio Air Port at Rome and that at Bangkok in Siam.

HERRIDGE DRAINING.—The system of draining described in the opposite column.

AIDS TO DRAINAGE.

One of the encouraging signs to be noticed everywhere is the way far-sighted business people are beginning to put irons in the aviation fire. Rumours have been afoot since the Aero Show as to the intentions of some of the big motor firms.

Moxons Ltd., who are a firm of general engineers, have been devoting a part of their great resources to the production of drainage equipment for some time. They have also done quite an amount of drainage work themselves.

To cope with really heavy drainage work, this firm have produced an amazingly powerful winch, mounted on a tractor and driven by the engine of the tractor. By using a combination of gear-boxes a terrific range of gears is obtained which permits of a big range in the class of work employed.

For pulling stumps, this winch can be anchored to the ground by special attachments at the rear and mid-parts of the chassis. The steel cable from the winch is then

hitched onto a tree-stump and the engine started. The clutch is let in, the rope tightens, and up comes the stump.

By placing the winch some way from the line of stumps the apparatus can be used to demolish a hedge in a very short space of time with only one setting-up. At the end of the job the ground-anchors are undone and hitched up to the tractor, which can be driven off to the next site.

A neat arrangement has been perfected whereby the pipes can be laid automatically by a chute behind the elevator. The chute is kept filled by a boy dropping in pipes every now and then.

This trench-making apparatus does everything from the excavating to the pipe-laying. One can only suggest that means are found to fill in the trench over the pipes. This would make the whole operation more or less automatic.

Moxons Ltd., besides building this winch, design and build all forms and types of draining tools. They specialise in the production of implements for dealing with very hard ground and for making really deep cuts. They have recently drained a number of aerodromes over the country.

INTELLIGENT ANTICIPATION.

In these days of fast cargo vessels, goods sent to Australia and New Zealand from this country often reach their destination before the necessary documents have reached the consignee. Such documents are sent by mail steamer, which has, unlike the cargo boat, a number of ports of call.

To obviate this delay the merchants engaged in the Australian and New Zealand trade have requested the ship-owners to issue a special bill of lading for transmission by Air Mail, and this has been done. The bill is about one-quarter of the usual size and is printed on thin paper, so that it can be sent as cheaply as possible by Air Mail.

Besides illustrating the shrewdness of the merchants, this is further evidence of the value of Air Mail possibilities.

THE INSPECTION AND TESTING OF AERO ENGINES.

One of the most instructive exhibits at the Aero Exhibition at Olympia, London, was that of the Aeronautical Inspection Directorate of the British Air Ministry, which showed the whole system of inspection from the raw material up to the finished aeroplane and its engine. A particularly interesting feature on this stand was the full-sized brake-testing apparatus used for trying out the 215-230 h.p. Armstrong Siddeley Lynx engines.

At one end of the plant is a powerful fan which creates a current of air and drives it under the dyanamometer and through a tunnel on to the forward face of the Lynx engine. The brake-testing apparatus is fitted between the engine and the fan, and is driven by a shaft which is coupled up to the engine and passes through the cowling of the tunnel.

The Lynx engine is fitted on a mounting which is formed with a trolley. This runs on rollers, so that it can be wheeled up to the mouth of the air tunnel and withdrawn at the conclusion of the test with the least possible waste of time.

THE MOXON DRAINAGE OUTFIT.—This shows the semi-automatic pipe-laying chute in action.

AN ENGINE-TESTING PLANT.—An exhibit at Olympia in July of the method used by Armstrong Siddeley Motors for testing Lynx engines.

WIRELESS FOR AIR PORTS.

From the earliest days of flying, far-seeing people realised that wireless communication, the only practical means of communication over any considerable distance between persons on the ground and persons in the air, was likely to be of as great importance to commercial aircraft as it is to ships at sea.

The main difference between the ship and the aeroplane is that efficient communication at all times is in some respects even more important to the airman than to the seaman. In case of fog or weather conditions unsuitable for making port, a ship not fitted with wireless or a wireless direction-finder can go dead slow or heave to for days if necessary. But when caught in fog or storm the aeroplane has to proceed and to find its way to a safe landing. Wireless is thus practically a necessity to aircraft services if they are to maintain a regular schedule through the ever-changing moods of air and sky with their storms, clouds, mists, and fog-banks.

The rapid and continual progress made in the reliability and range of modern aircraft has therefore necessitated the development of an efficient system of wireless services for aviation purposes.

The pivots of this organisation are the Air Ports, equipped with wireless to enable them to maintain regular contact with each other and with aircraft. This system provides for the distribution of meteorological information, route-traffic between air ports, communication between air ports and aircraft, and direction- and position-finding.

Though the design of modern aircraft and the services of wireless have to-day rendered flying possible under weather conditions which only a few years ago would have been regarded as prohibitive, the state of the weather is still an important factor in aviation. One of the first aids of wireless to aircraft is therefore the rapid circulation of information about weather conditions.

Meteorological information is usually circulated between airports in the form of long figure code messages, but if it is necessary to communicate this information to pilots, telephony or telegraphy messages are sent *en clair*.

Where an organised air-route is established between fixed points it is of vital importance that an efficient system of wireless communication should exist, so that messages concerning the departure and arrival of aircraft, instructions to land at intermediate bases, information regarding transport of passengers and goods, and the many points of detail which are essential to the smooth working of an efficient air organisation, may be communicated without delay.

The exchange of similar information is equally of value between civil air-parks dealing with independent aircraft, as a constant check can thus be kept on machines in the air at any time.

For communication between Air Ports and pilots in the air telephony is usual. In large passenger-carrying machines a wireless operator is carried. Long-distance communication is generally done with continuous wave telegraphy.

The range over which aircraft and air ports can keep in touch with one another naturally depends on the design and efficiency of the wireless equipment used and on atmospheric and other conditions.

An Imperial Airways pilot flying near Cologne, Germany, has held direct conversation with Croydon, and a test transmission on short waves from an aeroplane over Croydon in July, 1928, was picked up as far afield as Cairo.

One of the most valuable uses of wireless for aircraft is that it can give the position at any time of aircraft in flight. Though the ordinary methods of navigation can be used with reasonable success in the air, certain conditions of weather arise when these methods may become misleading and in some cases useless. Especially is this the case in fog and mist.

Practically all modern aerodrome wireless stations are therefore equipped with direction-finding apparatus, and a pilot in doubt as to his position can call up an air port and ask for his position to be given him. This is done by two or three ground-stations working in co-operation. From their joint observations a "fix" is worked out and the information as to the aeroplane's position is then transmitted to it from the controlling ground-stations. With practised operators, when a position is asked for, the information can be provided in less than a minute and a-half.

So precise has this method of navigation become that pilots have often flown with wireless guidance between Croydon and the Continent when the ground has been invisible practically throughout the flight.

The London Terminal Aerodrome, which was opened at Croydon in January, 1928, is a remarkably fine example of modern wireless organisation as applied to the control of air-line operations.

Eight years of practical experience with the old aerodrome wireless station at Croydon enabled the Air Ministry, in conjunction with the Marconi Company, to devise a new and greatly improved system of communication. Four transmitters, each of 4 kilowatts power, working on different wave-lengths, and direction-finding receivers embodying the latest improvements in wireless technique, were installed for communication with aircraft in flight and with other aerodromes.

The wireless control of aeroplanes and the direction-finding services are centred in the Aerodrome Control-Tower. In the wireless room, situated in the tower, a wireless officer is in constant touch with the aeroplanes in flight. He is in control of the direction-finding receiver, and of three of the four transmitters at the transmitting station at Mitcham, some 2½ miles from the aerodrome.

One of these three transmitters is arranged to transmit telephony on 900 metres, the second telegraphy on the same wave, and the third is a stand-by for emergency use. The fourth transmitter is controlled from the separate Route-Traffic Wireless Room.

In the near future an alternative wave-length of 870 metres for working telegraphy, and an alternative wave-length of 930 metres for working telephony with aeroplanes, is to be adopted, thus leaving the 900 metres wave more free than it is at present for the passing of distress and other urgent messages from and to aircraft. As all the transmitters can work on any wave-length between 800 and 2,000 metres, a change in wave-length is simply a matter of adjustment.

Some distance from the Control-Tower is the Route-Traffic

AIR PORT WIRELESS.—The Radio-Board in the Control-Tower at Croydon. The dial on the left is the Direction-Finding Indicator.

Wireless Room, where communication is maintained on 1,380 metres wave-length with other aerodromes, for the exchange of messages dealing with the departure of aircraft and other service matters. The wireless officers in the Control Tower and in the Route-Traffic Office work independently of each other. All messages received, either from aircraft or from other aerodromes, are however passed to the Aerodrome Officer on duty in the Control Tower.

Direction-finding stations at Pulham and Lympne collaborate with the Croydon wireless station. When the pilot of an aeroplane sends a request to Croydon for a position, Pulham and Lympne, at which stations a constant watch is kept, simultaneously take his bearings. Pulham and Lympne then send their bearings to Croydon by wireless, and these, together with Croydon's bearings, are plotted on a large map mounted under glass in the wireless room. The point on the map where the three bearings cross is the position of the aeroplane and this reading is communicated by Croydon to the aeroplane.

THE WIRELESS EQUIPMENT AT HESTON.

The wireless installation at Heston is situated on the second floor of the Control Tower, and consists of the Graham ½ K.W. Intermediate Air Port Equipment.

The whole installation occupies a single mahogany bench. On the right is the transmitter proper which contains the oscillatory circuits, the oscillating and modulating valves, the various meters and controls and the rectifying and smoothing system.

Four wave-lengths are continuously available, namely 600 metres (for emergency communication with shipping if necessity arises), 764 metres (the wave-length allocated to Heston for flying training purposes), 900 metres (for intercommunication with commercial aircraft if required) and 1,500 metres (for communication with the largest passenger machines using wireless telegraphy). The whole apparatus can be changed from one wave-length to another in about one second. Continuous wave, interrupted continuous wave, and radio-telephony are provided and can be instantaneously switched as desired.

The unit on the left contains the sub-modulator panel, to control the transmitter, and underneath, a receiver which is continuously available from 250 metres to about 20,000 metres. Here again change can be made from one wave-length to another in about a second, and only involves the turning of a single switch. The well known Amplion microphone forms an important part of the equipment.

Some thoroughly satisfactory tests have recently been made between this equipment and that at Croydon and Rotterdam aerodromes, and reports on the speech from the Heston equipment show that excellent results have been obtained.

The new Graham direction-finding unit will be added to the installation within the next few weeks and then Heston can be regarded as being a really modern Air Port and one which can be used by any class of aircraft in exactly the same manner as Croydon is used. If it be true that Heston is the least fog-bound air park in the London area—as there seems every reason to believe—it will be well worth remembering that full wireless facilities are available there at short notice.

THE GRAHAM AEROPLANE EQUIPMENT.—Here a pilot is seen receiving a message.

One very interesting feature about the set is that it runs entirely from alternating current mains, and that there is not a single part or piece of moving machinery in it throughout. There is therefore no noise.

The uses of this transmitter, apart from possible communication with ordinary commercial aircraft, are twofold. Firstly, Heston has become the London light aeroplane centre for meteorological purposes, and there is every reason to hope that within a very short time the Heston transmitter, perhaps in conjunction with a number of other air-parks in the British Isles, will be broadcasting once every hour an authentic weather report for the benefit of light aeroplanes.

Secondly, this transmitter is being used for training pupils to fly,—by using it in conjunction with the Graham G.A.6 light aeroplane equipment which is attached to the standard voice pipe fittings.

THE GRAHAM AIR-PARK EQUIPMENT.—Mr. Baker, Chief Instructor at the Heston Air-Park, is here seen talking to a pilot in the air.

A USEFUL TRACTOR.—The Citroën-Kegresse Tractor, with caterpillar tracks,—as used at the London Terminal Aerodrome at Croydon. This type is used by Imperial Airways Ltd. to haul machines about, and for the transport of a big mobile flood-light for night-landings. It may also be used to haul surface-graders, and to do the work generally of a young traction-engine.

This G.A.6 unit is carried in the front cockpit of any standard instructional machine which is equipped with a fixed aerial.

This set weighs only 4¾lbs. and is only 8¾ in. by 5¼ in. by 4¾ in. in size. This, for the range obtainable with a fixed aerial, and considering that four modern valves are used, places such apparatus in an entirely fresh category, and marks much-wanted progress.

It is in fact, certain that the equipment is the smallest and lightest for use in any aircraft to-day and is exceeding robust. There is the further advantage that such items as may occasionally need replacing are obtainable in almost any ordinary wireless shop.

When this set is used for flying training the usual practice of the instructor occupying the front seat and the pupil sitting in the rear seat is followed up to the solo stage. When a pupil is ready to go solo, for the first two or three times the instructor switches on the wireless in the front seat and gets out of the machine.

If during the solo flight the pupil shows any signs of getting into difficulties, the instructor can at once tell him what to do by wireless, and moreover, it should be observed that the pupil hears the familiar voice in a normal manner just as if the instructor were still in the machine.

The Air-Work Moth G-AACY has been fitted with a Graham set of this kind and has already been seen at the various pageants and flying meetings.

This Graham equipment made itself really useful on the Sunday morning after the Newcastle Pageant. Cramlington Aerodrome was submerged in thick mist, drizzling rain and drifting smoke from the city, and visibility was very low.

Mr. Sinclair and Mr. Windsor who had flown G-AACY to Cramlington and were anxious to get home, sat in the cockpit and listened until a *temps actuel* was intercepted from Croydon to a French machine. This report clearly indicated that although there was quite a lot of wind in the South of England, flying conditions were otherwise excellent. Consequently they pushed off, and soon after leaving Durham the weather cleared up and visibility was as much as 30 miles.

This single occasion in itself ought to be a strong inducement to every private owner and every light aeroplane school to carry one of these equipments on board, especially when one remembers that fixed aerials of a really convenient nature are standard.

A GRADING-MACHINE FOR AERODROMES.—The Howard 8 ft. Road-Grader at work on Croydon Aerodrome during a demonstration. This grader for maximum efficiency requires a tractor of 30 h.p. James and Frederick Howard Ltd. are well known as constructors of machinery for road-building and similar work. They now realise the possibilities of their apparatus for aerodrome construction. This machine can be used for removing ridges and conveying the material from the high spots to the holes. Finally the grader will make the whole surface level and smooth.

Consult N.F.S

ONE of the primary functions of National Flying Services, and one which the nature of their organisation makes specially appropriate, is that of technical advisers and consultants. The board of N.F.S. comprises more varied and extensive flying experience than that of any other aviation company. The staff of N.F.S. comprises, in each department, acknowledged experts in daily touch with the selection, equipment and management of aerodromes and the operation, purchase, and maintenance of aircraft. The activities of N.F.S. embrace every phase of flying.

As a result, N.F.S. are in a position to give technical advice and assistance on every aviation matter. From the selection and lay-out of an airport to the equipment of a private landing ground; from the insurance of a fleet of aircraft to the purchase or hire of a private single-seater; from the preparation of a schedule of maintenance for an air-line to advice as to the condition of a second-hand machine.

Whatever the subject, N.F.S. give good counsel at a moderate cost.

ANOTHER LESSON.

The lamentable wreck of the Short Calcutta G-AADN off Spezia on Saturday, Oct. 26, is another example of the low progress which humanity makes in new arts and sciences. Lines of development which are perfectly obvious are neglected simply because those things which already exist do well enough to satisfy the limited ideals and intelligence of their users. And yet humanity is singularly contradictory, for it may be seized by a craze, and all over the World people who are supposed to be first-class engineers or first-class scientists or first-class business men follow the leaders like sheep. And when an individual, possibly a company, tries to break away from the herd, he is either regarded as a revolutionary, or else he has to work for years before other people follow him on the right path.

The first, but not the most important, lesson that the Spezia tragedy teaches is the folly of the present craze for three-engined aircraft. People who ought to have known better, and ought certainly to know better by now, have preached and are still preaching that three engines mean infallibility. Three engines mean nothing of the kind. Three engines only mean a greater risk of one engine breaking down.

Certainly, three engines all working under almost exactly similar conditions in a flying-boat are less foolish than three engines in a tractor machine, in which the nose engine cannot possibly be doing anything like as much useful work as is either of the wing engines. But even when you have three engines all working under similar conditions, the loss of one engine does not leave enough power to give full control or lift.

Admittedly, there are machines which with full load will fly and even climb on two engines out of three, and the Short Calcutta is among them. But how long such machines will go on flying on two engines out of three when they are put into regular use is quite another story. Wings lose shape slightly, rigging may not be maintained in absolute truth, engines lose power, and your three-engined machine minus one engine ceases to be safe.

And at best, two engines cannot give the same control as is given by all three.

When we come to four engines we are up against a different proposition. Four engines, placed in tandem pairs, can be disposed so that they work much more efficiently than any combination of three engines. Moreover, as two of the engines drive pusher-screws, half the power is certainly being used much more efficiently than it is in any tractor aeroplane. The proof of this is that in the Dornier and other aircraft in which tandem engines are used the machines will get off using their pusher screws only, and will not get off using their tractor screws only.

In an aircraft of the size of the Do.*x* there are so many engines that when one or two cut out there is still plenty of power left. Moreover, the engines are so placed that unless the cause of stoppage is a major breakdown, they can be put right while still flying.

In considering these arguments we must remember that though there is proof that G-AADN did come down owing to engine-failure, the Jupiter engine has been proved to be one of the most reliable in the World, and was, therefore, much less likely to break down than the majority of engines would have been. And, whatever the strength of the gale may have been, there is no reason to think that the machine could have been forced down merely by the wind.

The most likely cause of the descent is that it ran short of petrol, owing to slow progress against the strong wind, and that, finding he was making such slow progress, the pilot drove all his engines at full power, instead of at cruising speed, and that something did break.

There is even the possibility that a sea-bird flew into an airscrew and caused it to break. Here, again, the force of the wind would have nothing to do with the accident, because the relative speeds of the machine and of the bird would be the same either in a gale or in a flat calm.

But the arguments for or against the use of three engines must be considered.

Whenever an accident happens, every possible cause of that accident is worth considering, because even though it may be the wrong explanation, so long as it is a possible explanation it indicates something to be avoided in the future.

Quite often in the old days, when the Aero Club published what its Accidents Committee believed to be the cause of an accident, the explanation given, even when erroneous, did lead to improvements. And for that very reason, one holds that the Air Ministry should publish the findings of its Accidents Committee, even when that Committee is by no means certain of the cause of an accident. The reputed cause of railway accidents are always published, and the Air Ministry ought to follow the same policy.

The other, and more important, lesson to be learned is that, although it was one of the finest flying-boats in the World, G-AADN broke up after a short period on the water. There is no finer flying-boat in the World than the Short Calcutta. The hammering which a similar machine, flown by Sir Alan Cobham, stood when it was nearly wrecked on the coast of Malta, proves its staunchness. But, as has so often been said in this paper for years past, no flying-boat of any type built in the World at present will stand up to a heavy sea.

The hull structure will probably stand anything that the sea can do to it, but wing structures will not stand pounding by waves. And, when the wing-structure breaks up, broken spars and other parts are bound to hammer the hull to pieces sooner or later.

Moreover, when the wings break up, the hull has no stability, and *must* roll over and sink. And if a wing-tip float breaks, as has happened fairly often, that wing-tip may go under and capsize the whole machine.

To prevent such a happening there are possibilities in the twin-hull flying-boat, as patented by Mr. S. E. Saunders years ago, and as used by the Marchese de Pinedo in his flights all over the World. That is one way out. But there is another which seems even more sure.

Over and over again the argument has been put forward in this paper that the only way of assuring safety in sea-going flying-boats is to make the hull a self-contained motor lifeboat which is clamped to the wing-structure and the flying power-plant, and can be released from that structure when the danger-point is reached.

Designs for such a craft were actually produced by the Supermarine Aviation Works either during or immediately after the War 1914-18, but nothing further has been done anywhere in the World to develop that type.

No blame should be put upon our British constructors of flying-boats for this neglect. Flying-boats were so disgracefully neglected after the War, in spite of the magnificent work which they did during the War, that only within the last three or four years have our constructors of flying-boats been able to make even a small profit.

The people to blame are undoubtedly the Air Authorities of all nations where flying-boats are built. In this country alone we spend nearly half a million pounds a year on experimental work, for which we get amazingly small results. For £25,000 or £30,000 (leaving out the price of engines) we could quite easily produce an experimental flying-boat of that type. And very much better types could then be produced as a commercial proposition by all or any of our builders of flying-boats.

Without criticising in any way the policy of our Air Ministry in building our two big airships, the fact remains that for roughly about one-twentieth of the money we have spent on those airships we could have produced several years ago a flying lifeboat which would have made impossible such a disaster as that which occurred off Spezia.

As usual, we have thrown away valuable lives simply because we have been too lazy or too stupid or too self-satisfied to take sound advice when it has been put in front of us, and too jealous to follow a good example when it has been set. And the pity is that the people who suffered are not the people who were basically at fault.

The pilot may have been to blame for carrying on in the face of such a gale. Bad Italian seamanship may have been to blame for clumsiness in breaking tow-ropes, and for not taking off the crew before leaving the flying-boat to its fate. But fundamentally the blame belongs to those who compel people to put to sea in boats which are not seaworthy.—C. G. G.

LUFT HANSA PROGRESS.

As is well known, mail-bags can be picked up and also delivered by railway trains travelling at full speed. Special P.O. sorting coaches are also attached to such a train so that all P.O. work can be done while the train is in motion.

Luft Hansa, who, like all sensible people, realise that air transport is the proper mode of conveyance for mail, are now developing a device for picking up and dropping mail-bags from aircraft in flight. This apparatus is similar to other devices already tried out, and consists of a cable carrying the mail-bag to be dropped and a fork which catches the bag and detaches it. At the same time the trailing rope picks up a disc to which is attached the bag to be collected.

The method is an elaboration of that used by our Army Co-operation aeroplanes for picking up messages, but it delivers and collects at the same time.

"THE CITY OF ROME" DISASTER.

The late editions of the Sunday (Oct. 27) papers reported the loss, on Oct. 26, of the Imperial Airways Short Calcutta G-AADN on the Naples-Genoa section of the airline from India.

The seven persons on board have been drowned. Three bodies had been recovered up to Monday evening.

Those on board *The City of Rome* were:—Pilot, L. S. Birt; engineer, F. T. Pembroke; wireless operator, S. J. Stone. Passengers:—H. Turney, H. K. Robinson, C. Ritchie and Miss Bomford.

The following is a statement made to the Press by an official of Imperial Airways Ltd.

The City of Rome, which is fitted with three engines, bore the registration letters G-AADN. It was the type used on the Mediterranean section of the London-India air mail service. *The City of Rome* was of a similar type to the machine used by Sir Alan Cobham on his 20,000 miles voyage round Africa.

So far as we can make out, the machine, after leaving Naples on the last stage of the flight to Genoa, ran into terrific weather at Leghorn. The wind was terrific and is computed to have exceeded 70 miles an hour. The machine was compelled to come down on to the water about 10 miles south of Spezia. The wireless operator had managed to get an S.O.S. through before this, and the message was answered by the Italian steamer the *Famiglia,* which set out from Genoa and soon found the air liner riding the heavy seas quite well. The Italians managed to get three tow-ropes to the machine, and towed her for an hour.

The seas were so terrific, however, that the three tow-ropes snapped. As the flying-boat was then riding the sea well, the captain went aboard a destroyer which put to sea at 11 p.m. to continue the towing into Spezia. The destroyer was unable, however, to locate the flying-boat, and aircraft, tugs, and destroyers, which left Genoa, Spezia, Viareggio, and Leghorn at dawn, were equally unsuccessful. A change of wind during the night had made conditions at sea worse.

The following account is taken, with full acknowledgment, from *The Times* of Oct. 29. Essential extracts from the dispatch from the Milan Correspondent of that paper read thus:—

The story of the disaster may now be reconstructed as follows:—

The big flying-boat had left the Neapolitan air port of Molo Beverello on Saturday morning with a crew of three and four passengers. The weather was bad and the sea rough, and all the weather bulletins predicted that the journey would be dangerous. Other machines flying on the same route had consequently decided not to make the journey.

Up to Ostia it seems that the flight had been without incident. After a halt at Ostia *The City of Rome* left for Genoa, where it was due at 4.30 p.m. The machine, probably owing to a breakdown of one of the engines, had to alight on the water off the Tuscan coast midway between Bocca d'Arno and Viareggio. S.O.S. signals were sent out at once from the flying-boat, which was floating on the sea lashed by a violent south-westerly gale which threatened to swamp it at any moment.

The wireless stations at Castollaccio, Varignano, near Spezia, and Leghorn immediately broadcast an appeal to steamers in the vicinity giving the position of the seaplane. Several tugs left Leghorn, and from Spezia a destroyer, which was at the time under steam, also went out. One of the tugs and the destroyer were forced by the violence of the sea to return to harbour.

Eventually the crew of the tug *Famiglia,* a vessel with a crew of 15 men commanded by Signor Salvatore Cariglia, succeeded in picking up the lights of the machine. After a great struggle the tug managed to get within 100 yards of *The City of Rome,* but it was impossible, and inadvisable, to approach nearer because the flying-boat might have been flung against the tug and smashed without any hope of rescuing its passengers and crew. The captain clearly saw persons on the flying-boat signalling with their hands.

A cable 250 yards long was then thrown out, and the pilot of the machine succeeded in catching it and fastening it to the nose of the machine. The tug then began to make towards the land at slow speed in order to avoid breaking the cable. The crew of the flying-boat helped by keeping in action her engines, which, apparently, were still efficient.

The towing lasted for a quarter of an hour. Then the cable, unable to stand the strain, snapped. From aboard the tug the crew were able for a few minutes longer to see *The City of Rome* and hear the noise of her engines, but then the small lights disappeared and it was no longer possible to fix the position of the machine.

Three times the tug circled round the spot where the flying-boat was last seen, but nothing was to be found. Nor was the noise of the engines any longer to be heard. As the tug was not provided with wireless, and some of the crew had been injured by shifting deck cargo, the captain decided to put back to Spezia. On arrival there Captain Cariglia went out again on board a destroyer to help further in the quest for *The City of Rome.*

The search was continued yesterday by Italian seaplanes and aeroplanes and a British three-engined machine of Imperial Airways, a twin machine of *The City of Rome,* which left Genoa and cruised over the area. These machines were unable to find any trace of the missing flying-boat.

At the same time the Naval Command of Spezia ordered out the destroyers *Prestinari* and *Nullo,* which closely examined the inlets into which the current would presumably have swept the British machine. In the afternoon at a point 10 miles south-east of the small island of Tino two floating bodies were seen by the crew of the *Prestinari.* The destroyer approached and succeeded in recovering them. They were identified as those of the pilot and the wireless operator.

This morning at dawn the deep-sea tug *Cyclope* and the destroyer *La Masa* left Spezia and continued the search, so far without any result. The British Consul at Spezia, after the formal identification of the bodies, made arrangements for the funeral, which will probably take place on Wednesday.

The following information has been received from a reliable source:—

Twenty minutes before the S.O.S. signal was sent out a wireless message came from the flying-boat that the port engine was failing. Ten minutes later a signal came through that the port engine had stopped, but that the boat was holding its height on two engines.

When the S.O.S. was sent out it was jammed by a ship which was trying out its wireless in Genoa Harbour. The signal was picked up by the Antibes Wireless Station in France and thence was broadcast to the whole of the Mediterranean. By the time a launch could get to the ship in Genoa Harbour to stop the experiments which were jamming the flying-boat's wireless further signals from the boat had ceased.

An inquiry is being held by the Italian authorities at Genoa into the behaviour of the captain and crew of the *Famiglia* for leaving the flying-boat after the towing cable broke.

The local meteorological stations report that the wind at the time of the accident was blowing at a speed of over 100 kilometres per hour (60 m.p.h.). This represents full gale force, but rescues at sea have often been made in such weather.

The captain of the *Famiglia* reported that after he took the flying-boat in tow her middle and starboard engines were running slowly, evidently in the endeavour to help the towing.

The position where the boat must have sunk has been located to within a mile or so, and the depth in that area is about 30 fathoms. The Italian *Regia Aeronautica* (Royal Air Service) have been trying to locate the wreck by aerial photography.

The Victims.

Miss M. Bomford was a daughter of the Rev. Trevor Bomford, who had been a C.M.S. missionary in India for 5[illegible] years. One of her brothers is Lieut.-Colonel Bomford, of the Medical College Hospital, Calcutta. Miss Bomford, who was a trained nurse, had recently visited her parents at Abbottabad, where they are now settled.

Mr. Henry King Robinson, another of the passengers, was a deputy Conservator in the Punjab Forest Department. Mr. Robinson was returning on leave to visit his wife and children.

Mr. H. Turney had been in the Customs House Service at Croydon ever since that establishment began in 1919. He was a capable pilot of Nieuports during the War 1914-18 and though he gave up flying he remained a keen sportsman and an athlete of note. On duty he was strictly official though never officious. Off duty his personal charm won for him a number of firm friends, by whom his death will be deeply mourned.

Mr. S. J. Stone, the wireless operator, and his wife, lived at Genoa. He had been in the service of Imperial Airways since March of this year.

Mr. F. T. Pembroke, the engineer, came from Bournemouth. He, like Mr. Stone, had been with Imperial Airways Ltd. since March of this year.

Mr. Charles Ritchie, whose family live at Lyme Regis, was a member of the staff of Imperial Airways Ltd. He had served as an engineer on the Eastern service and was coming home on expiry of contract.

A note on the flying service of Mr. L. S. Birt, the pilot, appears in the Personal Notices at the end of this paper, as he was an officer of the Reserve of Air Force Officers.

THE LATEST ATLANTIC FAILURE.

On Oct. 22 an American, Mr. U. F. Diteman, left Harbour ace, Newfoundland, at 12.15 p.m. (local time) (5.15 p.m. M.T.) in an attempt to fly to London.

Since his departure, nothing has been seen or heard of ot or machine. Presumably disaster overtook them.

Mr. Diteman, a Montana cattleman, was about 40 years , and only learned to fly a year ago. He was comndably quiet about his intentions, which he kept secret. His machine was a Barling N.B.-3 low-wing monoplane, h either a 100 h.p. engine of some unknown type, or e a 60 h.p. Le Blond five-cylinder air-cooled radial—which the standard for this machine.

He had only 25 gallons (probably American gallons—this uld be only 20 Imperial gallons) on board at the start.

CROYDON NOTES .

Among other unpleasant things a road hog is one who, rough ignorance or malice breaks the rules of the road ade for his own and other people's safety, and convenice, and who also ignores the common courtesies of the ad.—It may interest a certain class of private owner or ot to know that there are rules of the Cross-Channel Air outes, as well as certain courtesies to be observed, and at it is not difficult to find a name for those who are so reless as to ignore the rules, written and unwritten, of e air routes between England and the Continent.

Recently an aeroplane containing three able-bodied men ft Croydon for Paris in baddish weather and landed somenere in France. Doubtless one of the occupants had to ay by the machine for a time, but it is supposed that all ree were able to obtain food, drink, warmth and good eds as well as petrol to continue the journey. Where petrol , there is usually a telephone, yet no news was heard of em until they fetched up smiling in Paris next morning. hese worthies were hailed as "missing airmen" in the ress and they probably looked upon the whole thing as o end of a lark.

The point is that the average air-line pilot would sooner alk five miles in a blizzard to telephone on such an ccasion, because he knows that the Control-Tower officer s his best friend and never lets him down, and a moment's hought should convince any pilot how serious as well as ow discourteous it is to do a silly "disappearing trick" of his sort.

The consequence of this particular caper was that the Control-Tower officer was kept busy all night trying to race people who were perfectly safe and sound, and the elatives of the worthies in question spent a night of acute nxiety and had to be soothed and reassured by the Traffic fficer.

The answer to it all is that a pilot is not competent to lo more than circle his municipal aerodrome until he has nade himself acquainted with the ordinary rules of the air outes, written and unwritten, and part of the curriculum f every pupil learning to fly should be a course of instruction on behaviour when using the regular air routes.

It is easier for a camel to pass through the eye of a needle han for a plump pilot to attain unto the cockpit of a Hercules. Steps are being taken, however, not to widen he door for the pilots, but to streamline the pilots to fit he door.

Some pilots have settled down to the 18-day-diet and may e seen mournfully husking the day's soya-bean or grapefruit pip, while others have purchased examples of almost extinct full-length corsets of late Victorian days, and are getting their wives to lace them up good and tight at the back. Pilots who creak in future will not be accused of gout or smothered hiccoughs, but will be pitied as victims of the tight-lacing vogue, or possibly even of the 18-day-diet.

Mr. Wilcockson is to take the newly-delivered Hercules, which has an enclosed cockpit by the way, if and when you get in to it, to India one day this week.

Anthony Fokker hit London from the States the other day and 'phoned Amsterdam for the new Fokker F.IX to come and meet him at Croydon and take him back to Holland. Mr. Hondong of the K.L.M. flew the machine over and Major Segrave came to Croydon for a flight in her. He handled the F.IX in the air and expressed himself highly pleased with her performance.

Mr. Fokker himself flew her back to Amsterdam on Friday morning last. He produced several photographs of the Fokker F.23 four-engine monoplane which he has constructed in America for 23 passengers, and he says is a very successful aeroplane.

The F.IX has three 450 Jupiters and gets off the ground with eighteen passengers on two of them. She cruises at 110 m.p.h. or over and has a covered cockpit like a small conservatory.

She will, of course, be fitted with a tail wheel and is already fitted with brakes. The cabin is very wide and looks like giving real passenger comfort, and the average man can stand upright in a bowler hat in the cabin without stunning himself.

Somebody asked Mr. Fokker why only 18 passengers with three Jupiters, and he replied that the plane would probably carry 40 for all he knew or cared or words to that effect. The K.L.M., who will probably have three of these aeroplanes on the London line next Summer, feel that to carry 18 passengers in real comfort and real safety at a real speed is better than to collar the extra few pounds sterling from a couple more passengers.

Two K.L.M. pilots, one outward bound from Amsterdam and one on the homeward journey, met, dipped a wing in greeting and passed on as usual. The meeting took place over the Ganges Delta and the pilots were Smirnoff and Beekman in one machine and Fryns and Soer in the other. [NOTE:—There is no British Air Line to do that yet.—C. G. G.]

On October 26 a wireless warning was sent out about an obstruction in the N.E. corner of Lympne Aerodrome. It is understood that *Geraldine* of *The Daily Mail*, landing at Lympne after dark on the 25th in the N.E. corner did not observe any such obstruction. The mystery has not yet been solved.—SPRY.

THE LONDON TERMINAL AERODROME.

ANALYSIS OF FIGURES FOR PAST WEEK.

Trips per Day.—Sunday, 12; Monday, 22; Tuesday, 26; Wednesday, 24; Thursday, 26; Friday, 30; Saturday, 21.

IMPERIAL AIRWAYS LTD.:
London—Egypt—India: London—Le Touquet—Paris—Basle—Zurich: London—Ostend—Brussels—Cologne and return: Machines 50, passengers 560, freight 27¼ tons. India Route: Inward, passengers 0, mail 0 lbs.; outward, passengers 2, mail 782 lbs.

AIR UNION:
Paris—London: Machines 44, passengers 244, freight 2¾ tons.

COMPANY NEWS.

New Company.

Rymers Air Lines Ltd.—Private company. Registered Sept. 11. Capital £100 in £1 shares. Objects: To own, hire or control aeroplanes, flying-boats or any known or future vehicles or devices of any kinds for the transportation of goods or passengers by air, to operate air line services, to provide garages, etc. The first directors (to number not less than 2 nor more than 5) are C. F. Rymer, 17, James Street, Liverpool, accountant. Olive M. Williams, 28, Oxford Road, Wallasey, secretary. Qualification: One share. Registered office: 17, James Street, Liverpool.

Satisfactions.

Land, Air and Water Services Ltd.—Satisfaction in full on Oct. 17, of debentures dated Sept. 30, 1929, securing £600.

PERSONAL NOTICES.

Deaths.

BIRT.—On Oct. 26, in the Gulf of Genoa, as the result of an accident to the Imperial Airways flying-boat *City of Rome*, Lascelles Spence Birt, Reserve of Air Force Officers.

Mr. L. S. Birt was born in 1902 and entered the R.A.F. with a short-service commission in July, 1924. After a course of flying training at No. 2, F.T.S., Digby, he was posted to No. 1 (Fighter) Squadron, then at Hinaidi, 'Iraq. He was promoted to Flying Officer in February, 1926, and in November, 1926, he was posted to No. 84 (Bomber) Squadron, Shaibah, Basrah.

He was restored to the Home Establishment in July, 1927, and posted to the staff of No. 2, F.T.S., Digby. In March, 1928, he was posted to the Flying Boat Development Flight, Felixstowe. He passed to the Reserve in January, 1929.

Mr. Birt flew a Blackburn Bluebird in the King's Cup Race of 1928, but had a forced landing and failed to finish the course.

WALMSLEY.—At Hinaidi, 'Iraq, on Oct. 24, as the result of a flying accident, Cpl. William Walmsley, No. 55 (B) Sqdn., R.A.F.

Marriages.

DESMOND—FRASER.—The marriage took place at Cowes, Isle of Wight, on Oct. 10, of Flt. Lt. Thomas Joseph Desmond, R.A.F., Manston, Kent, and Miss Elsie Fraser, only daughter of the late Colonel Fraser and Mrs. Fraser, of The White Cottage, East Cowes.

McINTOSH—ANSELL.—On Oct. 26, at the Savoy Chapel, R. H. McIntosh (Flg. Off., R.A.F.O.), of Imperial Airways, to Betty, daughter of Mr. W. R. Ansell.

Births.

CAHILL.—On Oct. 12, at Felixstowe, to Flt. Lt. and Mrs. C. H. Cahill—a daughter.

STARKEY.—On Oct. 23, at 2, Spring Grove Gardens, Richmond, to Sqdn. Ldr. and Mrs. H. S. Crichton Starkey—a son.

WEARE.—On Oct. 23, at Ferndale Lodge, Tunbridge Wells, to Nell (*née* Cherry-Downes), wife of Flt. Lt. F. G. C. Weare, M.C.—a son.

REYNOLDS

Evidence of high standard of our Aircraft Tubing is shown by its extensive use by the leading Aircraft Constructors.

Reynolds Tubes are manufactured to all specifications in any of the following forms:

Round and Special Sections.
Taper Gauge for Axles, etc.
Manipulated Tubes of all descriptions including Built-up Components (Welded).

Anything in Steel Tubing for Aircraft.

Lane, 162, Sydenham Road North, Croydon, Surrey.

SALES.

Advice.
The soundest advice comes from those with the longest EXPERIENCE. The greatest knowledge of aeroplanes is held by the PRACTICAL people who have had most to do with them. Any aeroplane purchased from the Brooklands School of Flying is sold by men who have been flying, handling and maintaining aircraft *continuously* since the days of Bleriots.

Your New Aeroplane.
This experience tells us that the MOTH is the finest aeroplane of its type obtainable. That is why we are SALES & SERVICE AGENTS for MOTHS. And that is why YOUR aeroplane should be a MOTH.

Service.
The way your aeroplane is treated during the first month's flying will go a long way to deciding how it will treat its owner. WE OFFER ONE MONTH'S FREE MAINTENANCE TO ALL PURCHASERS FROM US OF NEW MOTHS.

Tuition.
The most expert tuition obtainable is offered to purchasers of new MOTHS from us at REDUCED RATES.

Used Aeroplanes.
Second-hand aircraft bought from us all hold Air Ministry Certificates of Airworthiness, and are *flown and demonstrated* by our own pilots.

Hire Purchase & Part Exchange.
Aircraft, new or second-hand, may be purchased from us at the MOST FAVOURABLE HIRE PURCHASE RATES. Having the second-hand aeroplane and car market at our finger tips, we can offer the best allowances for part-exchanging CARS AND AEROPLANES.

ON MOTORLESS FLYING.

For some curious reason there seems to be a sudden growth of interest in motorless flying, or, as it is commonly called, gliding, in this country. Gliding is a game which has much to recommend it purely as a sport, and probably there is still more value in it as a means of scientific research.
